

PRODUCT PLAN | OCTOBER 2026

Pweb

A multi-practice booking platform for surgeries

Plan, architecture, page map and roadmap

Prepared for Patrick Lubisi

1. The idea

Build one Pweb application that many surgeries can use, each with its own branding, specialists, opening hours and data. A patient books online, gets reminders, completes pre-admission forms and manages appointments. Reception and specialists run the day from a simple dashboard.

Why practices will pay

- Fewer no-shows through automatic SMS or WhatsApp reminders.
- Less reception time spent on phone bookings and rescheduling.
- Patients can book at night and on weekends, which a phone line cannot offer.
- A modern, branded patient experience for each practice.

Verdict

Worth pursuing. The hard parts are less the code and more validation, compliance and support. Start narrow, prove value with one pilot practice, then widen.

2. Validate before building

Talk to 3 to 5 surgeries before writing the real product.

- How do you take bookings today (phone, WhatsApp, paper, software)?
- What practice management software do you already use?
- What costs you the most time or money (no-shows, double bookings, admin)?
- Would you replace your current system or want something that sits beside it?
- What would you pay per month if it removed that pain?

Integration with existing software is often what decides adoption, so find out early.

3. Version 1 scope

A narrow product that never double-books beats a wide one that is flaky.

In version 1	Later
Online booking and live availability	Pre-admission forms (version 1.5)
Specialist calendars and leave	Medical insurance quotes and purchase
SMS / WhatsApp reminders	Payments and deposits
Patient login, reschedule and cancel	Waitlist and cancellations fill
Reception dashboard	Reports and analytics
Practice branding and settings	Custom domains
	Integrations with other software

4. Architecture for many practices

Topic	Approach
Multi-tenancy	One codebase and one database. Every row carries a <code>practice_id</code> . Enforce isolation with Postgres row-level security so a buggy query cannot leak data.
Per-practice settings	Name, logo, colours, specialists, services, hours and messaging stored as data. Your template already works this way.
Addressing	Subdomain per practice at first (example: <code>kloof.pweb.app</code>). Custom domains later.
Roles	Platform owner, practice admin, reception, specialist, patient. Build roles from day one.
Booking integrity	Create bookings inside a database transaction with a unique slot constraint so two people can never take the same slot.
Audit log	Record who viewed or changed what, and when. Essential for health data.
Suggested stack	Next.js front end, Supabase (Postgres, auth, row-level security), an SMS or WhatsApp provider, email provider, hosting with a region that matches your compliance needs.

5. Where to start: build order

Navigation is done. Build these as simple linked HTML pages first with fake data, so you have a clickable prototype to show practices.

0
Navigation
Top bar, search, login, appointment button.
DONE

1
Home page
Hero, search and the four quick actions.

3
Booking flow
Pick a day and time, confirm. The heart of the product. **MEDIUM**

4
Confirmation + My dashboard
What patients see after booking. **SMALL**

5
Reception calendar
The day view staff would use. **MEDIUM**

6
Branding admin
Change colours and logo and see it live. **SMALL**

Structure and design tokens

Phase 1 is a plain HTML prototype using the CSS you already have. When a practice says yes, the same pages move into the real app and tokens.css carries over unchanged.

NOW · PROTOTYPE
pweb-prototype/
index.html Home
specialists.html Find a specialist
book.html 3-step booking
confirmed.html Confirmation

DESIGN TOKENS (PUT THESE IN TOKENS.CSS)

Ink #0b1220

Deep #1d4ed8

Blue #2563eb

Sky #38bdf8

Soft #93c5fd

Page #f4f7fb

White #ffffff

Font: Space Grotesk Radius: 12 to 18px Buttons: pill shaped Cards: white, thin border One blue accent per screen

6. Page designs

Clean white screens, deep blue accents, big readable type, rounded cards. Design sketches with sample content.

Page 1: Home

First impression with the four quick actions front and centre.

Page 2: Find a specialist

Filter by specialty and see next available times on each card.

