      if (currentNode.right) queue.push(currentNode.right);
    }
  }

  return null;
};
```

1603 Design Parking System

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1603. Design Parking System
 * https://leetcode.com/problems/design-parking-system/
 * Difficulty: Easy
 *
 * Design a parking system for a parking lot. The parking lot has three kinds of parking
 * spaces: big, medium, and small, with a fixed number of slots for each size.
 *
 * Implement the ParkingSystem class:
 * - ParkingSystem(int big, int medium, int small) Initializes object of the ParkingSystem
class.
 *   The number of slots for each parking space are given as part of the constructor.
 * - bool addCar(int carType) Checks whether there is a parking space of carType for the car
that
 *   wants to get into the parking lot. carType can be of three kinds: big, medium, or small,
which
 *   are represented by 1, 2, and 3 respectively. A car can only park in a parking space of
its
 *   carType. If there is no space available, return false, else park the car in that size
space
 *   and return true.
 */

/**
 * @param {number} big
 * @param {number} medium
 * @param {number} small
 */
var ParkingSystem = function(big, medium, small) {
```

```
  this.spaces = { 1: big, 2: medium, 3: small };
};

/**
 * @param {number} carType
 * @return {boolean}
 */
ParkingSystem.prototype.addCar = function(carType) {
  if (this.spaces[carType] > 0) {
    this.spaces[carType]--;
    return true;
  }
  return false;
};
```

1604 Alert Using Same Key Card Three Or More Times In A One Hour Period

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1604. Alert Using Same Key-Card Three or More Times in a One Hour Period
 * https://leetcode.com/problems/alert-using-same-key-card-three-or-more-times-in-a-one-hour-p
eriod/
 * Difficulty: Medium
 *
 * LeetCode company workers use key-cards to unlock office doors. Each time a worker uses
their
 * key-card, the security system saves the worker's name and the time when it was used. The
system
 * emits an alert if any worker uses the key-card three or more times in a one-hour period.
 *
 * You are given a list of strings keyName and keyTime where [keyName[i], keyTime[i]]
corresponds
 * to a person's name and the time when their key-card was used in a single day.
 *
 * Access times are given in the 24-hour time format "HH:MM", such as "23:51" and "09:49".
 *
 * Return a list of unique worker names who received an alert for frequent keycard use. Sort
the
 * names in ascending order alphabetically.
 *
 * Notice that "10:00" - "11:00" is considered to be within a one-hour period, while
 * "22:51" - "23:52" is not considered to be within a one-hour period.
 */

/**
 * @param {string[]} keyName
 * @param {string[]} keyTime
 * @return {string[]}
 */
var alertNames = function(keyName, keyTime) {
  const usageMap = new Map();
  for (let i = 0; i < keyName.length; i++) {
    if (!usageMap.has(keyName[i])) {
      usageMap.set(keyName[i], []);
    }
    usageMap.get(keyName[i]).push(timeToMinutes(keyTime[i]));
  }

  const result = [];
  for (const [name, times] of usageMap) {
    times.sort((a, b) => a - b);
    for (let i = 2; i < times.length; i++) {

        result.push(name);
        break;
      }
    }
  }
```

```
  return result.sort();

  function timeToMinutes(time) {
    const [hours, minutes] = time.split(':').map(Number);
    return hours * 60 + minutes;
  }
};
```

1605 Find Valid Matrix Given Row And Column Sums

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1605. Find Valid Matrix Given Row and Column Sums
 * https://leetcode.com/problems/find-valid-matrix-given-row-and-column-sums/
 * Difficulty: Medium
 *
 * You are given two arrays rowSum and colSum of non-negative integers where rowSum[i] is the
sum
 * of the elements in the ith row and colSum[j] is the sum of the elements of the jth column
of a
 * 2D matrix. In other words, you do not know the elements of the matrix, but you do know the
sums
 * of each row and column.
 *
 * Find any matrix of non-negative integers of size rowSum.length x colSum.length that
satisfies
 * the rowSum and colSum requirements.
 *
 * Return a 2D array representing any matrix that fulfills the requirements. It's guaranteed
that
 * at least one matrix that fulfills the requirements exists.
 */

/**
 * @param {number[]} rowSum
 * @param {number[]} colSum
 * @return {number[][]}
 */
var restoreMatrix = function(rowSum, colSum) {

    for (let j = 0; j < cols; j++) {
      const value = Math.min(rowSum[i], colSum[j]);
      matrix[i][j] = value;
      rowSum[i] -= value;
      colSum[j] -= value;
    }
  }

  return matrix;
};
```

1606 Find Servers That Handled Most Number Of Requests

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1606. Find Servers That Handled Most Number of Requests
 * https://leetcode.com/problems/find-servers-that-handled-most-number-of-requests/
```

```
 * Difficulty: Hard
 *
 * You have k servers numbered from 0 to k-1 that are being used to handle multiple requests
 * simultaneously. Each server has infinite computational capacity but cannot handle more than
 * one request at a time. The requests are assigned to servers according to a specific
algorithm:
 * - The ith (0-indexed) request arrives.
 * - If all servers are busy, the request is dropped (not handled at all).
 * - If the (i % k)th server is available, assign the request to that server.
 * - Otherwise, assign the request to the next available server (wrapping around the list of
servers
 *   and starting from 0 if necessary). For example, if the ith server is busy, try to assign
the
 *   request to the (i+1)th server, then the (i+2)th server, and so on.
 *
 * You are given a strictly increasing array arrival of positive integers, where arrival[i]
 * represents the arrival time of the ith request, and another array load, where load[i]
represents
 * the load of the ith request (the time it takes to complete). Your goal is to find the
busiest
 * server(s). A server is considered busiest if it handled the most number of requests
successfully
 * among all the servers.
 *
 * Return a list containing the IDs (0-indexed) of the busiest server(s). You may return the
IDs
 * in any order.
 */

/**
 * @param {number} k
 * @param {number[]} arrival
 * @param {number[]} load
 * @return {number[]}
 */
var busiestServers = function(k, arrival, load) {
  const requests = new Array(k).fill(0);

1610 Maximum Number Of Visible Points

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1610. Maximum Number of Visible Points
 * https://leetcode.com/problems/maximum-number-of-visible-points/
 * Difficulty: Hard
 *
 * You are given an array points, an integer angle, and your location, where location = [posx,
 posy]
 * and points[i] = [xi, yi] both denote integral coordinates on the X-Y plane.
 *
 * Initially, you are facing directly east from your position. You cannot move from your
position,
 * but you can rotate. In other words, posx and posy cannot be changed. Your field of view in
 * degrees is represented by angle, determining how wide you can see from any given view
direction.
 * Let d be the amount in degrees that you rotate counterclockwise. Then, your field of view
is the
 * inclusive range of angles [d - angle/2, d + angle/2].
 *
 * You can see some set of points if, for each point, the angle formed by the point, your
position,
 * and the immediate east direction from your position is in your field of view.
 *
 * There can be multiple points at one coordinate. There may be points at your location, and
you
 * can always see these points regardless of your rotation. Points do not obstruct your vision
 to
 * other points.
 *
 * Return the maximum number of points you can see.
 */

1617 Count Subtrees With Max Distance Between Cities

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1617. Count Subtrees With Max Distance Between Cities
 * https://leetcode.com/problems/count-subtrees-with-max-distance-between-cities/
 * Difficulty: Hard
 *
 * There are n cities numbered from 1 to n. You are given an array edges of size n-1, where
```

```
 * edges[i] = [ui, vi] represents a bidirectional edge between cities ui and vi. There exists
 * a unique path between each pair of cities. In other words, the cities form a tree.
 *
 * A subtree is a subset of cities where every city is reachable from every other city in the
 * subset, where the path between each pair passes through only the cities from the subset.
 * Two subtrees are different if there is a city in one subtree that is not present in the
other.
 *
 * For each d from 1 to n-1, find the number of subtrees in which the maximum distance between
 * any two cities in the subtree is equal to d.
 *
 * Return an array of size n-1 where the dth element (1-indexed) is the number of subtrees in
 * which the maximum distance between any two cities is equal to d.
 *
 * Notice that the distance between the two cities is the number of edges in the path between
them.
 */

/**

1618 Maximum Font To Fit A Sentence In A Screen

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1618. Maximum Font to Fit a Sentence in a Screen
 * https://leetcode.com/problems/maximum-font-to-fit-a-sentence-in-a-screen/
 * Difficulty: Medium
 *
 * You are given a string text. We want to display text on a screen of width w and height h.
 * You can choose any font size from array fonts, which contains the available font sizes in
 * ascending order.
 *
 * You can use the FontInfo interface to get the width and height of any character at any
 * available font size.
 *
 * The FontInfo interface is defined as such:
 * interface FontInfo {
 *   // Returns the width of character ch on the screen using font size fontSize.
 *   // O(1) per call
 *   public int getWidth(int fontSize, char ch);
 *
 *   // Returns the height of any character on the screen using font size fontSize.
 *   // O(1) per call
 *   public int getHeight(int fontSize);
 * }
 *
 * The calculated width of text for some fontSize is the sum of every
 * getWidth(fontSize, text[i]) call for each 0 <= i < text.length (0-indexed).
 * The calculated height of text for some fontSize is getHeight(fontSize). Note
 * that text is displayed on a single line.
 *
 * It is guaranteed that FontInfo will return the same value if you call getHeight
 * or getWidth with the same parameters.
 *
 * It is also guaranteed that for any font size fontSize and any character ch:
 * - getHeight(fontSize) <= getHeight(fontSize+1)
 * - getWidth(fontSize, ch) <= getWidth(fontSize+1, ch)
 *
 * Return the maximum font size you can use to display text on the screen. If text cannot
 * fit on the display with any font size, return -1.
 */

/**
 * // This is the FontInfo's API interface.
 * // You should not implement it, or speculate about its implementation
 * function FontInfo() {
 *
 *  @param {number} fontSize
 *  @param {char} ch
 *      @return {number}
 *      this.getWidth = function(fontSize, ch) {
 *       ...
 *      };
 *
 *  @param {number} fontSize
 *      @return {number}
 *      this.getHeight = function(fontSize) {
 *       ...
 *      };
 * };
 */
```

```

```

1620 Coordinate With Maximum Network Quality

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1620. Coordinate With Maximum Network Quality
 * https://leetcode.com/problems/coordinate-with-maximum-network-quality/
 * Difficulty: Medium
 *
 * You are given an array of network towers towers, where towers[i] = [xi, yi, qi] denotes the
 * ith network tower with location (xi, yi) and quality factor qi. All the coordinates are
 * integral coordinates on the X-Y plane, and the distance between the two coordinates is the
 * Euclidean distance.
 *
 * You are also given an integer radius where a tower is reachable if the distance is less
than
 * or equal to radius. Outside that distance, the signal becomes garbled, and the tower is not
 * reachable.
 *
 * The signal quality of the ith tower at a coordinate (x, y) is calculated with the formula
 * ■qi / (1 + d)■, where d is the distance between the tower and the coordinate. The network
 * quality at a coordinate is the sum of the signal qualities from all the reachable towers.
 *
 * Return the array [cx, cy] representing the integral coordinate (cx, cy) where the network
 * quality is maximum. If there are multiple coordinates with the same network quality, return
 * the lexicographically minimum non-negative coordinate.
 *
 * Note:
 * - A coordinate (x1, y1) is lexicographically smaller than (x2, y2) if either:
 *   - x1 < x2, or
 *   - x1 == x2 and y1 < y2.
 * - ■val■ is the greatest integer less than or equal to val (the floor function).

1625 Lexicographically Smallest String After Applying Operations

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1625. Lexicographically Smallest String After Applying Operations
 * https://leetcode.com/problems/lexicographically-smallest-string-after-applying-operations/
 * Difficulty: Medium
 *
 * You are given a string s of even length consisting of digits from 0 to 9, and two integers
a
 * and b.
 *
 * You can apply either of the following two operations any number of times and in any order
on s:
 * - Add a to all odd indices of s (0-indexed). Digits post 9 are cycled back to 0. For
example,
 *   if s = "3456" and a = 5, s becomes "3951".
 * - Rotate s to the right by b positions. For example, if s = "3456" and b = 1, s becomes
"6345".
 *
 * Return the lexicographically smallest string you can obtain by applying the above
operations any
 * number of times on s.
 *
 * A string a is lexicographically smaller than a string b (of the same length) if in the
first
 * position where a and b differ, string a has a letter that appears earlier in the alphabet
than
 * the corresponding letter in b. For example, "0158" is lexicographically smaller than "0190"
 * because the first position they differ is at the third letter, and '5' comes before '9'.
 */

/**
 * @param {string} s
 * @param {number} a
 * @param {number} b
 * @return {string}
 */

1627 Graph Connectivity With Threshold

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1627. Graph Connectivity With Threshold
 * https://leetcode.com/problems/graph-connectivity-with-threshold/
 * Difficulty: Hard
 *
 * We have n cities labeled from 1 to n. Two different cities with labels x and y are directly
 * connected by a bidirectional road if and only if x and y share a common divisor strictly
 * greater than some threshold. More formally, cities with labels x and y have a road between
 * them if there exists an integer z such that all of the following are true:
 * - x % z == 0,
 * - y % z == 0, and
 * - z > threshold.
 *
 * Given the two integers, n and threshold, and an array of queries, you must determine for
each
 * queries[i] = [ai, bi] if cities ai and bi are connected directly or indirectly. (i.e. there
 * is some path between them).
 *
 * Return an array answer, where answer.length == queries.length and answer[i] is true if for
 * the ith query, there is a path between ai and bi, or answer[i] is false if there is no
path.
 */

  }
};
```

1628 Design An Expression Tree With Evaluate Function

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1628. Design an Expression Tree With Evaluate Function
 * https://leetcode.com/problems/design-an-expression-tree-with-evaluate-function/
 * Difficulty: Medium
 *
 * Given the postfix tokens of an arithmetic expression, build and return the binary
expression
 * tree that represents this expression.
 *
 * Postfix notation is a notation for writing arithmetic expressions in which the operands
 * (numbers) appear before their operators. For example, the postfix tokens of the expression
 * 4*(5-(7+2)) are represented in the array postfix = ["4","5","7","2","+","-","*"].
 *
 * The class Node is an interface you should use to implement the binary expression tree.
 * The returned tree will be tested using the evaluate function, which is supposed to evaluate
 * the tree's value. You should not remove the Node class; however, you can modify it as you
 * wish, and you can define other classes to implement it if needed.
 *
 * A binary expression tree is a kind of binary tree used to represent arithmetic expressions.
 * Each node of a binary expression tree has either zero or two children. Leaf nodes (nodes
 * with 0 children) correspond to operands (numbers), and internal nodes (nodes with two
 * children) correspond to the operators '+' (addition), '-' (subtraction), '*'
 * (multiplication), and '/' (division).
 *
 * It's guaranteed that no subtree will yield a value that exceeds 109 in absolute value,
 * and all the operations are valid (i.e., no division by zero).
 *
 * Follow up: Could you design the expression tree such that it is more modular? For example,
 * is your design able to support additional operators without making changes to your existing
 * evaluate implementation?
 */

1629 Slowest Key

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1629. Slowest Key
 * https://leetcode.com/problems/slowest-key/
 * Difficulty: Easy
 *
 * A newly designed keypad was tested, where a tester pressed a sequence of n keys, one at a
time.
 *
 * You are given a string keysPressed of length n, where keysPressed[i] was the ith key
pressed in
 * the testing sequence, and a sorted list releaseTimes, where releaseTimes[i] was the time
the
 * ith key was released. Both arrays are 0-indexed. The 0th key was pressed at the time 0, and
 * every subsequent key was pressed at the exact time the previous key was released.
 *
 * The tester wants to know the key of the keypress that had the longest duration. The ith
keypress
 * had a duration of releaseTimes[i] - releaseTimes[i - 1], and the 0th keypress had a
duration of
 * releaseTimes[0].
 *
 * Note that the same key could have been pressed multiple times during the test, and these
multiple
 * presses of the same key may not have had the same duration.
```

```
 *
 * Return the key of the keypress that had the longest duration. If there are multiple such
 * keypresses, return the lexicographically largest key of the keypresses.
 */

/**
 * @param {number[]} releaseTimes
 * @param {string} keysPressed
 * @return {character}
 */
var slowestKey = function(releaseTimes, keysPressed) {
  let maxDuration = releaseTimes[0];
  let result = keysPressed[0];

  for (let i = 1; i < releaseTimes.length; i++) {
    const duration = releaseTimes[i] - releaseTimes[i - 1];
    if (duration > maxDuration || (duration === maxDuration && keysPressed[i] > result)) {
      maxDuration = duration;
      result = keysPressed[i];
    }
  }

  return result;
};
```

1630 Arithmetic Subarrays

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1630. Arithmetic Subarrays
 * https://leetcode.com/problems/arithmetic-subarrays/
 * Difficulty: Medium
 *
 * A sequence of numbers is called arithmetic if it consists of at least two elements, and the
 * difference between every two consecutive elements is the same. More formally, a sequence s
 * is arithmetic if and only if s[i+1] - s[i] == s[1] - s[0] for all valid i.
 *
 * For example, these are arithmetic sequences:
 * - 1, 3, 5, 7, 9
 * - 7, 7, 7, 7
 * - 3, -1, -5, -9
 *
 * The following sequence is not arithmetic:
 * - 1, 1, 2, 5, 7
 *
 * You are given an array of n integers, nums, and two arrays of m integers each, l and r,
 * representing the m range queries, where the ith query is the range [l[i], r[i]]. All the
 * arrays are 0-indexed.
 *
 * Return a list of boolean elements answer, where answer[i] is true if the subarray
 * nums[l[i]], nums[l[i]+1], ... , nums[r[i]] can be rearranged to form an arithmetic
 * sequence, and false otherwise.
 */

/**
 * @param {number[]} nums
 * @param {number[]} l
 * @param {number[]} r
 * @return {boolean[]}
 */

    }
  }

  return result;
};
```

1632 Rank Transform Of A Matrix

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1632. Rank Transform of a Matrix
 * https://leetcode.com/problems/rank-transform-of-a-matrix/
 * Difficulty: Hard
 *
 * Given an m x n matrix, return a new matrix answer where answer[row][col] is the rank of
 * matrix[row][col].
 *
 * The rank is an integer that represents how large an element is compared to other elements.
 * It is calculated using the following rules:
 * - The rank is an integer starting from 1.
 * - If two elements p and q are in the same row or column, then:
 *   - If p < q then rank(p) < rank(q)
 *   - If p == q then rank(p) == rank(q)
 *   - If p > q then rank(p) > rank(q)
 * - The rank should be as small as possible.
 *
 * The test cases are generated so that answer is unique under the given rules.

1634 Add Two Polynomials Represented As Linked Lists

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1634. Add Two Polynomials Represented as Linked Lists
 * https://leetcode.com/problems/add-two-polynomials-represented-as-linked-lists/
 * Difficulty: Medium
 *
 * A polynomial linked list is a special type of linked list where every node represents a
 * term in a polynomial expression.
 *
 * Each node has three attributes:
 * - coefficient: an integer representing the number multiplier of the term. The coefficient
 *   of the term 9x4 is 9.
 * - power: an integer representing the exponent. The power of the term 9x4 is 4.
 * - next: a pointer to the next node in the list, or null if it is the last node of the list.
 *
 * For example, the polynomial 5x3 + 4x - 7 is represented by the polynomial linked list
 * illustrated below:
 *
 * The polynomial linked list must be in its standard form: the polynomial must be in strictly
 * descending order by its power value. Also, terms with a coefficient of 0 are omitted.
 *
 * Given two polynomial linked list heads, poly1 and poly2, add the polynomials together
 * and return the head of the sum of the polynomials.
 *
 * PolyNode format:
 * The input/output format is as a list of n nodes, where each node is represented as
 * its [coefficient, power]. For example, the polynomial 5x3 + 4x - 7 would be represented
 * as: [[5,3],[4,1],[-7,0]].
 */

/**
 * Definition for polynomial singly-linked list.
 * function PolyNode(x=0, y=0, next=null) {
 *     this.coefficient = x;
 *     this.power = y;
 *     this.next = next;
 * }
 */

/**
 * @param {PolyNode} poly1
 * @param {PolyNode} poly2
 * @return {PolyNode}
 */
var addPoly = function(poly1, poly2) {

1639 Number Of Ways To Form A Target String Given A Dictionary

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1639. Number of Ways to Form a Target String Given a Dictionary
 * https://leetcode.com/problems/number-of-ways-to-form-a-target-string-given-a-dictionary/
 * Difficulty: Hard
 *
 * You are given a list of strings of the same length words and a string target.
 *
 * Your task is to form target using the given words under the following rules:
 * - target should be formed from left to right.
 * - To form the ith character (0-indexed) of target, you can choose the kth character of the
jth
 *   string in words if target[i] = words[j][k].
 * - Once you use the kth character of the jth string of words, you can no longer use the xth
 *   character of any string in words where x <= k. In other words, all characters to the left
 of
 *   or at index k become unusuable for every string.
 * - Repeat the process until you form the string target.
 *
 * Notice that you can use multiple characters from the same string in words provided the
 * conditions above are met.
 *
 * Return the number of ways to form target from words. Since the answer may be too large,
return
 * it modulo 109 + 7.
 */

1643 Kth Smallest Instructions

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1643. Kth Smallest Instructions
 * https://leetcode.com/problems/kth-smallest-instructions/
```

```
 * Difficulty: Hard
 *
 * Bob is standing at cell (0, 0), and he wants to reach destination: (row, column). He can
only
 * travel right and down. You are going to help Bob by providing instructions for him to reach
 * destination.
 *
 * The instructions are represented as a string, where each character is either:
 * - 'H', meaning move horizontally (go right), or
 * - 'V', meaning move vertically (go down).
 *
 * Multiple instructions will lead Bob to destination. For example, if destination is (2, 3),
 * both "HHHVV" and "HVHVH" are valid instructions.
 *
 * However, Bob is very picky. Bob has a lucky number k, and he wants the kth
lexicographically
 * smallest instructions that will lead him to destination. k is 1-indexed.
 *
 * Given an integer array destination and an integer k, return the kth lexicographically
 * smallest instructions that will take Bob to destination.
 */

/**
 * @param {number[]} destination
 * @param {number} k
 * @return {string}
 */
var kthSmallestPath = function(destination, k) {
  let verticalMoves = destination[0];
  let horizontalMoves = destination[1];
  const totalMoves = verticalMoves + horizontalMoves;
  let path = '';

  for (let i = 0; i < totalMoves; i++) {
    if (horizontalMoves === 0) {
      path += 'V';
      verticalMoves--;
      continue;
    }
    const combinations = calculateCombinations(
      verticalMoves + horizontalMoves - 1,
      horizontalMoves - 1
    );
    if (k <= combinations) {
      path += 'H';
      horizontalMoves--;
    } else {
      path += 'V';
      verticalMoves--;
      k -= combinations;
    }
  }

  return path;
};

    }
  }

  return maximumValue;
};
```

1647 Minimum Deletions To Make Character Frequencies Unique

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1647. Minimum Deletions to Make Character Frequencies Unique
 * https://leetcode.com/problems/minimum-deletions-to-make-character-frequencies-unique/
 * Difficulty: Medium
 *
 * A string s is called good if there are no two different characters in s that have the
 * same frequency.
 *
 * Given a string s, return the minimum number of characters you need to delete to make s
good.
 *
 * The frequency of a character in a string is the number of times it appears in the string.
 * For example, in the string "aab", the frequency of 'a' is 2, while the frequency of 'b' is
1.
 */

/**
 * @param {string} s
 * @return {number}
 */
var minDeletions = function(s) {
  const charFrequencies = new Array(26).fill(0);
  for (const char of s) {
    charFrequencies[char.charCodeAt(0) - 97]++;
  }

  charFrequencies.sort((a, b) => b - a);
  let result = 0;
```

```
  const usedFrequencies = new Set();

  for (const freq of charFrequencies) {
    if (freq === 0) break;
    let currentFreq = freq;
    while (usedFrequencies.has(currentFreq) && currentFreq > 0) {
      currentFreq--;
      result++;
    }
    usedFrequencies.add(currentFreq);
  }

  return result;
};
```

1648 Sell Diminishing Valued Colored Balls

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1648. Sell Diminishing-Valued Colored Balls
 * https://leetcode.com/problems/sell-diminishing-valued-colored-balls/
 * Difficulty: Medium
 *
 * You have an inventory of different colored balls, and there is a customer that wants orders
 * balls of any color.
 *
 * The customer weirdly values the colored balls. Each colored ball's value is the number of
balls
 * of that color you currently have in your inventory. For example, if you own 6 yellow balls,
 * the customer would pay 6 for the first yellow ball. After the transaction, there are only 5
 * yellow balls left, so the next yellow ball is then valued at 5 (i.e., the value of the
balls
 * decreases as you sell more to the customer).
 *
 * You are given an integer array, inventory, where inventory[i] represents the number of
balls of
 * the ith color that you initially own. You are also given an integer orders, which
represents
 * the total number of balls that the customer wants. You can sell the balls in any order.
 *
 * Return the maximum total value that you can attain after selling orders colored balls. As
the
 * answer may be too large, return it modulo 109 + 7.
 */

/**
 * @param {number[]} inventory
 * @param {number} orders
 * @return {number}
 */
var maxProfit = function(inventory, orders) {

  let totalProfit = 0;
  let currentColor = 0;
  let ballsSold = 0;

  while (ballsSold < orders) {
    const currentCount = inventory[currentColor];
    const nextCount = inventory[currentColor + 1];
    const colors = currentColor + 1;
    const ballsToSell = Math.min(
      orders - ballsSold,
      colors * (currentCount - nextCount)
    );

    const fullSets = Math.floor(ballsToSell / colors);
```

```
    const remainder = ballsToSell % colors;

    if (fullSets > 0) {
      const endValue = currentCount - fullSets + 1;
      let sequenceSum = (BigInt(colors) * BigInt(fullSets) % BigInt(MOD))
        * (BigInt(currentCount) + BigInt(endValue)) % BigInt(MOD);
      sequenceSum = (sequenceSum * BigInt(500000004)) % BigInt(MOD);
      totalProfit = (totalProfit + Number(sequenceSum)) % MOD;
    }

    if (remainder > 0) {
      totalProfit = (totalProfit + (remainder * (currentCount - fullSets)) % MOD) % MOD;
    }

    ballsSold += ballsToSell;
    currentColor++;
  }

  return totalProfit;
};
```

1649 Create Sorted Array Through Instructions

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1649. Create Sorted Array through Instructions
 * https://leetcode.com/problems/create-sorted-array-through-instructions/
 * Difficulty: Hard
 *
 * Given an integer array instructions, you are asked to create a sorted array from the
elements in
 * instructions. You start with an empty container nums. For each element from left to right
in
 * instructions, insert it into nums. The cost of each insertion is the minimum of the
following:
 * - The number of elements currently in nums that are strictly less than instructions[i].
 * - The number of elements currently in nums that are strictly greater than instructions[i].
 *
 * For example, if inserting element 3 into nums = [1,2,3,5], the cost of insertion is min(2,
1)
 * (elements 1 and 2 are less than 3, element 5 is greater than 3) and nums will become
[1,2,3,3,5].
 *
 * Return the total cost to insert all elements from instructions into nums. Since the answer
may
 * be large, return it modulo 109 + 7
 */

/**
 * @param {number[]} instructions
 * @return {number}
 */

1659 Maximize Grid Happiness

HARD

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 1659. Maximize Grid Happiness
 * https://leetcode.com/problems/maximize-grid-happiness/
 * Difficulty: Hard
 *
 * You are given four integers, m, n, introvertsCount, and extrovertsCount. You have an m x n
grid,
 * and there are two types of people: introverts and extroverts. There are introvertsCount
 * introverts and extrovertsCount extroverts.
 *
 * You should decide how many people you want to live in the grid and assign each of them one
grid
 * cell. Note that you do not have to have all the people living in the grid.
 *
 * The happiness of each person is calculated as follows:
 * - Introverts start with 120 happiness and lose 30 happiness for each neighbor (introvert or
 *   extrovert).
 * - Extroverts start with 40 happiness and gain 20 happiness for each neighbor (introvert or
 *   extrovert).
 *
 * Neighbors live in the directly adjacent cells north, east, south, and west of a person's
cell.
 *
 * The grid happiness is the sum of each person's happiness. Return the maximum possible grid
 * happiness.
 */

1660 Correct A Binary Tree

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 1660. Correct a Binary Tree
 * https://leetcode.com/problems/correct-a-binary-tree/
 * Difficulty: Medium
 *
 * You have a binary tree with a small defect. There is exactly one invalid node where its
right
 * child incorrectly points to another node at the same depth but to the invalid node's right.
 *
 * Given the root of the binary tree with this defect, root, return the root of the binary
```

```
tree
 * after removing this invalid node and every node underneath it (minus the node it
incorrectly
 * points to).
 *
 * Custom testing:
 * The test input is read as 3 lines:
 * - TreeNode root
 * - int fromNode (not available to correctBinaryTree)
 * - int toNode (not available to correctBinaryTree)
 *
 * After the binary tree rooted at root is parsed, the TreeNode with value of fromNode will
have
 * its right child pointer pointing to the TreeNode with a value of toNode. Then, root is
passed
 * to correctBinaryTree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} from

    set.add(node);

    node.right = traverse(node.right, node, false);
    node.left = traverse(node.left, node, true);

    return node;
  }
};
```

1662 Check If Two String Arrays Are Equivalent

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1662. Check If Two String Arrays are Equivalent
 * https://leetcode.com/problems/check-if-two-string-arrays-are-equivalent/
 * Difficulty: Easy
 *
 * Given two string arrays word1 and word2, return true if the two arrays represent the same
 * string, and false otherwise.
```

```
 *
 * A string is represented by an array if the array elements concatenated in order forms the
string.
 */

/**
 * @param {string[]} word1
 * @param {string[]} word2
 * @return {boolean}
 */
var arrayStringsAreEqual = function(word1, word2) {
  return word1.join('') === word2.join('');
};
```

1663 Smallest String With A Given Numeric Value

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1663. Smallest String With A Given Numeric Value
 * https://leetcode.com/problems/smallest-string-with-a-given-numeric-value/
 * Difficulty: Medium
 *
 * The numeric value of a lowercase character is defined as its position (1-indexed) in the
 * alphabet, so the numeric value of a is 1, the numeric value of b is 2, the numeric value
 * of c is 3, and so on.
 *
 * The numeric value of a string consisting of lowercase characters is defined as the sum of
 * its characters' numeric values. For example, the numeric value of the string "abe" is equal
 * to 1 + 2 + 5 = 8.
 *
 * You are given two integers n and k. Return the lexicographically smallest string with
length
 * equal to n and numeric value equal to k.
 *
 * Note that a string x is lexicographically smaller than string y if x comes before y in
 * dictionary order, that is, either x is a prefix of y, or if i is the first position
 * such that x[i] != y[i], then x[i] comes before y[i] in alphabetic order.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {string}
 */
var getSmallestString = function(n, k) {
  const result = new Array(n).fill('a');
  let remainingValue = k - n;

  for (let i = n - 1; i >= 0 && remainingValue > 0; i--) {
    const addValue = Math.min(25, remainingValue);
    result[i] = String.fromCharCode(97 + addValue);
    remainingValue -= addValue;
  }

  return result.join('');
};
```

1664 Ways To Make A Fair Array

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1664. Ways to Make a Fair Array
 * https://leetcode.com/problems/ways-to-make-a-fair-array/
```

```
 * Difficulty: Medium
 *
 * You are given an integer array nums. You can choose exactly one index (0-indexed) and
remove
 * the element. Notice that the index of the elements may change after the removal.
 *
 * For example, if nums = [6,1,7,4,1]:
 * - Choosing to remove index 1 results in nums = [6,7,4,1].
 * - Choosing to remove index 2 results in nums = [6,1,4,1].
 * - Choosing to remove index 4 results in nums = [6,1,7,4].
 *
 * An array is fair if the sum of the odd-indexed values equals the sum of the even-indexed
values.
 *
 * Return the number of indices that you could choose such that after the removal, nums is
fair.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var waysToMakeFair = function(nums) {
  let evenSum = 0;
  let oddSum = 0;
  let result = 0;

  for (let i = 0; i < nums.length; i++) {
    if (i % 2 === 0) evenSum += nums[i];
    else oddSum += nums[i];
  }

  let currentEven = 0;
  let currentOdd = 0;

  for (let i = 0; i < nums.length; i++) {
    if (i % 2 === 0) {
      evenSum -= nums[i];
      if (currentEven + oddSum === currentOdd + evenSum) result++;
      currentEven += nums[i];
    } else {
      oddSum -= nums[i];
      if (currentEven + oddSum === currentOdd + evenSum) result++;
      currentOdd += nums[i];
    }
  }

  return result;
};
```

1665 Minimum Initial Energy To Finish Tasks

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1665. Minimum Initial Energy to Finish Tasks
 * https://leetcode.com/problems/minimum-initial-energy-to-finish-tasks/
 * Difficulty: Hard
 *
 * You are given an array tasks where tasks[i] = [actuali, minimumi]:
 * - actuali is the actual amount of energy you spend to finish the ith task.
 * - minimumi is the minimum amount of energy you require to begin the ith task.
 *
 * For example, if the task is [10, 12] and your current energy is 11, you cannot start
 * this task. However, if your current energy is 13, you can complete this task, and your
 * energy will be 3 after finishing it.
 *
 * You can finish the tasks in any order you like.
 *
 * Return the minimum initial amount of energy you will need to finish all the tasks.
```

```
 */

/**
 * @param {number[][]} tasks
 * @return {number}
 */
var minimumEffort = function(tasks) {
  tasks.sort((a, b) => (b[1] - b[0]) - (a[1] - a[0]));
  let result = 0;
  let currentEnergy = 0;

  for (const [actual, minimum] of tasks) {
    if (currentEnergy < minimum) {
      result += minimum - currentEnergy;
      currentEnergy = minimum;
    }
    currentEnergy -= actual;
  }

  return result;
};
```

1666 Change The Root Of A Binary Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1666. Change the Root of a Binary Tree
 * https://leetcode.com/problems/change-the-root-of-a-binary-tree/
 * Difficulty: Medium
 *
 * Given the root of a binary tree and a leaf node, reroot the tree so that the leaf is the
 * new root.
 *
 * You can reroot the tree with the following steps for each node cur on the path starting
 * from the leaf up to the root excluding the root:
 * 1. If cur has a left child, then that child becomes cur's right child.
 * 2. cur's original parent becomes cur's left child. Note that in this process the original
 *    parent's pointer to cur becomes null, making it have at most one child.
 *
 * Return the new root of the rerooted tree.
 *
 * Note: Ensure that your solution sets the Node.parent pointers correctly after rerooting or
 * you will receive "Wrong Answer".
 */

/**
 * // Definition for a Node.
 * function Node(val) {
 *    this.val = val;
 *    this.left = null;
 *    this.right = null;
 *    this.parent = null;
 * };
 */

/**
 * @param {Node} node
 * @return {Node}
 */

    node.parent = newParent;
    if (!originalParent) return;

    if (node.left) node.right = node.left;
```

```
    node.left = originalParent;

    if (originalParent.left === node) {
      originalParent.left = null;
    } else {
      originalParent.right = null;
    }

    helper(originalParent, node);
  }
};
```

1668 Maximum Repeating Substring

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1668. Maximum Repeating Substring
 * https://leetcode.com/problems/maximum-repeating-substring/
 * Difficulty: Easy
 *
 * For a string sequence, a string word is k-repeating if word concatenated k times is a
substring
 * of sequence. The word's maximum k-repeating value is the highest value k where word is
k-repeating
 * in sequence. If word is not a substring of sequence, word's maximum k-repeating value is 0.
 *
 * Given strings sequence and word, return the maximum k-repeating value of word in sequence.
 */

/**
 * @param {string} sequence
 * @param {string} word
 * @return {number}
 */
var maxRepeating = function(sequence, word) {
  let count = Math.floor(sequence.length / word.length) + 1;
  while (--count) {
    if (sequence.includes(word.repeat(count))) return count;
  }
  return count;
};
```

1669 Merge In Between Linked Lists

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1669. Merge In Between Linked Lists
 * https://leetcode.com/problems/merge-in-between-linked-lists/
 * Difficulty: Medium
 *
 * You are given two linked lists: list1 and list2 of sizes n and m respectively.
 *
 * Remove list1's nodes from the ath node to the bth node, and put list2 in their place.
 *
 * The blue edges and nodes in the following figure indicate the result:
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
```

```
 */
/**
 * @param {ListNode} list1
 * @param {number} a
 * @param {number} b
 * @param {ListNode} list2
 * @return {ListNode}
 */
var mergeInBetween = function(list1, a, b, list2) {
  const result = new ListNode(0, list1);

  for (let i = 1; i < a; i++) {
    list1 = list1.next;
  }
  let tail = list1.next;
  list1.next = list2;
  for (let i = a; i < b; i++) {
    tail = tail.next;
  }
  while (list1 && list1.next) {
    list1 = list1.next;
  }
  list1.next = tail.next;

  return result.next;
};
```

1670 Design Front Middle Back Queue

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1670. Design Front Middle Back Queue
 * https://leetcode.com/problems/design-front-middle-back-queue/
 * Difficulty: Medium
 *
 * Design a queue that supports push and pop operations in the front, middle, and back.
 *
 * Implement the FrontMiddleBack class:
 * - FrontMiddleBack() Initializes the queue.
 * - void pushFront(int val) Adds val to the front of the queue.
 * - void pushMiddle(int val) Adds val to the middle of the queue.
 * - void pushBack(int val) Adds val to the back of the queue.
 * - int popFront() Removes the front element of the queue and returns it. If the queue is
 *   empty, return -1.
 * - int popMiddle() Removes the middle element of the queue and returns it. If the queue is
 *   empty, return -1.
 * - int popBack() Removes the back element of the queue and returns it. If the queue is
 *   empty, return -1.
 *
 * Notice that when there are two middle position choices, the operation is performed on the
 * frontmost middle position choice. For example:
 * - Pushing 6 into the middle of [1, 2, 3, 4, 5] results in [1, 2, 6, 3, 4, 5].
 * - Popping the middle from [1, 2, 3, 4, 5, 6] returns 3 and results in [1, 2, 4, 5, 6].
 */

var FrontMiddleBackQueue = function() {

    }
  }

  return aliceScore > bobScore ? 1 : aliceScore < bobScore ? -1 : 0;
};
```

1687 Delivering Boxes From Storage To Ports

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1687. Delivering Boxes from Storage to Ports
 * https://leetcode.com/problems/delivering-boxes-from-storage-to-ports/
 * Difficulty: Hard
 *
 * You have the task of delivering some boxes from storage to their ports using only one ship.
 * However, this ship has a limit on the number of boxes and the total weight that it can
carry.
 *
 * You are given an array boxes, where boxes[i] = [portsi, weighti], and three integers
 * portsCount, maxBoxes, and maxWeight.
 * - portsi is the port where you need to deliver the ith box and weightsi is the weight of
```