Page 3: Book an appointment

Three simple steps with a live summary. The most important page to get right.

Page 4: Confirmation

Reassure the patient and tell them what to bring.

Page 5: My dashboard

Upcoming visits, forms to finish, reschedule and cancel in one place.

Page 6: Reception calendar

One column per specialist. Drag to move, colour shows the type of visit.

Page 7: Branding admin

Each practice sets its own name, logo and colour and sees a live preview. This is your selling point.

7. Full page list

Four areas: what patients see, what reception sees, what specialists see, and what practice admins and you control.

7.1 Patient-facing pages (public site per practice)

Page	Purpose and key content
Home	Hero ("Advanced surgical care for every stage of life"), quick actions (book, pre-admission, insurance, register), emergency number, trust signals.
Find a specialist	Search and filter by name, specialty or location. Cards show photo, specialty and next available times.
Specialist profile	Bio, qualifications, services, rooms, availability preview, Book button.
Book appointment	3-step flow: choose specialist and service, pick a time, enter details and consent. Slot is held for a few minutes while the patient completes it.
Booking confirmation	Summary, add-to-calendar, directions, what to bring, SMS and email sent.
Pre-admission forms	Secure forms for history, medication and consent, saved as progress is made. Reception sees completion status.
Login and register (MyPweb Online)	Email or phone sign-in with one-time code. Optional password.
My dashboard	Upcoming and past appointments, reschedule, cancel, forms to complete, messages.
Insurance	Plain information first, quote request later. Do not sell insurance in version 1.
Locations and contact	Map, hours, parking, accessibility, phone and emergency instructions.
About and careers	Practice story, team, open roles.
Privacy and terms	Privacy policy, consent wording, cookie notice, how patient data is used.

7.2 Reception and staff pages

Page	Purpose and key content
Today dashboard	Day calendar by specialist, arrivals, no-shows, quick actions.
Calendar	Day, week and month views. Drag to reschedule. Colour by status.
New booking (phone)	Fast form for bookings taken by phone or in person, using the same availability rules.
Appointment detail	Patient contact, status, forms completed, notes, history of changes.
Patients	Search with minimal visible fields. Every view is logged.
Waitlist	Patients wanting earlier times. Offer freed slots by SMS.
Messages and reminders	Template editor, send log, delivery status.

7.3 Specialist pages

Page	Purpose and key content
My schedule	Their own appointments, patient forms, notes.
Availability	Working hours, theatre days, leave, blocked time, slot length per service.

7.4 Practice admin and platform pages

Page	Purpose and key content
Branding	Logo, colours, practice name, home page text and slides (your device showcase becomes editable per practice).
Specialists and services	Add or edit specialists, specialties, services, durations and rooms.
Hours and holidays	Opening hours, public holidays, closures.
Users and roles	Invite staff, set role, deactivate.
Reports	Bookings, no-show rate, busiest days, reminder performance.
Audit log	Who viewed or changed what, exportable.
Platform: practices	Create a practice, set subdomain and plan, status.
Platform: billing and support	Subscriptions, invoices, support tools with logged access, uptime status.

Patient booking experience

One responsive layout: the same HTML and CSS, three sizes. Book, confirm, manage.

DESKTOP

Calendar and summary side by side

TABLET

Two-column card grid

PHONE

Single column, tab bar

HTML Structure

- 1 <header><nav> with a menu <button> for phone
- 2 Stepper as an ; the booking is one <form>
- 3 Calendar days are <button>s in a grid (keyboard friendly)
- 4 Time slots are radio inputs styled as chips
- 5 <aside> summary with an aria-live region
 - <dialog> for reschedule and cancel confirmations
 - Real labels, alt text, landmark roles for accessibility

CSS Look and responsive

- Tokens in :root: colours, radius, spacing, font
- 1 Sticky header; hamburger below 768px
- 3 Calendar with display:grid; repeat(7,1fr)
- 6 Cards: grid, repeat(auto-fit, minmax(220px,1fr))
- 7 Bottom tab bar fixed on phone only
- Mobile first with breakpoints at 480, 768 and 1024px
- :focus-visible, reduced motion, light and dark support