```
 *   the ith box.
 * - portsCount is the number of ports.
 * - maxBoxes and maxWeight are the respective box and weight limits of the ship.
 *
 * The boxes need to be delivered in the order they are given. The ship will follow these
steps:
 * - The ship will take some number of boxes from the boxes queue, not violating the maxBoxes
and
 *   maxWeight constraints.
 * - For each loaded box in order, the ship will make a trip to the port the box needs to be
 *   delivered to and deliver it. If the ship is already at the correct port, no trip is
needed,
 *   and the box can immediately be delivered.
 * - The ship then makes a return trip to storage to take more boxes from the queue.
 *
 * The ship must end at storage after all the boxes have been delivered.
 *
 * Return the minimum number of trips the ship needs to make to deliver all boxes to their
 * respective ports.
 */

/**
 * @param {number[][]} boxes
 * @param {number} portsCount
 * @param {number} maxBoxes
 * @param {number} maxWeight
 * @return {number}
 */
var boxDelivering = function(boxes, portsCount, maxBoxes, maxWeight) {
  const n = boxes.length;

```

1694 Reformat Phone Number

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1694. Reformat Phone Number
 * https://leetcode.com/problems/reformat-phone-number/
 * Difficulty: Easy
 *
 * You are given a phone number as a string number. number consists of digits, spaces ' ',
 * and/or dashes '-'.
 *
 * You would like to reformat the phone number in a certain manner. Firstly, remove all spaces
 * and dashes. Then, group the digits from left to right into blocks of length 3 until there
 * are 4 or fewer digits. The final digits are then grouped as follows:
 * - 2 digits: A single block of length 2.
```

```
 * - 3 digits: A single block of length 3.
 * - 4 digits: Two blocks of length 2 each.
 *
 * The blocks are then joined by dashes. Notice that the reformatting process should never
produce
 * any blocks of length 1 and produce at most two blocks of length 2.
 *
 * Return the phone number after formatting.
 */

/**
 * @param {string} number
 * @return {string}
 */
var reformatNumber = function(number) {
  const digits = number.replace(/[^0-9]/g, '');
  const blocks = [];
  let i = 0;

  while (i < digits.length) {
    const remaining = digits.length - i;
    if (remaining > 4) {
      blocks.push(digits.slice(i, i + 3));
      i += 3;
    } else if (remaining === 4) {
      blocks.push(digits.slice(i, i + 2), digits.slice(i + 2));
      break;
    } else if (remaining === 2 || remaining === 3) {
      blocks.push(digits.slice(i));
      break;
    }
  }

  return blocks.join('-');
};
```

1695 Maximum Erasure Value

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1695. Maximum Erasure Value
 * https://leetcode.com/problems/maximum-erasure-value/
 * Difficulty: Medium
 *
 * You are given an array of positive integers nums and want to erase a subarray containing
unique
 * elements. The score you get by erasing the subarray is equal to the sum of its elements.
 *
 * Return the maximum score you can get by erasing exactly one subarray.
 *
 * An array b is called to be a subarray of a if it forms a contiguous subsequence of a, that
is,
 * if it is equal to a[l],a[l+1],...,a[r] for some (l,r).
 */

/**
 * @param {number[]} nums
 * @return {number}
 */

  return set.size;
};
```

1700 Number Of Students Unable To Eat Lunch

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1700. Number of Students Unable to Eat Lunch
 * https://leetcode.com/problems/number-of-students-unable-to-eat-lunch/
 * Difficulty: Easy
 *
 * The school cafeteria offers circular and square sandwiches at lunch break, referred to by
 * numbers 0 and 1 respectively. All students stand in a queue. Each student either prefers
 * square or circular sandwiches.
 *
 * The number of sandwiches in the cafeteria is equal to the number of students. The
sandwiches
 * are placed in a stack. At each step:
 * - If the student at the front of the queue prefers the sandwich on the top of the stack,
they
 *   will take it and leave the queue.
 * - Otherwise, they will leave it and go to the queue's end.
 *
 * This continues until none of the queue students want to take the top sandwich and are thus
 * unable to eat.
 *
 * You are given two integer arrays students and sandwiches where sandwiches[i] is the type of
 * the ith sandwich in the stack (i = 0 is the top of the stack) and students[j] is the
 * preference of the jth student in the initial queue (j = 0 is the front of the queue).
 * Return the number of students that are unable to eat.
 */

/**
 * @param {number[]} students
 * @param {number[]} sandwiches
 * @return {number}
 */
var countStudents = function(students, sandwiches) {

```

1713 Minimum Operations To Make A Subsequence

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1713. Minimum Operations to Make a Subsequence
 * https://leetcode.com/problems/minimum-operations-to-make-a-subsequence/
 * Difficulty: Hard
 *
 * You are given an array target that consists of distinct integers and another integer array
 * arr that can have duplicates.
 *
 * In one operation, you can insert any integer at any position in arr. For example, if
 * arr = [1,4,1,2], you can add 3 in the middle and make it [1,4,3,1,2]. Note that you can
 * insert the integer at the very beginning or end of the array.
 *
 * Return the minimum number of operations needed to make target a subsequence of arr.
 *
 * A subsequence of an array is a new array generated from the original array by deleting some
 * elements (possibly none) without changing the remaining elements' relative order. For
 * example, [2,7,4] is a subsequence of [4,2,3,7,2,1,4] (the underlined elements),
 * while [2,4,2] is not.
 */

/**
 * @param {number[]} target
 * @param {number[]} arr
 * @return {number}
 */
```

```
var minOperations = function(target, arr) {
  const valueToIndex = new Map(target.map((val, i) => [val, i]));
  const sequence = arr.filter(val => valueToIndex.has(val)).map(val => valueToIndex.get(val));

1718 Construct The Lexicographically Largest Valid Sequence

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1718. Construct the Lexicographically Largest Valid Sequence
 * https://leetcode.com/problems/construct-the-lexicographically-largest-valid-sequence/
 * Difficulty: Medium
 *
 * Given an integer n, find a sequence that satisfies all of the following:
 * - The integer 1 occurs once in the sequence.
 * - Each integer between 2 and n occurs twice in the sequence.
 * - For every integer i between 2 and n, the distance between the two occurrences of i is
 *   exactly i.
 *
 * The distance between two numbers on the sequence, a[i] and a[j], is the absolute difference
 * of their indices, |j - i|.
 *
 * Return the lexicographically largest sequence. It is guaranteed that under the given
 * constraints, there is always a solution.
 *
 * A sequence a is lexicographically larger than a sequence b (of the same length) if in the
first
```

```
 * position where a and b differ, sequence a has a number greater than the corresponding
number in
 * b. For example, [0,1,9,0] is lexicographically larger than [0,1,5,6] because the first
position
 * they differ is at the third number, and 9 is greater than 5.
 */

1719 Number Of Ways To Reconstruct A Tree

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1719. Number Of Ways To Reconstruct A Tree
 * https://leetcode.com/problems/number-of-ways-to-reconstruct-a-tree/
 * Difficulty: Hard
 *
 * You are given an array pairs, where pairs[i] = [xi, yi], and:
 * - There are no duplicates.
 * - xi < yi
 *
 * Let ways be the number of rooted trees that satisfy the following conditions:
 * - The tree consists of nodes whose values appeared in pairs.
 * - A pair [xi, yi] exists in pairs if and only if xi is an ancestor of yi or yi is
 *   an ancestor of xi.
 * - Note: the tree does not have to be a binary tree.
 *
 * Two ways are considered to be different if there is at least one node that has different
 * parents in both ways.
```

```
 *
 * Return:
 * - 0 if ways == 0
 * - 1 if ways == 1
 * - 2 if ways > 1
 *
 * A rooted tree is a tree that has a single root node, and all edges are oriented to be
 * outgoing from the root.
 *
 * An ancestor of a node is any node on the path from the root to that node (excluding
 * the node itself). The root has no ancestors.
 */

1725 Number Of Rectangles That Can Form The Largest Square

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1725. Number Of Rectangles That Can Form The Largest Square
 * https://leetcode.com/problems/number-of-rectangles-that-can-form-the-largest-square/
 * Difficulty: Easy
 *
 * You are given an array rectangles where rectangles[i] = [li, wi] represents the ith
rectangle
 * of length li and width wi.
 *
 * You can cut the ith rectangle to form a square with a side length of k if both k <= li and
 * k <= wi. For example, if you have a rectangle [4,6], you can cut it to get a square with a
 * side length of at most 4.
 *
 * Let maxLen be the side length of the largest square you can obtain from any of the given
 * rectangles.
 *
 * Return the number of rectangles that can make a square with a side length of maxLen.
 */

/**
 * @param {number[][]} rectangles
 * @return {number}
 */

  for (const [length, width] of rectangles) {
    const side = Math.min(length, width);
    if (side > maxSide) {
      maxSide = side;
      result = 1;
    } else if (side === maxSide) {
      result++;
    }
  }

  return result;
};
```

1726 Tuple With Same Product

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1726. Tuple with Same Product
 * https://leetcode.com/problems/tuple-with-same-product/
 * Difficulty: Medium
 *
 * Given an array nums of distinct positive integers, return the number of tuples (a, b, c, d)
 * such that a * b = c * d where a, b, c, and d are elements of nums, and a != b != c != d.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var tupleSameProduct = function(nums) {
  const map = new Map();
  let count = 0;

  for (let i = 0; i < nums.length; i++) {
    for (let j = i + 1; j < nums.length; j++) {
      map.set(nums[i] * nums[j], map.get(nums[i] * nums[j]) + 1 || 1);
    }
  }

  Array.from(map).forEach(([key, value]) => {
    count += value > 1 ? value * (value - 1) / 2 : 0;
  });

  return count * 8;
};
```

1727 Largest Submatrix With Rearrangements

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1727. Largest Submatrix With Rearrangements
 * https://leetcode.com/problems/largest-submatrix-with-rearrangements/
 * Difficulty: Medium
 *
 * You are given a binary matrix matrix of size m x n, and you are allowed to rearrange the
 * columns of the matrix in any order.
 *
 * Return the area of the largest submatrix within matrix where every element of the submatrix
 * is 1 after reordering the columns optimally.
 */

/**
 * @param {number[][]} matrix
 * @return {number}
 */
var largestSubmatrix = function(matrix) {

    }
  }
```

```
  return result;
};
```

1728 Cat And Mouse Ii

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1728. Cat and Mouse II
 * https://leetcode.com/problems/cat-and-mouse-ii/
 * Difficulty: Hard
 *
 * A game is played by a cat and a mouse named Cat and Mouse.
 *
 * The environment is represented by a grid of size rows x cols, where each element is a wall,
 * floor, player (Cat, Mouse), or food.
 * - Players are represented by the characters 'C'(Cat),'M'(Mouse).
 * - Floors are represented by the character '.' and can be walked on.
 * - Walls are represented by the character '#' and cannot be walked on.
 * - Food is represented by the character 'F' and can be walked on.
 * - There is only one of each character 'C', 'M', and 'F' in grid.
 *
 * Mouse and Cat play according to the following rules:
 * - Mouse moves first, then they take turns to move.
 * - During each turn, Cat and Mouse can jump in one of the four directions (left, right, up,
down).
 *   They cannot jump over the wall nor outside of the grid.
 * - catJump, mouseJump are the maximum lengths Cat and Mouse can jump at a time,
respectively.
 *   Cat and Mouse can jump less than the maximum length.
 * - Staying in the same position is allowed.
 * - Mouse can jump over Cat.
 *
 * The game can end in 4 ways:
 * - If Cat occupies the same position as Mouse, Cat wins.
 * - If Cat reaches the food first, Cat wins.
 * - If Mouse reaches the food first, Mouse wins.
 * - If Mouse cannot get to the food within 1000 turns, Cat wins.
 *
 * Given a rows x cols matrix grid and two integers catJump and mouseJump, return true if
Mouse
 * can win the game if both Cat and Mouse play optimally, otherwise return false.
 */

1739 Building Boxes

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1739. Building Boxes
 * https://leetcode.com/problems/building-boxes/
 * Difficulty: Hard
 *
 * You have a cubic storeroom where the width, length, and height of the room are all equal to
 n
 * units. You are asked to place n boxes in this room where each box is a cube of unit side
 * length. There are however some rules to placing the boxes:
 * - You can place the boxes anywhere on the floor.
 * - If box x is placed on top of the box y, then each side of the four vertical sides of the
box
 *   y must either be adjacent to another box or to a wall.
 *
 * Given an integer n, return the minimum possible number of boxes touching the floor.
 */

/**
 * @param {number} n
 * @return {number}
 */
var minimumBoxes = function(n) {
  if (n < 4) return n;

  let baseSize = 0;
  let totalBoxes = 0;

1754 Largest Merge Of Two Strings

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1754. Largest Merge Of Two Strings
 * https://leetcode.com/problems/largest-merge-of-two-strings/
 * Difficulty: Medium
 *
 * You are given two strings word1 and word2. You want to construct a string merge in the
 * following way: while either word1 or word2 are non-empty, choose one of the following
 * options:
 * - If word1 is non-empty, append the first character in word1 to merge and delete it from
word1.
 *   - For example, if word1 = "abc" and merge = "dv", then after choosing this operation,
 *     word1 = "bc" and merge = "dva".
 * - If word2 is non-empty, append the first character in word2 to merge and delete it from
word2.
 *   - For example, if word2 = "abc" and merge = "", then after choosing this operation,
 *     word2 = "bc" and merge = "a".
 *
 * Return the lexicographically largest merge you can construct.
 *
 * A string a is lexicographically larger than a string b (of the same length) if in the first
 * position where a and b differ, a has a character strictly larger than the corresponding
 * character in b. For example, "abcd" is lexicographically larger than "abcc" because the
 * first position they differ is at the fourth character, and d is greater than c.
 */

/**
 * @param {string} word1
 * @param {string} word2
 * @return {string}
 */

 * Difficulty: Easy
 *
 * You are given a string s consisting only of the characters '0' and '1'. In one operation,
you can
 * change any '0' to '1' or vice versa.
 *
 * The string is called alternating if no two adjacent characters are equal. For example, the
string
 * "010" is alternating, while the string "0100" is not.
 *
 * Return the minimum number of operations needed to make s alternating.
 */

/**
 * @param {string} s
 * @return {number}
 */
var minOperations = function(s) {
  let changesToZeroStart = 0;
  let changesToOneStart = 0;

  for (let i = 0; i < s.length; i++) {
```

```
    const expectedZeroStart = i % 2 === 0 ? '0' : '1';
    const expectedOneStart = i % 2 === 0 ? '1' : '0';
    if (s[i] !== expectedZeroStart) changesToZeroStart++;
    if (s[i] !== expectedOneStart) changesToOneStart++;
  }

  return Math.min(changesToZeroStart, changesToOneStart);
};
```

1759 Count Number Of Homogenous Substrings

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1759. Count Number of Homogenous Substrings
 * https://leetcode.com/problems/count-number-of-homogenous-substrings/
 * Difficulty: Medium
 *
 * Given a string s, return the number of homogenous substrings of s. Since the answer may be
 * too large, return it modulo 109 + 7.
 *
 * A string is homogenous if all the characters of the string are the same.
 *
 * A substring is a contiguous sequence of characters within a string.
 */

/**
 * @param {string} s
 * @return {number}
 */

  }

  result = (result + (streak * (streak + 1) / 2)) % mod;

  return result;
};
```

1760 Minimum Limit Of Balls In A Bag

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1760. Minimum Limit of Balls in a Bag
 * https://leetcode.com/problems/minimum-limit-of-balls-in-a-bag/
 * Difficulty: Medium
 *
 * You are given an integer array nums where the ith bag contains nums[i] balls. You are also
 * given an integer maxOperations.
 *
 * You can perform the following operation at most maxOperations times:
 * - Take any bag of balls and divide it into two new bags with a positive number of balls.
 *   - For example, a bag of 5 balls can become two new bags of 1 and 4 balls, or two new bags
 *     of 2 and 3 balls.
```

```
 *
 * Your penalty is the maximum number of balls in a bag. You want to minimize your penalty
after
 * the operations.
 *
 * Return the minimum possible penalty after performing the operations.
 */

/**
 * @param {number[]} nums
 * @param {number} maxOperations
 * @return {number}
 */

      let isNice = true;
      for (const char of chars) {
        if (!substr.includes(char.toLowerCase()) || !substr.includes(char.toUpperCase())) {
          isNice = false;
          break;
        }
      }
      if (isNice) longest = substr;
    }
  }

  return longest;
};
```

1764 Form Array By Concatenating Subarrays Of Another Array

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1764. Form Array by Concatenating Subarrays of Another Array
 * https://leetcode.com/problems/form-array-by-concatenating-subarrays-of-another-array/
 * Difficulty: Medium
 *
 * You are given a 2D integer array groups of length n. You are also given an integer array
nums.
 *
 * You are asked if you can choose n disjoint subarrays from the array nums such that the ith
 * subarray is equal to groups[i] (0-indexed), and if i > 0, the (i-1)th subarray appears
before
 * the ith subarray in nums (i.e. the subarrays must be in the same order as groups).
 *
 * Return true if you can do this task, and false otherwise.
 *
 * Note that the subarrays are disjoint if and only if there is no index k such that nums[k]
 * belongs to more than one subarray. A subarray is a contiguous sequence of elements within
 * an array.
 */

/**
 * @param {number[][]} groups
 * @param {number[]} nums
 * @return {boolean}
 */
var canChoose = function(groups, nums) {
  const rows = groups.map(row => ',' + row.join(',') + ',');
  const joined = `,${nums.join(',')},`;
```

```
  for (let i = 0, offset = 0; i < rows.length; i++) {
    offset = joined.indexOf(rows[i], offset);
    if (offset === -1) {
      return false;
    }
    offset += rows[i].length - 1;
  }

  return true;
};
```

1765 Map Of Highest Peak

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1765. Map of Highest Peak
 * https://leetcode.com/problems/map-of-highest-peak/
 * Difficulty: Medium
 *
 * You are given an integer matrix isWater of size m x n that represents a map of land and
 * water cells:
 * - If isWater[i][j] == 0, cell (i, j) is a land cell.
 * - If isWater[i][j] == 1, cell (i, j) is a water cell.
 *
 * You must assign each cell a height in a way that follows these rules:
 * - The height of each cell must be non-negative.
 * - If the cell is a water cell, its height must be 0.
 * - Any two adjacent cells must have an absolute height difference of at most 1. A cell is
 * adjacent to another cell if the former is directly north, east, south, or west of the
 * latter (i.e., their sides are touching).
 *
 * Find an assignment of heights such that the maximum height in the matrix is maximized.
 *
 * Return an integer matrix height of size m x n where height[i][j] is cell (i, j)'s height.
 * If there are multiple solutions, return any of them.
 */

/**
 * @param {number[][]} isWater
 * @return {number[][]}
 */

```

1775 Equal Sum Arrays With Minimum Number Of Operations

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1775. Equal Sum Arrays With Minimum Number of Operations
 * https://leetcode.com/problems/equal-sum-arrays-with-minimum-number-of-operations/
 * Difficulty: Medium
 *
 * You are given two arrays of integers nums1 and nums2, possibly of different lengths. The
values
 * in the arrays are between 1 and 6, inclusive.
 *
 * In one operation, you can change any integer's value in any of the arrays to any value
between
 * 1 and 6, inclusive.
 *
 * Return the minimum number of operations required to make the sum of values in nums1 equal
to
 * the sum of values in nums2. Return -1 if it is not possible to make the sum of the two
arrays
 * equal.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number}
 */

1776 Car Fleet Ii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1776. Car Fleet II
 * https://leetcode.com/problems/car-fleet-ii/
 * Difficulty: Hard
 *
 * There are n cars traveling at different speeds in the same direction along a one-lane road.
 * You are given an array cars of length n, where cars[i] = [positioni, speedi] represents:
 * - positioni is the distance between the ith car and the beginning of the road in meters.
 *   It is guaranteed that positioni < positioni+1.
 * - speedi is the initial speed of the ith car in meters per second.
 *
 * For simplicity, cars can be considered as points moving along the number line. Two cars
 * collide when they occupy the same position. Once a car collides with another car, they
 * unite and form a single car fleet. The cars in the formed fleet will have the same position
 * and the same speed, which is the initial speed of the slowest car in the fleet.
 *
 * Return an array answer, where answer[i] is the time, in seconds, at which the ith car
 * collides with the next car, or -1 if the car does not collide with the next car. Answers
 * within 10-5 of the actual answers are accepted.
 */

/**
 * @param {number[][]} cars
 * @return {number[]}
 */
var getCollisionTimes = function(cars) {
  const n = cars.length;
  const stack = [];
  const collisionTimes = Array(n).fill(-1);

  for (let i = n - 1; i >= 0; i--) {
    const [pos, speed] = cars[i];

    while (stack.length > 0) {
      const j = stack[stack.length - 1];
      const [nextPos, nextSpeed] = cars[j];

      if (speed <= nextSpeed || (collisionTimes[j] > 0
          && (nextPos - pos) / (speed - nextSpeed) >= collisionTimes[j])) {
        stack.pop();
      } else {
        break;
      }
    }

    if (stack.length > 0) {
      const j = stack[stack.length - 1];
      const [nextPos, nextSpeed] = cars[j];
      collisionTimes[i] = (nextPos - pos) / (speed - nextSpeed);
    }

    stack.push(i);
  }

  return collisionTimes;
};
```

1778 Shortest Path In A Hidden Grid

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1778. Shortest Path in a Hidden Grid
 * https://leetcode.com/problems/shortest-path-in-a-hidden-grid/
 * Difficulty: Medium
 *
 * This is an interactive problem.
 *
 * There is a robot in a hidden grid, and you are trying to get it from its starting cell to
the
 * target cell in this grid. The grid is of size m x n, and each cell in the grid is either
empty
 * or blocked. It is guaranteed that the starting cell and the target cell are different, and
 * neither of them is blocked.
 *
 * You want to find the minimum distance to the target cell. However, you do not know the
grid's
 * dimensions, the starting cell, nor the target cell. You are only allowed to ask queries to
the
 * GridMaster object.
 *
 * The GridMaster class has the following functions:
 * - boolean canMove(char direction) Returns true if the robot can move in that direction.
 *   Otherwise, it returns false.
 * - void move(char direction) Moves the robot in that direction. If this move would move the
 *   robot to a blocked cell or off the grid, the move will be ignored, and the robot will
 *   remain in the same position.
 * - boolean isTarget() Returns true if the robot is currently on the target cell. Otherwise,
 *   it returns false.
 *
 * Note that direction in the above functions should be a character from {'U','D','L','R'},
 * representing the directions up, down, left, and right, respectively.
 *
 * Return the minimum distance between the robot's initial starting cell and the target cell.
 * If there is no valid path between the cells, return -1.
 *
 * Custom testing:
 *
 * The test input is read as a 2D matrix grid of size m x n where:
 * - grid[i][j] == -1 indicates that the robot is in cell (i, j) (the starting cell).
 * - grid[i][j] == 0 indicates that the cell (i, j) is blocked.
 * - grid[i][j] == 1 indicates that the cell (i, j) is empty.
 * - grid[i][j] == 2 indicates that the cell (i, j) is the target cell.
 *
 * There is exactly one -1 and 2 in grid. Remember that you will not have this information
 * in your code.
 */

/**
 * // This is the GridMaster's API interface.
 * // You should not implement it, or speculate about its implementation
 * function GridMaster() {

  const indices = [];
  for (const i in s1) {
    if (s1[i] !== s2[i] && indices.push(i) > 2) return false;
  }
```

```
  return s1[indices[0]] === s2[indices[1]] && s1[indices[1]] === s2[indices[0]];
};
```

1791 Find Center Of Star Graph

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1791. Find Center of Star Graph
 * https://leetcode.com/problems/find-center-of-star-graph/
 * Difficulty: Easy
 *
 * There is an undirected star graph consisting of n nodes labeled from 1 to n. A star graph
is a
 * graph where there is one center node and exactly n - 1 edges that connect the center node
with
 * every other node.
 *
 * You are given a 2D integer array edges where each edges[i] = [ui, vi] indicates that there
is an
 * edge between the nodes ui and vi. Return the center of the given star graph.
 */

/**
 * @param {number[][]} edges
 * @return {number}
 */
var findCenter = function(edges) {
  const set = new Set();
  for (const edge of edges) {
    for (const node of edge) {
      if (set.has(node)) {
        return node;
      }
      set.add(node);
    }
  }
};
```

1792 Maximum Average Pass Ratio

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1792. Maximum Average Pass Ratio
 * https://leetcode.com/problems/maximum-average-pass-ratio/
 * Difficulty: Medium
 *
 * There is a school that has classes of students and each class will be having a final exam.
 * You are given a 2D integer array classes, where classes[i] = [passi, totali]. You know
 * beforehand that in the ith class, there are totali total students, but only passi number
 * of students will pass the exam.
 *
 * You are also given an integer extraStudents. There are another extraStudents brilliant
 * students that are guaranteed to pass the exam of any class they are assigned to. You want
 * to assign each of the extraStudents students to a class in a way that maximizes the average
 * pass ratio across all the classes.
 *
 * The pass ratio of a class is equal to the number of students of the class that will pass
 * the exam divided by the total number of students of the class. The average pass ratio is
 * the sum of pass ratios of all the classes divided by the number of the classes.
 *
 * Return the maximum possible average pass ratio after assigning the extraStudents students.
 * Answers within 10-5 of the actual answer will be accepted.
 */
```

```
/**
* @param {number[][]} classes
* @param {number} extraStudents
* @return {number}
*/

      }
    }
  }

  return result;
};
```

1797 Design Authentication Manager

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1797. Design Authentication Manager
 * https://leetcode.com/problems/design-authentication-manager/
 * Difficulty: Medium
 *
 * There is an authentication system that works with authentication tokens. For each session,
 * the user will receive a new authentication token that will expire timeToLive seconds after
 * the currentTime. If the token is renewed, the expiry time will be extended to expire
 * timeToLive seconds after the (potentially different) currentTime.
 *
 * Implement the AuthenticationManager class:
 * - AuthenticationManager(int timeToLive) constructs the AuthenticationManager and sets the
 *   timeToLive.
 * - generate(string tokenId, int currentTime) generates a new token with the given tokenId
 *   at the given currentTime in seconds.
 * - renew(string tokenId, int currentTime) renews the unexpired token with the given tokenId
 *   at the given currentTime in seconds. If there are no unexpired tokens with the given
 *   tokenId, the request is ignored, and nothing happens.
 * - countUnexpiredTokens(int currentTime) returns the number of unexpired tokens at the
 *   given currentTime.
 *
 * Note that if a token expires at time t, and another action happens on time t (renew or
 * countUnexpiredTokens), the expiration takes place before the other actions.
 */

/**
 * @param {number} timeToLive
 */
var AuthenticationManager = function(timeToLive) {
  this.timeToLive = timeToLive;
  this.tokens = new Map();
};

/**
 * @param {string} tokenId
 * @param {number} currentTime
 * @return {void}
 */

  }
  return result;
};
```

1801 Number Of Orders In The Backlog

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1801. Number of Orders in the Backlog
 * https://leetcode.com/problems/number-of-orders-in-the-backlog/
 * Difficulty: Medium
 *
 * You are given a 2D integer array orders, where each orders[i] = [pricei, amounti,
orderTypei]
 * denotes that amounti orders have been placed of type orderTypei at the price pricei.
 * The orderTypei is:
 * - 0 if it is a batch of buy orders, or
 * - 1 if it is a batch of sell orders.
 *
 * Note that orders[i] represents a batch of amounti independent orders with the same price
and
 * order type. All orders represented by orders[i] will be placed before all orders
represented
 * by orders[i+1] for all valid i.
 *
 * There is a backlog that consists of orders that have not been executed. The backlog is
initially
 * empty. When an order is placed, the following happens:
 * - If the order is a buy order, you look at the sell order with the smallest price in the
backlog.
 *   If that sell order's price is smaller than or equal to the current buy order's price,
they will
 *   match and be executed, and that sell order will be removed from the backlog. Else, the
buy
 *   order is added to the backlog.
 * - Vice versa, if the order is a sell order, you look at the buy order with the largest
price in
 *   the backlog. If that buy order's price is larger than or equal to the current sell
order's
 *   price, they will match and be executed, and that buy order will be removed from the
backlog.
 *   Else, the sell order is added to the backlog.
 *
 * Return the total amount of orders in the backlog after placing all the orders from the
input.
 * Since this number can be large, return it modulo 109 + 7.
 */

/**
 * @param {number[][]} orders
 * @return {number}
 */
```

```

 * A trie (pronounced as "try") or prefix tree is a tree data structure used to efficiently
store
 * and retrieve keys in a dataset of strings. There are various applications of this data
structure,
 * such as autocomplete and spellchecker.
 *
 * Implement the Trie class:
 * - Trie() Initializes the trie object.
 * - void insert(String word) Inserts the string word into the trie.
 * - int countWordsEqualTo(String word) Returns the number of instances of the string word in
the
 *   trie.
 * - int countWordsStartingWith(String prefix) Returns the number of strings in the trie that
have
 *   the string prefix as a prefix.
 * - void erase(String word) Erases the string word from the trie.
 */

var Trie = function() {
  this.root = { children: {}, wordCount: 0, prefixCount: 0 };
};

/**
 * @param {string} word
 * @return {void}
 */

```

1805 Number Of Different Integers In A String

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1805. Number of Different Integers in a String
 * https://leetcode.com/problems/number-of-different-integers-in-a-string/
 * Difficulty: Easy
 *
 * You are given a string word that consists of digits and lowercase English letters.
 *
 * You will replace every non-digit character with a space. For example, "a123bc34d8ef34"
 * will become " 123  34 8  34". Notice that you are left with some integers that are
 * separated by at least one space: "123", "34", "8", and "34".
 *
 * Return the number of different integers after performing the replacement operations on
word.
 *
 * Two integers are considered different if their decimal representations without any leading
 * zeros are different.
 */

/**
```

```
 * @param {string} word
 * @return {number}
 */
var numDifferentIntegers = function(word) {
  const uniqueIntegers = new Set();
  let currentNum = '';

  for (const char of word) {
    if (/\d/.test(char)) {
      currentNum += char;
    } else if (currentNum) {
      uniqueIntegers.add(String(BigInt(currentNum)));
      currentNum = '';
    }
  }

  if (currentNum) {
    uniqueIntegers.add(String(BigInt(currentNum)));
  }

  return uniqueIntegers.size;
};
```

1806 Minimum Number Of Operations To Reinitialize A Permutation

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1806. Minimum Number of Operations to Reinitialize a Permutation
 * https://leetcode.com/problems/minimum-number-of-operations-to-reinitialize-a-permutation/
 * Difficulty: Medium
 *
 * You are given an even integer n. You initially have a permutation perm of size n where
 * perm[i] == i (0-indexed).
 *
 * In one operation, you will create a new array arr, and for each i:
 * - If i % 2 == 0, then arr[i] = perm[i / 2].
 * - If i % 2 == 1, then arr[i] = perm[n / 2 + (i - 1) / 2].
 *
 * You will then assign arr to perm.
 *
 * Return the minimum non-zero number of operations you need to perform on perm to return the
 * permutation to its initial value.
 */

/**
 * @param {number} n
 * @return {number}
 */
var reinitializePermutation = function(n) {
  let currentIndex = 1;
  let result = 0;

  do {
    if (currentIndex % 2 === 0) {
      currentIndex = currentIndex / 2;
    } else {
      currentIndex = n / 2 + (currentIndex - 1) / 2;
    }
    result++;
  } while (currentIndex !== 1);

  return result;
};
```

1807 Evaluate The Bracket Pairs Of A String

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1807. Evaluate the Bracket Pairs of a String
 * https://leetcode.com/problems/evaluate-the-bracket-pairs-of-a-string/
 * Difficulty: Medium
 *
 * You are given a string s that contains some bracket pairs, with each pair containing
 * a non-empty key.
 *
 * - For example, in the string "(name)is(age)yearsold", there are two bracket pairs that
contain
 *   the keys "name" and "age".
 *
 * You know the values of a wide range of keys. This is represented by a 2D string array
knowledge
 * where each knowledge[i] = [keyi, valuei] indicates that key keyi has a value of valuei.
 *
 * You are tasked to evaluate all of the bracket pairs. When you evaluate a bracket pair that
 * contains some key keyi, you will:
 * - Replace keyi and the bracket pair with the key's corresponding valuei.
 * - If you do not know the value of the key, you will replace keyi and the bracket pair with
a
 *   question mark "?" (without the quotation marks).
 *
 * Each key will appear at most once in your knowledge. There will not be any nested brackets
in s.
 *
 * Return the resulting string after evaluating all of the bracket pairs.
 */

/**
 * @param {string} s
 * @param {string[][]} knowledge
 * @return {string}
 */
var evaluate = function(s, knowledge) {
  const keyValueMap = new Map(knowledge);
  let result = '';
  let i = 0;

  while (i < s.length) {
    if (s[i] === '(') {
      i++;
      let key = '';
      while (i < s.length && s[i] !== ')') {
        key += s[i++];
      }
      result += keyValueMap.get(key) || '?';
      i++;
    } else {
      result += s[i++];
    }
  }

  return result;
};
```

1808 Maximize Number Of Nice Divisors

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
```

```
 * 1808. Maximize Number of Nice Divisors
 * https://leetcode.com/problems/maximize-number-of-nice-divisors/
 * Difficulty: Hard
 *
 * You are given a positive integer primeFactors. You are asked to construct a positive
 * integer n that satisfies the following conditions:
 * - The number of prime factors of n (not necessarily distinct) is at most primeFactors.
 * - The number of nice divisors of n is maximized. Note that a divisor of n is nice if it
 *   is divisible by every prime factor of n. For example, if n = 12, then its prime factors
 *   are [2,2,3], then 6 and 12 are nice divisors, while 3 and 4 are not.
 *
 * Return the number of nice divisors of n. Since that number can be too large, return it
 * modulo 109 + 7.
 *
 * Note that a prime number is a natural number greater than 1 that is not a product of two
 * smaller natural numbers. The prime factors of a number n is a list of prime numbers such
 * that their product equals n.
 */

/**
 * @param {number} primeFactors
 * @return {number}
 */
var maxNiceDivisors = function(primeFactors) {
  const MOD = 1e9 + 7;

  if (primeFactors <= 3) return primeFactors;

  const quotient = Math.floor(primeFactors / 3);
  const remainder = primeFactors % 3;

  if (remainder === 0) return power(3, quotient);
  if (remainder === 1) return (power(3, quotient - 1) * 4) % MOD;

  return (power(3, quotient) * 2) % MOD;

  function power(base, exponent) {
    let result = BigInt(1);
    base = BigInt(base);
    while (exponent > 0) {
      if (exponent & 1) result = (result * base) % BigInt(MOD);
      base = (base * base) % BigInt(MOD);
      exponent >>= 1;
    }
    return Number(result);
  }
};
```

1810 Minimum Path Cost In A Hidden Grid

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1810. Minimum Path Cost in a Hidden Grid
 * https://leetcode.com/problems/minimum-path-cost-in-a-hidden-grid/
 * Difficulty: Medium
 *
 * This is an interactive problem.
 *
 * There is a robot in a hidden grid, and you are trying to get it from its starting cell to
the
 * target cell in this grid. The grid is of size m x n, and each cell in the grid is either
empty
 * or blocked. It is guaranteed that the starting cell and the target cell are different, and
 * neither of them is blocked.
 *
 * Each cell has a cost that you need to pay each time you move to the cell. The starting
cell's
 * cost is not applied before the robot moves.
 *
```

```
 * You want to find the minimum total cost to move the robot to the target cell. However, you
do
 * not know the grid's dimensions, the starting cell, nor the target cell. You are only
allowed
 * to ask queries to the GridMaster object.
 *
 * The GridMaster class has the following functions:
 * - boolean canMove(char direction) Returns true if the robot can move in that direction.
 *   Otherwise, it returns false.
 * - int move(char direction) Moves the robot in that direction and returns the cost of moving
 *   to that cell. If this move would move the robot to a blocked cell or off the grid, the
move
 *   will be ignored, the robot will remain in the same position, and the function will return
 -1.
 * - boolean isTarget() Returns true if the robot is currently on the target cell. Otherwise,
it
 *   returns false.
 *
 * Note that direction in the above functions should be a character from {'U','D','L','R'},
 * representing the directions up, down, left, and right, respectively.
 *
 * Return the minimum total cost to get the robot from its initial starting cell to the target
 * cell. If there is no valid path between the cells, return -1.
 *
 * Custom testing:
 *
 * The test input is read as a 2D matrix grid of size m x n and four integers r1, c1, r2, and
 * c2 where:
 * - grid[i][j] == 0 indicates that the cell (i, j) is blocked.
 * - grid[i][j] >= 1 indicates that the cell (i, j) is empty and grid[i][j] is the cost to
move
 *   to that cell.
 * - (r1, c1) is the starting cell of the robot.
 * - (r2, c2) is the target cell of the robot.
 *
 * Remember that you will not have this information in your code.
 */

/**
 * // This is the GridMaster's API interface.
 * // You should not implement it, or speculate about its implementation
 * function GridMaster() {
 *
 *     @param {character} direction
 *     @return {boolean}
 *     this.canMove = function(direction) {
 *         ...
 *     };

        }
      }
    }
  }
};
```

1812 Determine Color Of A Chessboard Square

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1812. Determine Color of a Chessboard Square
```

```
 * https://leetcode.com/problems/determine-color-of-a-chessboard-square/
 * Difficulty: Easy
 *
 * You are given coordinates, a string that represents the coordinates of a square of
 * the chessboard. Below is a chessboard for your reference.
 *
 * Return true if the square is white, and false if the square is black.
 *
 * The coordinate will always represent a valid chessboard square. The coordinate will
 * always have the letter first, and the number second.
 */

/**
 * @param {string} coordinates
 * @return {boolean}
 */
var squareIsWhite = function(coordinates) {
  const [x, y] = coordinates;
  return (x.charCodeAt() + +y) % 2 !== 0;
};
```

1813 Sentence Similarity Iii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1813. Sentence Similarity III
 * https://leetcode.com/problems/sentence-similarity-iii/
 * Difficulty: Medium
 *
 * You are given two strings sentence1 and sentence2, each representing a sentence composed of
 * words. A sentence is a list of words that are separated by a single space with no leading
 * or trailing spaces. Each word consists of only uppercase and lowercase English characters.
 *
 * Two sentences s1 and s2 are considered similar if it is possible to insert an arbitrary
 * sentence (possibly empty) inside one of these sentences such that the two sentences become
 * equal. Note that the inserted sentence must be separated from existing words by spaces.
 *
 * For example:
 * - s1 = "Hello Jane" and s2 = "Hello my name is Jane" can be made equal by inserting "my
name is"
 *   between "Hello" and "Jane" in s1.
 * - s1 = "Frog cool" and s2 = "Frogs are cool" are not similar, since although there is a
sentence
 *   "s are" inserted into s1, it is not separated from "Frog" by a space.
 *
 * Given two sentences sentence1 and sentence2, return true if sentence1 and sentence2 are
 * similar. Otherwise, return false.
 */

/**
 * @param {string} sentence1
 * @param {string} sentence2
 * @return {boolean}
 */
var areSentencesSimilar = function(sentence1, sentence2) {
  let words1 = sentence1.split(' ');