JS Interactivity

- 3 renderCalendar(month): disable past and full days
- 4 getSlots(date, specialist) then render chips
- 5 state = {specialist, date, time}; updateSummary()
 - Hold the slot 5 min with a countdown, then release
- 2 Validate the step before moving to the next
- 6 Filter specialists by specialty with no reload
 - Confirm: POST booking, show confirmation, send SMS

Reception and practice control

Staff run the day on desktop, adjust settings on tablet and check in on their phone.

DESKTOP

Calendar with a detail panel

TABLET

Icon sidebar, form plus live preview

PHONE

Quick glance and check-in

HTML Structure

- App shell: <aside> nav, <header>, <main>
- Calendar built with CSS grid, events are <button>s
- Detail panel is an <aside> or <dialog> on small screens
- Settings in a <form> with real <label>s and <input type=color>
- Role attributes: data-role="admin | reception | specialist"
 - Tables for patients with sortable <th> headers
 - Skip link, landmarks and focus order for keyboard use

CSS Look and responsive

- Layout: grid-template-columns 240px 1fr, icon-only on tablet
- Sticky column headers, event colour from status tokens
- Brand colour stored as a CSS variable (--brand)
- Phone: bottom nav and stacked cards
- Detail panel slides in with transform and transition
 - Print stylesheet for the daily appointment sheet
 - Dark mode and high contrast through the same tokens

JS Interactivity

- Drag to reschedule with pointer events and a clash check
- Filter by specialist or status, search with debounce
- Click an event to open the detail and load forms status
- Colour picker sets --brand live in the preview
 - Realtime subscription: new bookings appear with a toast
 - Show or hide sections by role; log every view and edit
- Tap to mark Arrived, No-show or Cancelled with undo

10. Compliance and trust

This is health data, so compliance matters as much as features. If you target South Africa, POPIA applies and health information is special personal information. Other regions bring GDPR or HIPAA. I am not a lawyer, so have one review your terms, privacy policy and practice agreements before real patients use it.

- Explicit patient consent captured and stored with a timestamp.
- Encryption in transit and at rest, strong access control, multi-factor sign-in for staff.
- Access and change logs, data retention and deletion rules.
- Decide where data is hosted and document it.
- A data processing (operator) agreement with each practice.
- A written breach response plan and backups that are tested.
- Collect only what a booking needs. Keep clinical notes out of version 1.

11. Business and rollout

- Run a pilot with one friendly surgery, free or discounted, in exchange for weekly feedback.
- Price as a flat monthly fee per practice, with setup help included at first.
- Sales will be local and relationship based. Let the pilot practice refer you.
- Plan for support and uptime. Once reception depends on it, outages matter.
- Keep a clear scope in the agreement so custom requests do not swamp you.

12. Roadmap

Phase	Goal	Outcome
0. Discover (2 weeks)	Interview 3 to 5 practices	Confirmed pain points and pilot partner
1. Prototype (3 to 4 weeks)	Clickable booking flow using your template	Feedback from reception and patients
2. MVP (6 to 8 weeks)	Booking, calendars, reminders, reception dashboard, branding	Pilot practice live with real bookings
3. Harden (4 weeks)	Audit log, backups, role checks, legal review	Safe to onboard more practices
4. Grow	Pre-admission forms, payments, reports, custom domains	Second and third practice, recurring revenue

13. Next steps this week

- Pick 3 surgeries to interview and book the conversations.
- Choose the pilot candidate and agree what success looks like.
- Turn the current template pages into a clickable prototype.

- Sketch the database tables: practices, specialists, services, availability, appointments, patients, users.
- Speak to a lawyer about POPIA and the practice agreement.

Timeframes are rough estimates for one developer working part-time to full-time and will change once scope is confirmed.