 * @param {number[]} nums
 * @return {number}
 */
var countNicePairs = function(nums) {
  const MOD = 1e9 + 7;
  const map = new Map();
  let result = 0;

  for (const num of nums) {
    const diff = num - reverseNumber(num);
    const count = map.get(diff) || 0;
    result = (result + count) % MOD;
    map.set(diff, count + 1);
  }

  return result;

  function reverseNumber(num) {
    return Number(String(num).split('').reverse().join(''));
  }
};
```

1815 Maximum Number Of Groups Getting Fresh Donuts

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1815. Maximum Number of Groups Getting Fresh Donuts
 * https://leetcode.com/problems/maximum-number-of-groups-getting-fresh-donuts/
 * Difficulty: Hard
 *
 * There is a donuts shop that bakes donuts in batches of batchSize. They have a rule where
they
 * must serve all of the donuts of a batch before serving any donuts of the next batch. You
are
 * given an integer batchSize and an integer array groups, where groups[i] denotes that there
is
 * a group of groups[i] customers that will visit the shop. Each customer will get exactly one
 * donut.
```

```
 *
 * When a group visits the shop, all customers of the group must be served before serving any
 * of the following groups. A group will be happy if they all get fresh donuts. That is, the
 * first customer of the group does not receive a donut that was left over from the previous
group.
 *
 * You can freely rearrange the ordering of the groups. Return the maximum possible number of
 * happy groups after rearranging the groups.
 */

/**

    for (let i = 1; i < batchSize; i++) {
      if (remainders[i] === 0) continue;
      remainders[i]--;

      let current = 0;
      if (leftover === 0) current = 1;
      maxHappy = Math.max(
        maxHappy, current + findMaxHappy(remainders, (leftover + i) % batchSize, memo)
      );

      remainders[i]++;
    }

    memo.set(key, maxHappy);
    return maxHappy;
  }
};
```

1816 Truncate Sentence

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1816. Truncate Sentence
 * https://leetcode.com/problems/truncate-sentence/
 * Difficulty: Easy
 *
 * A sentence is a list of words that are separated by a single space with no leading or
 * trailing spaces. Each of the words consists of only uppercase and lowercase English
 * letters (no punctuation).
 * - For example, "Hello World", "HELLO", and "hello world hello world" are all sentences.
 *
 * You are given a sentence s and an integer k. You want to truncate s such that it contains
 * only the first k words. Return s after truncating it.
 */

/**
```

```
 * @param {string} s
 * @param {number} k
 * @return {string}
 */
var truncateSentence = function(s, k) {
  return s.split(' ').slice(0, k).join(' ');
};
```

1817 Finding The Users Active Minutes

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 1817. Finding the Users Active Minutes
 * https://leetcode.com/problems/finding-the-users-active-minutes/
 * Difficulty: Medium
 *
 * You are given the logs for users' actions on LeetCode, and an integer k. The logs are
represented
 * by a 2D integer array logs where each logs[i] = [IDi, timei] indicates that the user with
IDi
 * performed an action at the minute timei.
 *
 * Multiple users can perform actions simultaneously, and a single user can perform multiple
actions
 * in the same minute.
 *
 * The user active minutes (UAM) for a given user is defined as the number of unique minutes
in which
 * the user performed an action on LeetCode. A minute can only be counted once, even if
multiple actions
 * occur during it.
 *
 * You are to calculate a 1-indexed array answer of size k such that, for each j (1 <= j <=
k), answer[j]
 * is the number of users whose UAM equals j.
 *
 * Return the array answer as described above.
 */

/**
 * @param {number[][]} logs
 * @param {number} k
 * @return {number[]}
 */

1819 Number Of Different Subsequences Gcds

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1819. Number of Different Subsequences GCDs
 * https://leetcode.com/problems/number-of-different-subsequences-gcds/
 * Difficulty: Hard
 *
 * You are given an array nums that consists of positive integers.
 *
 * The GCD of a sequence of numbers is defined as the greatest integer that divides all the
 * numbers in the sequence evenly.
 * - For example, the GCD of the sequence [4,6,16] is 2.
 *
 * A subsequence of an array is a sequence that can be formed by removing some elements
(possibly
 * none) of the array.
 * - For example, [2,5,10] is a subsequence of [1,2,1,2,4,1,5,10].
 *
```

```
 * Return the number of different GCDs among all non-empty subsequences of nums.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var countDifferentSubsequenceGCDs = function(nums) {
  const maxNum = Math.max(...nums);
  const exists = new Array(maxNum + 1).fill(false);
  let result = 0;

  }

  return negativeCount % 2 === 0 ? 1 : -1;
};
```

1823 Find The Winner Of The Circular Game

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1823. Find the Winner of the Circular Game
 * https://leetcode.com/problems/find-the-winner-of-the-circular-game/
 * Difficulty: Medium
 *
 * There are n friends that are playing a game. The friends are sitting in a circle and are
 * numbered from 1 to n in clockwise order. More formally, moving clockwise from the ith
```

```
 * friend brings you to the (i+1)th friend for 1 <= i < n, and moving clockwise from the
 * nth friend brings you to the 1st friend.
 *
 * The rules of the game are as follows:
 * 1. Start at the 1st friend.
 * 2. Count the next k friends in the clockwise direction including the friend you started at.
 *    The counting wraps around the circle and may count some friends more than once.
 * 3. The last friend you counted leaves the circle and loses the game.
 * 4. If there is still more than one friend in the circle, go back to step 2 starting from
the
 *    friend immediately clockwise of the friend who just lost and repeat.
 * 5. Else, the last friend in the circle wins the game.
 *
 * Given the number of friends, n, and an integer k, return the winner of the game.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {number}
 */
var findTheWinner = function(n, k) {
  let winner = 0;

  for (let i = 1; i <= n; i++) {
    winner = (winner + k) % i;
  }

  return winner + 1;
};
```

1824 Minimum Sideway Jumps

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1824. Minimum Sideway Jumps
 * https://leetcode.com/problems/minimum-sideway-jumps/
 * Difficulty: Medium
 *
 * There is a 3 lane road of length n that consists of n + 1 points labeled from 0 to n. A
frog
 * starts at point 0 in the second lane and wants to jump to point n. However, there could be
 * obstacles along the way.
 *
 * You are given an array obstacles of length n + 1 where each obstacles[i] (ranging from 0 to
 3)
 * describes an obstacle on the lane obstacles[i] at point i. If obstacles[i] == 0, there are
no
 * obstacles at point i. There will be at most one obstacle in the 3 lanes at each point.
 * - For example, if obstacles[2] == 1, then there is an obstacle on lane 1 at point 2.
 *
 * The frog can only travel from point i to point i + 1 on the same lane if there is not an
obstacle
 * on the lane at point i + 1. To avoid obstacles, the frog can also perform a side jump to
jump
 * to another lane (even if they are not adjacent) at the same point if there is no obstacle
on
 * the new lane.
 * - For example, the frog can jump from lane 3 at point 3 to lane 1 at point 3.
 *
 * Return the minimum number of side jumps the frog needs to reach any lane at point n
starting
 * from lane 2 at point 0.
 *
 * Note: There will be no obstacles on points 0 and n.
 */

/**
 * @param {number[]} obstacles
```

```
 * @return {number}
 */
var minSideJumps = function(obstacles) {
  const n = obstacles.length;
  let dp = [1, 0, 1];

  for (let i = 1; i < n; i++) {
    const currentObstacle = obstacles[i];
    const nextDp = [Infinity, Infinity, Infinity];

    for (let lane = 1; lane <= 3; lane++) {

      nextDp[lane - 1] = dp[lane - 1];

      for (let fromLane = 1; fromLane <= 3; fromLane++) {
        if (fromLane !== lane && fromLane !== currentObstacle) {
          nextDp[lane - 1] = Math.min(nextDp[lane - 1], dp[fromLane - 1] + 1);
        }
      }
    }

    dp = nextDp;
  }

  return Math.min(...dp);
};
```

1825 Finding Mk Average

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1825. Finding MK Average
 * https://leetcode.com/problems/finding-mk-average/
 * Difficulty: Hard
 *
 * You are given two integers, m and k, and a stream of integers. You are tasked to implement
a data
 * structure that calculates the MKAverage for the stream.
 *
 * The MKAverage can be calculated using these steps:
 * - If the number of the elements in the stream is less than m you should consider the
MKAverage to
 *   be -1. Otherwise, copy the last m elements of the stream to a separate container.
 * - Remove the smallest k elements and the largest k elements from the container.
 * - Calculate the average value for the rest of the elements rounded down to the nearest
integer.
 *
 * Implement the MKAverage class:
 * - MKAverage(int m, int k) Initializes the MKAverage object with an empty stream and the two
 *   integers m and k.
 * - void addElement(int num) Inserts a new element num into the stream.
 * - int calculateMKAverage() Calculates and returns the MKAverage for the current stream
rounded
 *   down to the nearest integer.
 */

1826 Faulty Sensor

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1826. Faulty Sensor
 * https://leetcode.com/problems/faulty-sensor/
 * Difficulty: Easy
 *
 * An experiment is being conducted in a lab. To ensure accuracy, there are two sensors
```

```
 * collecting data simultaneously. You are given two arrays sensor1 and sensor2, where
 * sensor1[i] and sensor2[i] are the ith data points collected by the two sensors.
 *
 * However, this type of sensor has a chance of being defective, which causes exactly one data
 * point to be dropped. After the data is dropped, all the data points to the right of the
 * dropped data are shifted one place to the left, and the last data point is replaced with
 * some random value. It is guaranteed that this random value will not be equal to the dropped
 * value.
 * - For example, if the correct data is [1,2,3,4,5] and 3 is dropped, the sensor could
 *   return [1,2,4,5,7] (the last position can be any value, not just 7).
 *
 * We know that there is a defect in at most one of the sensors. Return the sensor number
 * (1 or 2) with the defect. If there is no defect in either sensor or if it is impossible
 * to determine the defective sensor, return -1.
 */

/**
 * @param {number[]} sensor1

 * 1835. Find XOR Sum of All Pairs Bitwise AND
 * https://leetcode.com/problems/find-xor-sum-of-all-pairs-bitwise-and/
 * Difficulty: Hard
 *
 * The XOR sum of a list is the bitwise XOR of all its elements. If the list only contains one
 * element, then its XOR sum will be equal to this element.
 * - For example, the XOR sum of [1,2,3,4] is equal to 1 XOR 2 XOR 3 XOR 4 = 4, and the XOR
 *   sum of [3] is equal to 3.
 *
 * You are given two 0-indexed arrays arr1 and arr2 that consist only of non-negative
integers.
 *
 * Consider the list containing the result of arr1[i] AND arr2[j] (bitwise AND) for every (i,
j)
 * pair where 0 <= i < arr1.length and 0 <= j < arr2.length.
 *
 * Return the XOR sum of the aforementioned list.
```

```
 */

/**
 * @param {number[]} arr1
 * @param {number[]} arr2
 * @return {number}
 */
var getXORSum = function(arr1, arr2) {
  let xor1 = 0;
  let xor2 = 0;

  for (const num of arr1) {
    xor1 ^= num;
  }

  for (const num of arr2) {
    xor2 ^= num;
  }

  return xor1 & xor2;
};
```

1836 Remove Duplicates From An Unsorted Linked List

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1836. Remove Duplicates From an Unsorted Linked List
 * https://leetcode.com/problems/remove-duplicates-from-an-unsorted-linked-list/
 * Difficulty: Medium
 *
 * Given the head of a linked list, find all the values that appear more than once in the list
 * and delete the nodes that have any of those values.
 *
 * Return the linked list after the deletions.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {ListNode}
 */
var deleteDuplicatesUnsorted = function(head) {

    }
    current = current.next;
  }
```

```
  return dummy.next;
};
```

1837 Sum Of Digits In Base K

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1837. Sum of Digits in Base K
 * https://leetcode.com/problems/sum-of-digits-in-base-k/
 * Difficulty: Easy
 *
 * Given an integer n (in base 10) and a base k, return the sum of the digits of n after
 * converting n from base 10 to base k.
 *
 * After converting, each digit should be interpreted as a base 10 number, and the sum should
 * be returned in base 10.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {number}
 */
var sumBase = function(n, k) {
  let digitSum = 0;

  while (n > 0) {
    digitSum += n % k;
    n = Math.floor(n / k);
  }

  return digitSum;
};
```

1838 Frequency Of The Most Frequent Element

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1838. Frequency of the Most Frequent Element
 * https://leetcode.com/problems/frequency-of-the-most-frequent-element/
 * Difficulty: Medium
 *
 * The frequency of an element is the number of times it occurs in an array.
 *
 * You are given an integer array nums and an integer k. In one operation, you can choose
 * an index of nums and increment the element at that index by 1.
 *
 * Return the maximum possible frequency of an element after performing at most k operations.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var maxFrequency = function(nums, k) {
  nums.sort((a, b) => a - b);

  let result = 0;
  let currentSum = 0;
  let left = 0;
```

```
  for (let right = 0; right < nums.length; right++) {
    currentSum += nums[right];
    while (currentSum + k < nums[right] * (right - left + 1)) {
      currentSum -= nums[left];
      left++;
    }
    result = Math.max(result, right - left + 1);
  }

  return result;
};
```

1839 Longest Substring Of All Vowels In Order

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1839. Longest Substring Of All Vowels in Order
 * https://leetcode.com/problems/longest-substring-of-all-vowels-in-order/
 * Difficulty: Medium
 *
 * A string is considered beautiful if it satisfies the following conditions:
 * - Each of the 5 English vowels ('a', 'e', 'i', 'o', 'u') must appear at least once in it.
 * - The letters must be sorted in alphabetical order (i.e. all 'a's before 'e's, all 'e's
 *   before 'i's, etc.).
 *
 * For example, strings "aeiou" and "aaaaaaeiiiioou" are considered beautiful, but "uaeio",
"aeoiu",
 * and "aaaeeeooo" are not beautiful.
 *
 * Given a string word consisting of English vowels, return the length of the longest
beautiful
 * substring of word. If no such substring exists, return 0.
 *
 * A substring is a contiguous sequence of characters in a string.
 */

/**
 * @param {string} word
 * @return {number}
 */

      start = i;
      vowelCount = 1;
    } else if (word[i] > word[i - 1]) {
      vowelCount++;
    }

    if (vowelCount === 5) {
      result = Math.max(result, i - start + 1);
    }
  }

  return result;
};
```

1840 Maximum Building Height

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1840. Maximum Building Height
 * https://leetcode.com/problems/maximum-building-height/
 * Difficulty: Hard
 *
 * You want to build n new buildings in a city. The new buildings will be built in a line
 * and are labeled from 1 to n.
 *
 * However, there are city restrictions on the heights of the new buildings:
 * - The height of each building must be a non-negative integer.
 * - The height of the first building must be 0.
 * - The height difference between any two adjacent buildings cannot exceed 1.
 *
 * Additionally, there are city restrictions on the maximum height of specific buildings.
 * These restrictions are given as a 2D integer array restrictions where
 * restrictions[i] = [idi, maxHeighti] indicates that building idi must have a height
 * less than or equal to maxHeighti.
 *
 * It is guaranteed that each building will appear at most once in restrictions, and building
 * 1 will not be in restrictions.
 *
 * Return the maximum possible height of the tallest building.
 */

/**
 * @param {number} n
 * @param {number[][]} restrictions
 * @return {number}
 */

    }

    return true;
  }
};
```

1844 Replace All Digits With Characters

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1844. Replace All Digits with Characters
 * https://leetcode.com/problems/replace-all-digits-with-characters/
 * Difficulty: Easy
 *
```

```
 * You are given a 0-indexed string s that has lowercase English letters in its even indices
and
 * digits in its odd indices.
 *
 * You must perform an operation shift(c, x), where c is a character and x is a digit, that
returns
 * the xth character after c.
 * - For example, shift('a', 5) = 'f' and shift('x', 0) = 'x'.
 *
 * For every odd index i, you want to replace the digit s[i] with the result of the
 * shift(s[i-1], s[i]) operation.
 *
 * Return s after replacing all digits. It is guaranteed that shift(s[i-1], s[i]) will never
 * exceed 'z'.
 *
 * Note that shift(c, x) is not a preloaded function, but an operation to be implemented as
part
 * of the solution.
 */

/**
 * @param {string} s
 * @return {string}
 */

  const result = s.split('');

  for (let i = 1; i < s.length; i += 2) {
    result[i] = shiftChar(s[i - 1], s[i]);
  }

  return result.join('');

  function shiftChar(char, shift) {
    return String.fromCharCode(char.charCodeAt(0) + parseInt(shift));
  }
};
```

1845 Seat Reservation Manager

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 1845. Seat Reservation Manager
 * https://leetcode.com/problems/seat-reservation-manager/
 * Difficulty: Medium
 *
 * Design a system that manages the reservation state of n seats that are numbered from 1 to
n.
 *
 * Implement the SeatManager class:
 * - SeatManager(int n) Initializes a SeatManager object that will manage n seats numbered
from
 *   1 to n. All seats are initially available.
 * - int reserve() Fetches the smallest-numbered unreserved seat, reserves it, and returns its
 *   number.
 * - void unreserve(int seatNumber) Unreserves the seat with the given seatNumber.
 */

/**
 * @param {number} n
 */
var SeatManager = function(n) {
  this.nextAvailable = 1;
  this.unreservedSeats = new Set();
};

/**
 * @return {number}
 */
```

```
SeatManager.prototype.reserve = function() {
  if (this.unreservedSeats.size > 0) {
    const minSeat = Math.min(...this.unreservedSeats);
    if (minSeat < this.nextAvailable) {
      this.unreservedSeats.delete(minSeat);
      return minSeat;
    }
  }
  return this.nextAvailable++;
};

/**
 * @param {number} seatNumber
 * @return {void}
 */
SeatManager.prototype.unreserve = function(seatNumber) {
  this.unreservedSeats.add(seatNumber);
};
```

1846 Maximum Element After Decreasing And Rearranging

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1846. Maximum Element After Decreasing and Rearranging
 * https://leetcode.com/problems/maximum-element-after-decreasing-and-rearranging/
 * Difficulty: Medium
 *
 * You are given an array of positive integers arr. Perform some operations (possibly none) on
 * arr so that it satisfies these conditions:
 * - The value of the first element in arr must be 1.
 * - The absolute difference between any 2 adjacent elements must be less than or equal to 1.
 *   In other words, abs(arr[i] - arr[i - 1]) <= 1 for each i where 1 <= i < arr.length
 *   (0-indexed). abs(x) is the absolute value of x.
 *
 * There are 2 types of operations that you can perform any number of times:
 * - Decrease the value of any element of arr to a smaller positive integer.
 * - Rearrange the elements of arr to be in any order.
 *
 * Return the maximum possible value of an element in arr after performing the operations to
 * satisfy the conditions.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */

    }
  }

  return result;
};
```

1849 Splitting A String Into Descending Consecutive Values

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1849. Splitting a String Into Descending Consecutive Values
 * https://leetcode.com/problems/splitting-a-string-into-descending-consecutive-values/
 * Difficulty: Medium
 *
 * You are given a string s that consists of only digits.
 *
 * Check if we can split s into two or more non-empty substrings such that the numerical
values of
 * the substrings are in descending order and the difference between numerical values of every
 two
 * adjacent substrings is equal to 1.
 * - For example, the string s = "0090089" can be split into ["0090", "089"] with numerical
```

```
values
 *   [90,89]. The values are in descending order and adjacent values differ by 1, so this way
is
 *   valid.
 * - Another example, the string s = "001" can be split into ["0", "01"], ["00", "1"], or
 *   ["0", "0", "1"]. However all the ways are invalid because they have numerical values
 *   [0,1], [0,1], and [0,0,1] respectively, all of which are not in descending order.
 *
 * Return true if it is possible to split s as described above, or false otherwise.
 *
 * A substring is a contiguous sequence of characters in a string.
 */

/**
 * @param {string} s
 * @return {boolean}
 */
var splitString = function(s) {
  let firstValue = 0;
  for (let i = 0; i < s.length - 1; i++) {

      }
      dp[sticks][visible] = (dp[sticks][visible] + dp[sticks - 1][visible] * (sticks - 1)) %
modulo;
    }
  }

  return dp[n][k];
};
```

1868 Product Of Two Run Length Encoded Arrays

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1868. Product of Two Run-Length Encoded Arrays
 * https://leetcode.com/problems/product-of-two-run-length-encoded-arrays/
 * Difficulty: Medium
 *
 * Run-length encoding is a compression algorithm that allows for an integer array nums with
```

```
 * many segments of consecutive repeated numbers to be represented by a (generally smaller)
 * 2D array encoded. Each encoded[i] = [vali, freqi] describes the ith segment of repeated
 * numbers in nums where vali is the value that is repeated freqi times.
 * - For example, nums = [1,1,1,2,2,2,2,2] is represented by the run-length encoded array
 *   encoded = [[1,3],[2,5]]. Another way to read this is "three 1's followed by five 2's".
 *
 * The product of two run-length encoded arrays encoded1 and encoded2 can be calculated using
 * the following steps:
 * 1. Expand both encoded1 and encoded2 into the full arrays nums1 and nums2 respectively.
 * 2. Create a new array prodNums of length nums1.length and set prodNums[i] = nums1[i] *
nums2[i].
 * 3. Compress prodNums into a run-length encoded array and return it.
 *
 * You are given two run-length encoded arrays encoded1 and encoded2 representing full arrays
 * nums1 and nums2 respectively. Both nums1 and nums2 have the same length. Each
 * encoded1[i] = [vali, freqi] describes the ith segment of nums1, and each
 * encoded2[j] = [valj, freqj] describes the jth segment of nums2.
 *
 * Return the product of encoded1 and encoded2.
 *
 * Note: Compression should be done such that the run-length encoded array has the minimum
 * possible length.
 */

1869 Longer Contiguous Segments Of Ones Than Zeros

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1869. Longer Contiguous Segments of Ones than Zeros
 * https://leetcode.com/problems/longer-contiguous-segments-of-ones-than-zeros/
 * Difficulty: Easy
```

```
 *
 * Given a binary string s, return true if the longest contiguous segment of 1's is strictly
 * longer than the longest contiguous segment of 0's in s, or return false otherwise.
 * - For example, in s = "110100010" the longest continuous segment of 1s has length 2, and
the
 *   longest continuous segment of 0s has length 3.
 *
 * Note that if there are no 0's, then the longest continuous segment of 0's is considered to
 * have a length 0. The same applies if there is no 1's.
 */

/**
 * @param {string} s
 * @return {boolean}
 */
var checkZeroOnes = function(s) {
  let maxOnes = 0;
  let maxZeros = 0;

      currentOnes = 0;
      maxZeros = Math.max(maxZeros, currentZeros);
    }
  }

  return maxOnes > maxZeros;
};
```

1870 Minimum Speed To Arrive On Time

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1870. Minimum Speed to Arrive on Time
 * https://leetcode.com/problems/minimum-speed-to-arrive-on-time/
 * Difficulty: Medium
 *
 * You are given a floating-point number hour, representing the amount of time you have to
reach
 * the office. To commute to the office, you must take n trains in sequential order. You are
also
 * given an integer array dist of length n, where dist[i] describes the distance (in
kilometers)
 * of the ith train ride.
 *
 * Each train can only depart at an integer hour, so you may need to wait in between each
train
 * ride.
 * - For example, if the 1st train ride takes 1.5 hours, you must wait for an additional 0.5
hours
 *   before you can depart on the 2nd train ride at the 2 hour mark.
 *
 * Return the minimum positive integer speed (in kilometers per hour) that all the trains must
 * travel at for you to reach the office on time, or -1 if it is impossible to be on time.
 *
 * Tests are generated such that the answer will not exceed 107 and hour will have at most two
 * digits after the decimal point.
 */

/**
 * @param {number[]} dist
 * @param {number} hour
```

```
 * @return {number}
 */

```

1872 Stone Game Viii

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1872. Stone Game VIII
 * https://leetcode.com/problems/stone-game-viii/
 * Difficulty: Hard
 *
 * Alice and Bob take turns playing a game, with Alice starting first.
 *
 * There are n stones arranged in a row. On each player's turn, while the number of stones is
more
 * than one, they will do the following:
 * 1. Choose an integer x > 1, and remove the leftmost x stones from the row.
 * 2. Add the sum of the removed stones' values to the player's score.
 * 3. Place a new stone, whose value is equal to that sum, on the left side of the row.
 *
 * The game stops when only one stone is left in the row.
 *
 * The score difference between Alice and Bob is (Alice's score - Bob's score). Alice's goal
is to
 * maximize the score difference, and Bob's goal is the minimize the score difference.
 *
 * Given an integer array stones of length n where stones[i] represents the value of the ith
stone
 * from the left, return the score difference between Alice and Bob if they both play
optimally.
 */

/**
 * @param {number[]} stones
 * @return {number}
 */

    left++;
    right--;
  }

  return result;
};
```

1878 Get Biggest Three Rhombus Sums In A Grid

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1878. Get Biggest Three Rhombus Sums in a Grid
 * https://leetcode.com/problems/get-biggest-three-rhombus-sums-in-a-grid/
 * Difficulty: Medium
 *
 * You are given an m x n integer matrix grid.
 *
 * A rhombus sum is the sum of the elements that form the border of a regular rhombus shape in
 * grid. The rhombus must have the shape of a square rotated 45 degrees with each of the
corners
 * centered in a grid cell. Below is an image of four valid rhombus shapes with the
corresponding
 * colored cells that should be included in each rhombus sum.
 *
 * Note that the rhombus can have an area of 0, which is depicted by the purple rhombus in the
 * bottom right corner.
 *
```

```
 * Return the biggest three distinct rhombus sums in the grid in descending order. If there
are
 * less than three distinct values, return all of them.
 */

/**
 * @param {number[][]} grid
 * @return {number[]}
 */

      }
    }
  }

  return dp[(1 << n) - 1];
};
```

1880 Check If Word Equals Summation Of Two Words

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1880. Check if Word Equals Summation of Two Words
 * https://leetcode.com/problems/check-if-word-equals-summation-of-two-words/
 * Difficulty: Easy
 *
 * The letter value of a letter is its position in the alphabet starting from
 * 0 (i.e. 'a' -> 0, 'b' -> 1, 'c' -> 2, etc.).
 *
 * The numerical value of some string of lowercase English letters s is the
 * concatenation of the letter values of each letter in s, which is then
 * converted into an integer.
 *
 * For example, if s = "acb", we concatenate each letter's letter value,
 * resulting in "021". After converting it, we get 21.
 *
 * You are given three strings firstWord, secondWord, and targetWord, each
 * consisting of lowercase English letters 'a' through 'j' inclusive.
 *
 * Return true if the summation of the numerical values of firstWord and
 * secondWord equals the numerical value of targetWord, or false otherwise.
 */

/**
 * @param {string} firstWord
 * @param {string} secondWord
 * @param {string} targetWord
 * @return {boolean}
 */
var isSumEqual = function(firstWord, secondWord, targetWord) {
  const [a, b, c] = [firstWord, secondWord, targetWord]
    .map(str => +str.split('').map(v => v.charCodeAt() - 97).join(''));

  return a + b === c;
};
```

1881 Maximum Value After Insertion

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1881. Maximum Value after Insertion
 * https://leetcode.com/problems/maximum-value-after-insertion/
 * Difficulty: Medium
 *
 * You are given a very large integer n, represented as a string, and an integer digit x.
 * The digits in n and the digit x are in the inclusive range [1, 9], and n may represent
 * a negative number.
 *
 * You want to maximize n's numerical value by inserting x anywhere in the decimal
representation
 * of n. You cannot insert x to the left of the negative sign.
```

```
 * - For example, if n = 73 and x = 6, it would be best to insert it between 7 and 3, making
 *   n = 763.
 * - If n = -55 and x = 2, it would be best to insert it before the first 5, making n = -255.
 *
 * Return a string representing the maximum value of n after the insertion.
 */

/**
 * @param {string} n
 * @param {number} x
 * @return {string}
 */
var maxValue = function(n, x) {
  const isNegative = n[0] === '-';
  const digits = n.slice(isNegative ? 1 : 0);
  let result = '';

  if (isNegative) {
    for (let i = 0; i <= digits.length; i++) {
      if (i === digits.length || x < parseInt(digits[i])) {
        result = '-' + digits.slice(0, i) + x + digits.slice(i);
        break;
      }
    }
  } else {
    for (let i = 0; i <= digits.length; i++) {
      if (i === digits.length || x > parseInt(digits[i])) {
        result = digits.slice(0, i) + x + digits.slice(i);
        break;
      }
    }
  }

  return result;
};
```

1882 Process Tasks Using Servers

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1882. Process Tasks Using Servers
 * https://leetcode.com/problems/process-tasks-using-servers/
 * Difficulty: Medium
 *
 * You are given two 0-indexed integer arrays servers and tasks of lengths n and m
respectively.
 * servers[i] is the weight of the ith server, and tasks[j] is the time needed to process the
 * jth task in seconds.
 *
 * Tasks are assigned to the servers using a task queue. Initially, all servers are free, and
 * the queue is empty.
 *
 * At second j, the jth task is inserted into the queue (starting with the 0th task being
inserted
 * at second 0). As long as there are free servers and the queue is not empty, the task in the
 front
 * of the queue will be assigned to a free server with the smallest weight, and in case of a
tie,
 * it is assigned to a free server with the smallest index.
 *
 * If there are no free servers and the queue is not empty, we wait until a server becomes
free
 * and immediately assign the next task. If multiple servers become free at the same time,
then
 * multiple tasks from the queue will be assigned in order of insertion following the weight
and
 * index priorities above.
 *
 * A server that is assigned task j at second t will be free again at second t + tasks[j].
```

```
 *
 * Build an array ans of length m, where ans[j] is the index of the server the jth task will
 * be assigned to.
 *
 * Return the array ans.
 */

/**
 * @param {number[]} servers
 * @param {number[]} tasks
 * @return {number[]}
 */
var assignTasks = function(servers, tasks) {
  const serverHeap = new PriorityQueue((a, b) => a[0] * 1000000 + a[1] - (b[0] * 1000000 +
b[1]));
  const busyHeap = new PriorityQueue((a, b) => a[0] - b[0]);
  const result = new Array(tasks.length);

  for (let i = 0; i < servers.length; i++) {
    serverHeap.enqueue([servers[i], i]);
  }

  let time = 0;
  let taskIndex = 0;

  while (taskIndex < tasks.length) {

      const [freeTime, weight, index] = busyHeap.dequeue();
      time = freeTime;
      serverHeap.enqueue([weight, index]);
    }
  }

  return result;
};
```

1883 Minimum Skips To Arrive At Meeting On Time

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1883. Minimum Skips to Arrive at Meeting On Time
 * https://leetcode.com/problems/minimum-skips-to-arrive-at-meeting-on-time/
 * Difficulty: Hard
 *
 * You are given an integer hoursBefore, the number of hours you have to travel to your
meeting.
 * To arrive at your meeting, you have to travel through n roads. The road lengths are given
as
 * an integer array dist of length n, where dist[i] describes the length of the ith road in
 * kilometers. In addition, you are given an integer speed, which is the speed (in km/h) you
 * will travel at.
 *
 * After you travel road i, you must rest and wait for the next integer hour before you can
begin
 * traveling on the next road. Note that you do not have to rest after traveling the last road
```

```
 * because you are already at the meeting.
 * - For example, if traveling a road takes 1.4 hours, you must wait until the 2 hour mark
before
 *   traveling the next road. If traveling a road takes exactly 2 hours, you do not need to
wait.
 *
 * However, you are allowed to skip some rests to be able to arrive on time, meaning you do
not
 * need to wait for the next integer hour. Note that this means you may finish traveling
future
 * roads at different hour marks.
 * - For example, suppose traveling the first road takes 1.4 hours and traveling the second
road
 *   takes 0.6 hours. Skipping the rest after the first road will mean you finish traveling
the
 *   second road right at the 2 hour mark, letting you start traveling the third road
immediately.
 *
 * Return the minimum number of skips required to arrive at the meeting on time, or -1 if it
is
 * impossible.
 */

1884 Egg Drop With 2 Eggs And N Floors

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1884. Egg Drop With 2 Eggs and N Floors
 * https://leetcode.com/problems/egg-drop-with-2-eggs-and-n-floors/
 * Difficulty: Medium
```

```
 *
 * You are given two identical eggs and you have access to a building with n floors labeled
 * from 1 to n.
 *
 * You know that there exists a floor f where 0 <= f <= n such that any egg dropped at a floor
 * higher than f will break, and any egg dropped at or below floor f will not break.
 *
 * In each move, you may take an unbroken egg and drop it from any floor x (where 1 <= x <=
n).
 * If the egg breaks, you can no longer use it. However, if the egg does not break, you may
 * reuse it in future moves.
 *
 * Return the minimum number of moves that you need to determine with certainty what the value
 * of f is.
 */

};
```

1889 Minimum Space Wasted From Packaging

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1889. Minimum Space Wasted From Packaging
 * https://leetcode.com/problems/minimum-space-wasted-from-packaging/
 * Difficulty: Hard
 *
 * You have n packages that you are trying to place in boxes, one package in each box. There
are
 * m suppliers that each produce boxes of different sizes (with infinite supply). A package
can
 * be placed in a box if the size of the package is less than or equal to the size of the box.
 *
 * The package sizes are given as an integer array packages, where packages[i] is the size of
the
 * ith package. The suppliers are given as a 2D integer array boxes, where boxes[j] is an
array
 * of box sizes that the jth supplier produces.
 *
 * You want to choose a single supplier and use boxes from them such that the total wasted
space
 * is minimized. For each package in a box, we define the space wasted to be size of the box -
 size
 * of the package. The total wasted space is the sum of the space wasted in all the boxes.
 * - For example, if you have to fit packages with sizes [2,3,5] and the supplier offers boxes
 of
 *   sizes [4,8], you can fit the packages of size-2 and size-3 into two boxes of size-4 and
the
 *   package with size-5 into a box of size-8. This would result in a waste
 *   of (4-2) + (4-3) + (8-5) = 6.
 *
 * Return the minimum total wasted space by choosing the box supplier optimally, or -1 if it
is
 * impossible to fit all the packages inside boxes. Since the answer may be large, return it
 * modulo 109 + 7.
 */

/**
 * @param {number[]} packages
 * @param {number[][]} boxes
 * @return {number}
 */

1896 Minimum Cost To Change The Final Value Of Expression

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1896. Minimum Cost to Change the Final Value of Expression
 * https://leetcode.com/problems/minimum-cost-to-change-the-final-value-of-expression/
 * Difficulty: Hard
 *
 * You are given a valid boolean expression as a string expression consisting of the
 * characters '1','0','&' (bitwise AND operator),'|' (bitwise OR operator),'(', and ')'.
 * - For example, "()1|1" and "(1)&()" are not valid while "1", "(((1))|(0))", and "1|(0&(1))"
 *   are valid expressions.
 *
 * Return the minimum cost to change the final value of the expression.
 * - For example, if expression = "1|1|(0&0)&1", its value is
 *   1|1|(0&0)&1 = 1|1|0&1 = 1|0&1 = 1&1 = 1. We want to apply operations so that the new
 *   expression evaluates to 0.
 *
```

```
 * The cost of changing the final value of an expression is the number of operations performed
 * on the expression. The types of operations are described as follows:
 * - Turn a '1' into a '0'.
 * - Turn a '0' into a '1'.
 * - Turn a '&' into a '|'.
 * - Turn a '|' into a '&'.
 *
 * Note: '&' does not take precedence over '|' in the order of calculation. Evaluate
parentheses
 * first, then in left-to-right order.

  }

  return true;
};
```

1898 Maximum Number Of Removable Characters

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1898. Maximum Number of Removable Characters
 * https://leetcode.com/problems/maximum-number-of-removable-characters/
 * Difficulty: Medium
 *
 * You are given two strings s and p where p is a subsequence of s. You are also given a
distinct
 * 0-indexed integer array removable containing a subset of indices of s (s is also
0-indexed).
 *
 * You want to choose an integer k (0 <= k <= removable.length) such that, after removing k
 * characters from s using the first k indices in removable, p is still a subsequence of s.
 * More formally, you will mark the character at s[removable[i]] for each 0 <= i < k, then
 * remove all marked characters and check if p is still a subsequence.
 *
 * Return the maximum k you can choose such that p is still a subsequence of s after the
removals.
 *
 * A subsequence of a string is a new string generated from the original string with some
 * characters (can be none) deleted without changing the relative order of the remaining
characters.
 */

/**
 * @param {string} s
 * @param {string} p
 * @param {number[]} removable
 * @return {number}
 */
var maximumRemovals = function(s, p, removable) {
  let left = 0;
  let right = removable.length;

  while (left <= right) {
    const mid = (left + right) >> 1;
    const removed = new Set(removable.slice(0, mid));
    let i = 0;
    let j = 0;

    while (i < s.length && j < p.length) {
      if (!removed.has(i) && s[i] === p[j]) {
        j++;
      }
      i++;
    }

    if (j === p.length) {

    }
  }

  return right;
};
```

1899 Merge Triplets To Form Target Triplet

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 1899. Merge Triplets to Form Target Triplet
 * https://leetcode.com/problems/merge-triplets-to-form-target-triplet/
 * Difficulty: Medium
 *
 * A triplet is an array of three integers. You are given a 2D integer array triplets, where
 * triplets[i] = [ai, bi, ci] describes the ith triplet. You are also given an integer array
 * target = [x, y, z] that describes the triplet you want to obtain.
 *
 * To obtain target, you may apply the following operation on triplets any number of times
 * (possibly zero):
 * - Choose two indices (0-indexed) i and j (i != j) and update triplets[j] to become
 *   [max(ai, aj), max(bi, bj), max(ci, cj)].
 *   - For example, if triplets[i] = [2, 5, 3] and triplets[j] = [1, 7, 5], triplets[j] will
 *     be updated to [max(2, 1), max(5, 7), max(3, 5)] = [2, 7, 5].
 *
 * Return true if it is possible to obtain the target triplet [x, y, z] as an element of
triplets,
 * or false otherwise.
 */

/**
 * @param {number[][]} triplets
 * @param {number[]} target
 * @return {boolean}
 */

      if (c === target[2]) canFormZ = true;
    }
  }

  return canFormX && canFormY && canFormZ;
};
```

1900 The Earliest And Latest Rounds Where Players Compete

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 1900. The Earliest and Latest Rounds Where Players Compete
 * https://leetcode.com/problems/the-earliest-and-latest-rounds-where-players-compete/
 * Difficulty: Hard
 *
 * There is a tournament where n players are participating. The players are standing in a
single row
 * and are numbered from 1 to n based on their initial standing position (player 1 is the
first
 * player in the row, player 2 is the second player in the row, etc.).
 *
 * The tournament consists of multiple rounds (starting from round number 1). In each round,
the ith
 * player from the front of the row competes against the ith player from the end of the row,
and the
 * winner advances to the next round. When the number of players is odd for the current round,
 the
 * player in the middle automatically advances to the next round.
 * - For example, if the row consists of players 1, 2, 4, 6, 7
 *   - Player 1 competes against player 7.
 *   - Player 2 competes against player 6.
 *   - Player 4 automatically advances to the next round.
 *
 * After each round is over, the winners are lined back up in the row based on the original
```

```
ordering
 * assigned to them initially (ascending order).
 *
 * The players numbered firstPlayer and secondPlayer are the best in the tournament. They can
win
 * against any other player before they compete against each other. If any two other players
compete
 * against each other, either of them might win, and thus you may choose the outcome of this
round.
 *
 * Given the integers n, firstPlayer, and secondPlayer, return an integer array containing two
 * values, the earliest possible round number and the latest possible round number in which
these
 * two players will compete against each other, respectively.
 */

1902 Depth Of Bst Given Insertion Order

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1902. Depth of BST Given Insertion Order
 * https://leetcode.com/problems/depth-of-bst-given-insertion-order/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array order of length n, a permutation of integers
 * from 1 to n representing the order of insertion into a binary search tree.
 *
 * A binary search tree is defined as follows:
 * - The left subtree of a node contains only nodes with keys less than the node's key.
 * - The right subtree of a node contains only nodes with keys greater than the node's key.
 * - Both the left and right subtrees must also be binary search trees.
 *
 * The binary search tree is constructed as follows:
 * - order[0] will be the root of the binary search tree.
 * - All subsequent elements are inserted as the child of any existing node such that the
 *   binary search tree properties hold.
 *
 * Return the depth of the binary search tree.
 *
 * A binary tree's depth is the number of nodes along the longest path from the root node
 * down to the farthest leaf node.
 */

1906 Minimum Absolute Difference Queries

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1906. Minimum Absolute Difference Queries
 * https://leetcode.com/problems/minimum-absolute-difference-queries/
 * Difficulty: Medium
 *
 * The minimum absolute difference of an array a is defined as the minimum value of |a[i] -
a[j]|,
 * where 0 <= i < j < a.length and a[i] != a[j]. If all elements of a are the same, the
minimum
 * absolute difference is -1.
 * - For example, the minimum absolute difference of the array [5,2,3,7,2] is |2 - 3| = 1.
Note
 *   that it is not 0 because a[i] and a[j] must be different.
 *
 * You are given an integer array nums and the array queries where queries[i] = [li, ri]. For
each
 * query i, compute the minimum absolute difference of the subarray nums[li...ri] containing
the
 * elements of nums between the 0-based indices li and ri (inclusive).
 *
 * Return an array ans where ans[i] is the answer to the ith query.
 *
 * A subarray is a contiguous sequence of elements in an array.
 *
 * The value of |x| is defined as:
 * - x if x >= 0.
 * - -x if x < 0.
 */

/**
 * @param {number[]} nums

```

1912 Design Movie Rental System

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1912. Design Movie Rental System
 * https://leetcode.com/problems/design-movie-rental-system/
 * Difficulty: Hard
 *
 * You have a movie renting company consisting of n shops. You want to implement a renting
system
 * that supports searching for, booking, and returning movies. The system should also support
 * generating a report of the currently rented movies.
 *
 * Each movie is given as a 2D integer array entries where entries[i] = [shopi, moviei,
pricei]
 * indicates that there is a copy of movie moviei at shop shopi with a rental price of pricei.
 * Each shop carries at most one copy of a movie moviei.
 *
 * The system should support the following functions:
 * - Search: Finds the cheapest 5 shops that have an unrented copy of a given movie. The shops
 *   should be sorted by price in ascending order, and in case of a tie, the one with the
smaller
 *   shopi should appear first. If there are less than 5 matching shops, then all of them
should be
 *   returned. If no shop has an unrented copy, then an empty list should be returned.
```

```
 * - Rent: Rents an unrented copy of a given movie from a given shop.
 * - Drop: Drops off a previously rented copy of a given movie at a given shop.
 * - Report: Returns the cheapest 5 rented movies (possibly of the same movie ID) as a 2D list
 res
 *   where res[j] = [shopj, moviej] describes that the jth cheapest rented movie moviej was
rented
 *   from the shop shopj. The movies in res should be sorted by price in ascending order, and
in
 *   case of a tie, the one with the smaller shopj should appear first, and if there is still
tie,
 *   the one with the smaller moviej should appear first. If there are fewer than 5 rented
movies,
 *   then all of them should be returned. If no movies are currently being rented, then an
empty
 *   list should be returned.
 *
 * Implement the MovieRentingSystem class:
 * - MovieRentingSystem(int n, int[][] entries) Initializes the MovieRentingSystem object with
 n
 *   shops and the movies in entries.
 * - List<Integer> search(int movie) Returns a list of shops that have an unrented copy of the
 *   given movie as described above.
 * - void rent(int shop, int movie) Rents the given movie from the given shop.
 * - void drop(int shop, int movie) Drops off a previously rented movie at the given shop.
 * - List<List<Integer>> report() Returns a list of cheapest rented movies as described above.
 *
 * Note: The test cases will be generated such that rent will only be called if the shop has
an
 * unrented copy of the movie, and drop will only be called if the shop had previously rented
out
 * the movie.
 */

  return nums.map(n => nums[n]);
};
```

1921 Eliminate Maximum Number Of Monsters

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1921. Eliminate Maximum Number of Monsters
 * https://leetcode.com/problems/eliminate-maximum-number-of-monsters/
 * Difficulty: Medium
 *
 * You are playing a video game where you are defending your city from a group of n monsters.
You
 * are given a 0-indexed integer array dist of size n, where dist[i] is the initial distance
in
 * kilometers of the ith monster from the city.
 *
 * The monsters walk toward the city at a constant speed. The speed of each monster is given
to
 * you in an integer array speed of size n, where speed[i] is the speed of the ith monster in
 * kilometers per minute.
 *
 * You have a weapon that, once fully charged, can eliminate a single monster. However, the
weapon
 * takes one minute to charge. The weapon is fully charged at the very start.
 *
 * You lose when any monster reaches your city. If a monster reaches the city at the exact
moment
 * the weapon is fully charged, it counts as a loss, and the game ends before you can use your
 * weapon.
```

```
 *
 * Return the maximum number of monsters that you can eliminate before you lose, or n if you
can
 * eliminate all the monsters before they reach the city.
 */

/**
 * 1924. Erect the Fence II
 * https://leetcode.com/problems/erect-the-fence-ii/
 * Difficulty: Hard
 *
 * You are given a 2D integer array trees where trees[i] = [xi, yi] represents the location
 * of the ith tree in the garden.
 *
 * You are asked to fence the entire garden using the minimum length of rope possible. The
garden
 * is well-fenced only if all the trees are enclosed and the rope used forms a perfect circle.
 * A tree is considered enclosed if it is inside or on the border of the circle.
 *
 * More formally, you must form a circle using the rope with a center (x, y) and radius r
where
 * all trees lie inside or on the circle and r is minimum.
 *
 * Return the center and radius of the circle as a length 3 array [x, y, r]. Answers within
10-5
 * of the actual answer will be accepted.
 */

1927 Sum Game

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1927. Sum Game
 * https://leetcode.com/problems/sum-game/
 * Difficulty: Medium
 *
 * Alice and Bob take turns playing a game, with Alice starting first.
 *
 * You are given a string num of even length consisting of digits and '?' characters. On each
 * turn, a player will do the following if there is still at least one '?' in num:
 * 1. Choose an index i where num[i] == '?'.
 * 2. Replace num[i] with any digit between '0' and '9'.
 *
 * The game ends when there are no more '?' characters in num.
 *
 * For Bob to win, the sum of the digits in the first half of num must be equal to the sum of
 * the digits in the second half. For Alice to win, the sums must not be equal.
 * - For example, if the game ended with num = "243801", then Bob wins because 2+4+3 = 8+0+1.
 *   If the game ended with num = "243803", then Alice wins because 2+4+3 != 8+0+3.
 *
 * Assuming Alice and Bob play optimally, return true if Alice will win and false if Bob will
win.
 */

1928 Minimum Cost To Reach Destination In Time

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1928. Minimum Cost to Reach Destination in Time
 * https://leetcode.com/problems/minimum-cost-to-reach-destination-in-time/
 * Difficulty: Hard
 *
```

```
 * There is a country of n cities numbered from 0 to n - 1 where all the cities are connected
by
 * bi-directional roads. The roads are represented as a 2D integer array edges where
 * edges[i] = [xi, yi, timei] denotes a road between cities xi and yi that takes timei minutes
 * to travel. There may be multiple roads of differing travel times connecting the same two
 * cities, but no road connects a city to itself.
 *
 * Each time you pass through a city, you must pay a passing fee. This is represented as a
 * 0-indexed integer array passingFees of length n where passingFees[j] is the amount of
dollars
 * you must pay when you pass through city j.
 *
 * In the beginning, you are at city 0 and want to reach city n - 1 in maxTime minutes or
less.
 * The cost of your journey is the summation of passing fees for each city that you passed
 * through at some moment of your journey (including the source and destination cities).
 *
 * Given maxTime, edges, and passingFees, return the minimum cost to complete your journey,
 * or -1 if you cannot complete it within maxTime minutes.
 */

    }

    prevRow = currRow;
  }

  return Math.max(...prevRow);
};
```

1938 Maximum Genetic Difference Query

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 1938. Maximum Genetic Difference Query
 * https://leetcode.com/problems/maximum-genetic-difference-query/
 * Difficulty: Hard
 *
 * There is a rooted tree consisting of n nodes numbered 0 to n - 1. Each node's number
denotes
 * its unique genetic value (i.e. the genetic value of node x is x). The genetic difference
 * between two genetic values is defined as the bitwise-XOR of their values. You are given
 * the integer array parents, where parents[i] is the parent for node i. If node x is the root
 * of the tree, then parents[x] == -1.
 *
 * You are also given the array queries where queries[i] = [nodei, vali]. For each query i,
 * find the maximum genetic difference between vali and pi, where pi is the genetic value of
 * any node that is on the path between nodei and the root (including nodei and the root).
 * More formally, you want to maximize vali XOR pi.
 *
 * Return an array ans where ans[i] is the answer to the ith query.
 */

  for (const [num, count] of map) {
    if (count === totalArrays) {
      result.push(num);
    }
  }

  return result.sort((a, b) => a - b);
};
```

1941 Check If All Characters Have Equal Number Of Occurrences

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1941. Check if All Characters Have Equal Number of Occurrences
 * https://leetcode.com/problems/check-if-all-characters-have-equal-number-of-occurrences/
 * Difficulty: Easy
 *
 * Given a string s, return true if s is a good string, or false otherwise.
 *
 * A string s is good if all the characters that appear in s have the same number of
occurrences
 * (i.e., the same frequency).
 */

/**
 * @param {string} s
 * @return {boolean}
 */
var areOccurrencesEqual = function(s) {
  const map = new Map();
  for (const char of s) {
    map.set(char, (map.get(char) || 0) + 1);
  }

  const frequencies = new Set(map.values());
  return frequencies.size === 1;
};
```

1942 The Number Of The Smallest Unoccupied Chair

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1942. The Number of the Smallest Unoccupied Chair
 * https://leetcode.com/problems/the-number-of-the-smallest-unoccupied-chair/
 * Difficulty: Medium
 *
 * There is a party where n friends numbered from 0 to n - 1 are attending. There is an
infinite
```

```
 * number of chairs in this party that are numbered from 0 to infinity. When a friend arrives
at
 * the party, they sit on the unoccupied chair with the smallest number.
 * - For example, if chairs 0, 1, and 5 are occupied when a friend comes, they will sit on
chair
 *   number 2.
 *
 * When a friend leaves the party, their chair becomes unoccupied at the moment they leave.
 * If another friend arrives at that same moment, they can sit in that chair.
 *
 * You are given a 0-indexed 2D integer array times where times[i] = [arrivali, leavingi],
 * indicating the arrival and leaving times of the ith friend respectively, and an integer
 * targetFriend. All arrival times are distinct.
 *
 * Return the chair number that the friend numbered targetFriend will sit on.
 */

/**
 * @param {number[][]} times
 * @param {number} targetFriend
 * @return {number}
 */
var smallestChair = function(times, targetFriend) {
  const events = [];

  for (let i = 0; i < times.length; i++) {
    events.push([times[i][0], 'arrive', i]);
    events.push([times[i][1], 'leave', i]);
  }

  events.sort((a, b) => a[0] - b[0] || (a[1] === 'leave' ? -1 : 1));

  const availableChairs = [];

        return assignedChair;
      }
    }
  }
};
```

1943 Describe The Painting

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1943. Describe the Painting
 * https://leetcode.com/problems/describe-the-painting/
 * Difficulty: Medium
 *
 * There is a long and thin painting that can be represented by a number line. The painting
was
```

```
 * painted with multiple overlapping segments where each segment was painted with a unique
color.
 * You are given a 2D integer array segments, where segments[i] = [starti, endi, colori]
 * represents the half-closed segment [starti, endi) with colori as the color.
 *
 * The colors in the overlapping segments of the painting were mixed when it was painted. When
 * two or more colors mix, they form a new color that can be represented as a set of mixed
colors.
 * - For example, if colors 2, 4, and 6 are mixed, then the resulting mixed color is {2,4,6}.
 *
 * For the sake of simplicity, you should only output the sum of the elements in the set
rather
 * than the full set.
 *
 * You want to describe the painting with the minimum number of non-overlapping half-closed
 * segments of these mixed colors. These segments can be represented by the 2D array painting
 * where painting[j] = [leftj, rightj, mixj] describes a half-closed segment [leftj, rightj)
 * with the mixed color sum of mixj.
 * - For example, the painting created with segments = [[1,4,5],[1,7,7]] can be described by
 *   painting = [[1,4,12],[4,7,7]] because:
 *   - [1,4) is colored {5,7} (with a sum of 12) from both the first and second segments.
 *   - [4,7) is colored {7} from only the second segment.
 *
 * Return the 2D array painting describing the finished painting (excluding any parts that are
 * not painted). You may return the segments in any order.
 *
 * A half-closed segment [a, b) is the section of the number line between points a and b
including
 * point a and not including point b.
 */

/**
 * @param {number[][]} segments
 * @return {number[][]}
 */
var splitPainting = function(segments) {
  const events = [];
  for (const [start, end, color] of segments) {
    events.push([start, color]);
    events.push([end, -color]);
  }

  events.sort((a, b) => a[0] - b[0] || a[1] - b[1]);

  const result = [];
  let currentSum = 0;
  let prevPoint = events[0][0];

  for (const [point, color] of events) {
    if (currentSum > 0 && point > prevPoint) {
      result.push([prevPoint, point, currentSum]);
    }
    currentSum += color;
    prevPoint = point;
  }

  return result;
};
```

1944 Number Of Visible People In A Queue

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1944. Number of Visible People in a Queue
 * https://leetcode.com/problems/number-of-visible-people-in-a-queue/
 * Difficulty: Hard
 *
 * There are n people standing in a queue, and they numbered from 0 to n - 1 in left to right
 * order. You are given an array heights of distinct integers where heights[i] represents the
```

```
 * height of the ith person.
 *
 * A person can see another person to their right in the queue if everybody in between is
 * shorter than both of them. More formally, the ith person can see the jth person
 * if i < j and min(heights[i], heights[j]) > max(heights[i+1], heights[i+2], ...,
heights[j-1]).
 *
 * Return an array answer of length n where answer[i] is the number of people the ith person
 * can see to their right in the queue.
 */

/**
 * @param {number[]} heights
 * @return {number[]}
 */
var canSeePersonsCount = function(heights) {
  const n = heights.length;
  const result = new Array(n).fill(0);
  const stack = [];

  for (let i = n - 1; i >= 0; i--) {
    while (stack.length && heights[i] > stack[stack.length - 1]) {
      stack.pop();
      result[i]++;
    }
    if (stack.length) {
      result[i]++;
    }
    stack.push(heights[i]);
  }

  return result;
};
```

1945 Sum Of Digits Of String After Convert

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1945. Sum of Digits of String After Convert
 * https://leetcode.com/problems/sum-of-digits-of-string-after-convert/
 * Difficulty: Easy
 *
 * You are given a string s consisting of lowercase English letters, and an integer k. Your
task
 * is to convert the string into an integer by a special process, and then transform it by
 * summing its digits repeatedly k times. More specifically, perform the following steps:
 * 1. Convert s into an integer by replacing each letter with its position in the alphabet
(i.e.
 *    replace 'a' with 1, 'b' with 2, ..., 'z' with 26).
 * 2. Transform the integer by replacing it with the sum of its digits.
 * 3. Repeat the transform operation (step 2) k times in total.
 *
 * For example, if s = "zbax" and k = 2, then the resulting integer would be 8 by the
following
 * operations:
 * 1. Convert: "zbax" → "(26)(2)(1)(24)" → "262124" → 262124
 * 2. Transform #1: 262124 → 2 + 6 + 2 + 1 + 2 + 4 → 17
 * 3. Transform #2: 17 → 1 + 7 → 8
 *
 * Return the resulting integer after performing the operations described above.
 */

/**
 * @param {string} s
 * @param {number} k
 * @return {number}
 */
var getLucky = function(s, k) {
  let number = '';
```

```
  for (const char of s) {
    number += (char.charCodeAt(0) - 96).toString();
  }

  let result = 0;
  for (let i = 0; i < k; i++) {
    result = 0;
    for (const digit of number) {
      result += parseInt(digit);
    }
    number = result.toString();
  }

  return result;
};
```

1946 Largest Number After Mutating Substring

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1946. Largest Number After Mutating Substring
 * https://leetcode.com/problems/largest-number-after-mutating-substring/
 * Difficulty: Medium
 *
 * You are given a string num, which represents a large integer. You are also given a
0-indexed
 * integer array change of length 10 that maps each digit 0-9 to another digit. More formally,
 * digit d maps to digit change[d].
 *
 * You may choose to mutate a single substring of num. To mutate a substring, replace each
digit
 * num[i] with the digit it maps to in change (i.e. replace num[i] with change[num[i]]).
 *
 * Return a string representing the largest possible integer after mutating (or choosing not
to)
 * a single substring of num.
 *
 * A substring is a contiguous sequence of characters within the string.
 */

/**
 * @param {string} num
 * @param {number[]} change
 * @return {string}
 */
var maximumNumber = function(num, change) {
  const digits = num.split('');
  let mutated = false;

  for (let i = 0; i < digits.length; i++) {
    const currentDigit = parseInt(digits[i]);
    const mappedDigit = change[currentDigit];

    if (mappedDigit > currentDigit) {
      digits[i] = mappedDigit.toString();
      mutated = true;
    } else if (mappedDigit < currentDigit && mutated) {
      break;
    }
  }

  return digits.join('');
};
```

1947 Maximum Compatibility Score Sum

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1947. Maximum Compatibility Score Sum
 * https://leetcode.com/problems/maximum-compatibility-score-sum/
 * Difficulty: Medium
 *
 * There is a survey that consists of n questions where each question's answer is either 0
 * (no) or 1 (yes).
 *
 * The survey was given to m students numbered from 0 to m - 1 and m mentors numbered from
 * 0 to m - 1. The answers of the students are represented by a 2D integer array students
 * where students[i] is an integer array that contains the answers of the ith student
 * (0-indexed). The answers of the mentors are represented by a 2D integer array mentors
 * where mentors[j] is an integer array that contains the answers of the jth mentor
(0-indexed).
 *
 * Each student will be assigned to one mentor, and each mentor will have one student assigned
 * to them. The compatibility score of a student-mentor pair is the number of answers that
 * are the same for both the student and the mentor.
 * - For example, if the student's answers were [1, 0, 1] and the mentor's answers were
 *   [0, 0, 1], then their compatibility score is 2 because only the second and the third
 *   answers are the same.
 *
 * You are tasked with finding the optimal student-mentor pairings to maximize the sum of the
 * compatibility scores.
 *
 * Given students and mentors, return the maximum compatibility score sum that can be
achieved.
 */

/**
 * @param {number[][]} students
 * @param {number[][]} mentors
 * @return {number}
 */

      }
    }
  }
};
```

1948 Delete Duplicate Folders In System

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1948. Delete Duplicate Folders in System
 * https://leetcode.com/problems/delete-duplicate-folders-in-system/
 * Difficulty: Hard
 *
 * Due to a bug, there are many duplicate folders in a file system. You are given a 2D array
 * paths, where paths[i] is an array representing an absolute path to the ith folder in the
 * file system.
 * - For example, ["one", "two", "three"] represents the path "/one/two/three".
 *
 * Two folders (not necessarily on the same level) are identical if they contain the same
 * non-empty set of identical subfolders and underlying subfolder structure. The folders do
 * not need to be at the root level to be identical. If two or more folders are identical,
 * then mark the folders as well as all their subfolders.
 * - For example, folders "/a" and "/b" in the file structure below are identical. They (as
 *   well as their subfolders) should all be marked:
 *   - /a
 *   - /a/x
 *   - /a/x/y
 *   - /a/z
 *   - /b
 *   - /b/x
 *   - /b/x/y
 *   - /b/z
 * - However, if the file structure also included the path "/b/w", then the folders "/a" and
"/b"
 *   would not be identical. Note that "/a/x" and "/b/x" would still be considered identical
 *   even with the added folder.
 *
 * Once all the identical folders and their subfolders have been marked, the file system will
delete
 * all of them. The file system only runs the deletion once, so any folders that become
identical
 * after the initial deletion are not deleted.
 *
 * Return the 2D array ans containing the paths of the remaining folders after deleting all
the
 * marked folders. The paths may be returned in any order.
 */

```

1952 Three Divisors

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1952. Three Divisors
 * https://leetcode.com/problems/three-divisors/
 * Difficulty: Easy
 *
 * Given an integer n, return true if n has exactly three positive divisors. Otherwise,
 * return false.
 *
 * An integer m is a divisor of n if there exists an integer k such that n = k * m.
 */

/**
 * @param {number} n
 * @return {boolean}
 */
var isThree = function(n) {
  let divisorCount = 0;
```

```
  for (let i = 1; i <= n; i++) {
    if (n % i === 0) {
      divisorCount++;
      if (divisorCount > 3) return false;
    }
  }

  return divisorCount === 3;
};
```

1953 Maximum Number Of Weeks For Which You Can Work

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1953. Maximum Number of Weeks for Which You Can Work
 * https://leetcode.com/problems/maximum-number-of-weeks-for-which-you-can-work/
 * Difficulty: Medium
 *
 * There are n projects numbered from 0 to n - 1. You are given an integer array milestones
where
 * each milestones[i] denotes the number of milestones the ith project has.
 *
 * You can work on the projects following these two rules:
 * - Every week, you will finish exactly one milestone of one project. You must work every
week.
 * - You cannot work on two milestones from the same project for two consecutive weeks.
 * - Once all the milestones of all the projects are finished, or if the only milestones that
you
 *   can work on will cause you to violate the above rules, you will stop working. Note that
you
 *   may not be able to finish every project's milestones due to these constraints.
 *
 * Return the maximum number of weeks you would be able to work on the projects without
violating
 * the rules mentioned above.
 */

    total += count;
    maxMilestones = Math.max(maxMilestones, count);
  }

  return Math.min(total, 2 * (total - maxMilestones) + 1);
};
```

1954 Minimum Garden Perimeter To Collect Enough Apples

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1954. Minimum Garden Perimeter to Collect Enough Apples
 * https://leetcode.com/problems/minimum-garden-perimeter-to-collect-enough-apples/
 * Difficulty: Medium
 *
 * In a garden represented as an infinite 2D grid, there is an apple tree planted at every
```

```
 * integer coordinate. The apple tree planted at an integer coordinate (i, j) has |i| + |j|
 * apples growing on it.
 *
 * You will buy an axis-aligned square plot of land that is centered at (0, 0).
 *
 * Given an integer neededApples, return the minimum perimeter of a plot such that at least
 * neededApples apples are inside or on the perimeter of that plot.
 *
 * The value of |x| is defined as:
 * - x if x >= 0
 * - -x if x < 0
 */

/**
 * @param {number} neededApples
 * @return {number}
 */

  }

  return 8 * n;
};
```

1955 Count Number Of Special Subsequences

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1955. Count Number of Special Subsequences
 * https://leetcode.com/problems/count-number-of-special-subsequences/
 * Difficulty: Hard
 *
 * A sequence is special if it consists of a positive number of 0s, followed by a positive
number
 * of 1s, then a positive number of 2s.
 * - For example, [0,1,2] and [0,0,1,1,1,2] are special.
 * - In contrast, [2,1,0], [1], and [0,1,2,0] are not special.
 *
 * Given an array nums (consisting of only integers 0, 1, and 2), return the number of
different
 * subsequences that are special. Since the answer may be very large, return it modulo 109 +
7.
 *
 * A subsequence of an array is a sequence that can be derived from the array by deleting some
 * or no elements without changing the order of the remaining elements. Two subsequences are
 * different if the set of indices chosen are different.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */

      result += s[i];
      count = 1;
    }
  }

  return result;
};
```

1958 Check If Move Is Legal

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1958. Check if Move is Legal
 * https://leetcode.com/problems/check-if-move-is-legal/
 * Difficulty: Medium
 *
 * You are given a 0-indexed 8 x 8 grid board, where board[r][c] represents the cell (r, c) on
 a
 * game board. On the board, free cells are represented by '.', white cells are represented by
 * 'W', and black cells are represented by 'B'.
 *
 * Each move in this game consists of choosing a free cell and changing it to the color you
are
 * playing as (either white or black). However, a move is only legal if, after changing it,
the
 * cell becomes the endpoint of a good line (horizontal, vertical, or diagonal).
 *
 * A good line is a line of three or more cells (including the endpoints) where the endpoints
of
 * the line are one color, and the remaining cells in the middle are the opposite color (no
cells
 * in the line are free). You can find examples for good lines in the figure below.
 *
 * Given two integers rMove and cMove and a character color representing the color you are
playing
 * as (white or black), return true if changing cell (rMove, cMove) to color color is a legal
move,
 * or false if it is not legal.
 */
```

```
/**
 * @param {character[][]} board
 * @param {number} rMove
 * @param {number} cMove
 * @param {character} color
 * @return {boolean}
 */

1966 Binary Searchable Numbers In An Unsorted Array

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1966. Binary Searchable Numbers in an Unsorted Array
 * https://leetcode.com/problems/binary-searchable-numbers-in-an-unsorted-array/
 * Difficulty: Medium
 *
 * Consider a function that implements an algorithm similar to Binary Search. The function has
 * two input parameters: sequence is a sequence of integers, and target is an integer value.
 * The purpose of the function is to find if the target exists in the sequence.
 *
 * The pseudocode of the function is as follows:
 *
 * func(sequence, target)
 *   while sequence is not empty
 *     randomly choose an element from sequence as the pivot
 *     if pivot = target, return true
 *     else if pivot < target, remove pivot and all elements to its left from the sequence
 *     else, remove pivot and all elements to its right from the sequence
 *   end while
 *   return false
 *
 * When the sequence is sorted, the function works correctly for all values. When the sequence
 * is not sorted, the function does not work for all values, but may still work for some
values.
 *
 * Given an integer array nums, representing the sequence, that contains unique numbers and
may
 * or may not be sorted, return the number of values that are guaranteed to be found using the
 * function, for every possible pivot selection.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */

1969 Minimum Non Zero Product Of The Array Elements

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1969. Minimum Non-Zero Product of the Array Elements
 * https://leetcode.com/problems/minimum-non-zero-product-of-the-array-elements/
 * Difficulty: Medium
 *
 * You are given a positive integer p. Consider an array nums (1-indexed) that consists of the
 * integers in the inclusive range [1, 2p - 1] in their binary representations. You are
allowed
 * to do the following operation any number of times:
 * - Choose two elements x and y from nums.
 * - Choose a bit in x and swap it with its corresponding bit in y. Corresponding bit refers
to
 *   the bit that is in the same position in the other integer.
 *
 * For example, if x = 1101 and y = 0011, after swapping the 2nd bit from the right, we have
 * x = 1111 and y = 0001.
 *
 * Find the minimum non-zero product of nums after performing the above operation any number
 * of times. Return this product modulo 109 + 7.
 *
 * Note: The answer should be the minimum product before the modulo operation is done.
 */

/**
 * @param {number} p
 * @return {number}
 */
var minNonZeroProduct = function(p) {
  const MOD = 1000000007n;
  const maxVal = (1n << BigInt(p)) - 1n;

1970 Last Day Where You Can Still Cross

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1970. Last Day Where You Can Still Cross
 * https://leetcode.com/problems/last-day-where-you-can-still-cross/
```

```
 * Difficulty: Hard
 *
 * There is a 1-based binary matrix where 0 represents land and 1 represents water. You are
given
 * integers row and col representing the number of rows and columns in the matrix,
respectively.
 *
 * Initially on day 0, the entire matrix is land. However, each day a new cell becomes flooded
 * with water. You are given a 1-based 2D array cells, where cells[i] = [ri, ci] represents
that
 * on the ith day, the cell on the rith row and cith column (1-based coordinates) will be
covered
 * with water (i.e., changed to 1).
 *
 * You want to find the last day that it is possible to walk from the top to the bottom by
only
 * walking on land cells. You can start from any cell in the top row and end at any cell in
the
 * bottom row. You can only travel in the four cardinal directions (left, right, up, and
down).
 *
 * Return the last day where it is possible to walk from the top to the bottom by only walking
 * on land cells.
 */

1986 Minimum Number Of Work Sessions To Finish The Tasks

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1986. Minimum Number of Work Sessions to Finish the Tasks
 * https://leetcode.com/problems/minimum-number-of-work-sessions-to-finish-the-tasks/
 * Difficulty: Medium
 *
 * There are n tasks assigned to you. The task times are represented as an integer array tasks
 of
 * length n, where the ith task takes tasks[i] hours to finish. A work session is when you
work
 * for at most sessionTime consecutive hours and then take a break.
 *
 * You should finish the given tasks in a way that satisfies the following conditions:
 * - If you start a task in a work session, you must complete it in the same work session.
 * - You can start a new task immediately after finishing the previous one.
 * - You may complete the tasks in any order.
 *
 * Given tasks and sessionTime, return the minimum number of work sessions needed to finish
all the
 * tasks following the conditions above.
 *
 * The tests are generated such that sessionTime is greater than or equal to the maximum
element
 * in tasks[i].
 */

/**
 * @param {number[]} tasks
 * @param {number} sessionTime
 * @return {number}
 */

1987 Number Of Unique Good Subsequences

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1987. Number of Unique Good Subsequences
 * https://leetcode.com/problems/number-of-unique-good-subsequences/
 * Difficulty: Hard
 *
 * You are given a binary string binary. A subsequence of binary is considered good if it is
not
 * empty and has no leading zeros (with the exception of "0").
 *
 * Find the number of unique good subsequences of binary.
 * - For example, if binary = "001", then all the good subsequences are ["0", "0", "1"], so
the
 *   unique good subsequences are "0" and "1". Note that subsequences "00", "01", and "001"
are
 *   not good because they have leading zeros.
 *
 * Return the number of unique good subsequences of binary. Since the answer may be very
large,
 * return it modulo 109 + 7.
 *
 * A subsequence is a sequence that can be derived from another sequence by deleting some or
no
 * elements without changing the order of the remaining elements.
 */

/**
 * @param {string} binary
 * @return {number}
 */
var numberOfUniqueGoodSubsequences = function(binary) {

```

1992 Find All Groups Of Farmland

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1992. Find All Groups of Farmland
 * https://leetcode.com/problems/find-all-groups-of-farmland/
 * Difficulty: Medium
 *
 * You are given a 0-indexed m x n binary matrix land where a 0 represents a hectare of
forested
 * land and a 1 represents a hectare of farmland.
 *
 * To keep the land organized, there are designated rectangular areas of hectares that consist
 * entirely of farmland. These rectangular areas are called groups. No two groups are
adjacent,
 * meaning farmland in one group is not four-directionally adjacent to another farmland in a
 * different group.
 *
 * land can be represented by a coordinate system where the top left corner of land is (0, 0)
 * and the bottom right corner of land is (m-1, n-1). Find the coordinates of the top left and
 * bottom right corner of each group of farmland. A group of farmland with a top left corner
```

```
 * at (r1, c1) and a bottom right corner at (r2, c2) is represented by the 4-length
 * array [r1, c1, r2, c2].
 *
 * Return a 2D array containing the 4-length arrays described above for each group of farmland
 * in land. If there are no groups of farmland, return an empty array. You may return the
answer
 * in any order.
 */

/**
 * @param {number[][]} land
 * @return {number[][]}
 */
var findFarmland = function(land) {
  const m = land.length;
  const n = land[0].length;
  const result = [];

  for (let r = 0; r < m; r++) {
    for (let c = 0; c < n; c++) {
      if (land[r][c] === 1) {
        let r2 = r;
        let c2 = c;

        while (r2 + 1 < m && land[r2 + 1][c] === 1) r2++;
        while (c2 + 1 < n && land[r][c2 + 1] === 1) c2++;

        result.push([r, c, r2, c2]);

        for (let i = r; i <= r2; i++) {
          for (let j = c; j <= c2; j++) {
            land[i][j] = 0;
          }
        }
      }
    }
  }

  return result;
};
```

1993 Operations On Tree

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1993. Operations on Tree
 * https://leetcode.com/problems/operations-on-tree/
 * Difficulty: Medium
 *
 * You are given a tree with n nodes numbered from 0 to n - 1 in the form of a parent array
 * parent where parent[i] is the parent of the ith node. The root of the tree is node 0,
 * so parent[0] = -1 since it has no parent. You want to design a data structure that
 * allows users to lock, unlock, and upgrade nodes in the tree.
 *
 * The data structure should support the following functions:
 * - Lock: Locks the given node for the given user and prevents other users from locking
 *   the same node. You may only lock a node using this function if the node is unlocked.
 * - Unlock: Unlocks the given node for the given user. You may only unlock a node using
 *   this function if it is currently locked by the same user.
 * - Upgrade: Locks the given node for the given user and unlocks all of its descendants
 *   regardless of who locked it. You may only upgrade a node if all 3 conditions are true:
 *   - The node is unlocked,
 *   - It has at least one locked descendant (by any user), and
 *   - It does not have any locked ancestors.
 *
 * Implement the LockingTree class:
 * - LockingTree(int[] parent) initializes the data structure with the parent array.
 * - lock(int num, int user) returns true if it is possible for the user with id user to lock
```

```
 *   the node num, or false otherwise. If it is possible, the node num will become locked by
 *   the user with id user.
 * - unlock(int num, int user) returns true if it is possible for the user with id user to
 *   unlock the node num, or false otherwise. If it is possible, the node num will become
unlocked.
 * - upgrade(int num, int user) returns true if it is possible for the user with id user to
 *   upgrade the node num, or false otherwise. If it is possible, the node num will be
upgraded.
 */

/**
 * @param {number[]} parent
 */

  return -1;
};
```

2000 Reverse Prefix Of Word

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2000. Reverse Prefix of Word
 * https://leetcode.com/problems/reverse-prefix-of-word/
 * Difficulty: Easy
 *
 * Given a 0-indexed string word and a character ch, reverse the segment of word that
 * starts at index 0 and ends at the index of the first occurrence of ch (inclusive).
```

```
 * If the character ch does not exist in word, do nothing.
 *
 * For example, if word = "abcdefd" and ch = "d", then you should reverse the segment
 * that starts at 0 and ends at 3 (inclusive). The resulting string will be "dcbaefd".
 */

/**
 * @param {string} word
 * @param {character} ch
 * @return {string}
 */
var reversePrefix = function(word, ch) {
  const index = word.indexOf(ch) + 1;
  return word.slice(0, index).split('').reverse().join('') + word.slice(index);
};
```

2001 Number Of Pairs Of Interchangeable Rectangles

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2001. Number of Pairs of Interchangeable Rectangles
 * https://leetcode.com/problems/number-of-pairs-of-interchangeable-rectangles/
 * Difficulty: Medium
 *
 * You are given n rectangles represented by a 0-indexed 2D integer array rectangles,
 * where rectangles[i] = [widthi, heighti] denotes the width and height of the ith rectangle.
 *
 * Two rectangles i and j (i < j) are considered interchangeable if they have the same
 * width-to-height ratio. More formally, two rectangles are interchangeable if
 * widthi/heighti == widthj/heightj (using decimal division, not integer division).
 *
 * Return the number of pairs of interchangeable rectangles in rectangles.
 */

/**
 * @param {number[][]} rectangles
 * @return {number}
 */
var interchangeableRectangles = function(rectangles) {
  const map = new Map();
  let result = 0;

  for (const [width, height] of rectangles) {
    const gcd = (a, b) => b === 0 ? a : gcd(b, a % b);
    const divisor = gcd(width, height);
    const ratio = `${width / divisor}/${height / divisor}`;

  }

  return result;
};
```

2005 Subtree Removal Game With Fibonacci Tree

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2005. Subtree Removal Game with Fibonacci Tree
 * https://leetcode.com/problems/subtree-removal-game-with-fibonacci-tree/
 * Difficulty: Hard
 *
 * A Fibonacci tree is a binary tree created using the order function order(n):
 * - order(0) is the empty tree.
 * - order(1) is a binary tree with only one node.
 * - order(n) is a binary tree that consists of a root node with the left subtree as order(n -
 2)
 *   and the right subtree as order(n - 1).
 *
 * Alice and Bob are playing a game with a Fibonacci tree with Alice staring first. On each
turn,
 * a player selects a node and removes that node and its subtree. The player that is forced to
 * delete root loses.
 *
 * Given the integer n, return true if Alice wins the game or false if Bob wins, assuming both
 * players play optimally.
 *
 * A subtree of a binary tree tree is a tree that consists of a node in tree and all of this
```

```
 * node's descendants. The tree tree could also be considered as a subtree of itself.
 */

/**
 * @param {number} n
 * @return {boolean}
 */
var findGameWinner = function(n) {
  return n % 6 !== 1;
};
```

2006 Count Number Of Pairs With Absolute Difference K

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**

    }
  }

  return result;
};
```

2013 Detect Squares

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2013. Detect Squares
 * https://leetcode.com/problems/detect-squares/
 * Difficulty: Medium
 *
 * You are given a stream of points on the X-Y plane. Design an algorithm that:
 * - Adds new points from the stream into a data structure. Duplicate points are allowed and
should
 *   be treated as different points.
 * - Given a query point, counts the number of ways to choose three points from the data
structure
 *   such that the three points and the query point form an axis-aligned square with positive
area.
 *
 * An axis-aligned square is a square whose edges are all the same length and are either
parallel
 * or perpendicular to the x-axis and y-axis.
 *
 * Implement the DetectSquares class:
 * - DetectSquares() Initializes the object with an empty data structure.
 * - void add(int[] point) Adds a new point point = [x, y] to the data structure.
 * - int count(int[] point) Counts the number of ways to form axis-aligned squares with point
 *   point = [x, y] as described above.
 */

2015 Average Height Of Buildings In Each Segment

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2015. Average Height of Buildings in Each Segment
 * https://leetcode.com/problems/average-height-of-buildings-in-each-segment/
 * Difficulty: Medium
 *
 * A perfectly straight street is represented by a number line. The street has building(s) on
 * it and is represented by a 2D integer array buildings, where buildings[i] = [starti, endi,
 * heighti]. This means that there is a building with heighti in the half-closed
 * segment [starti, endi).
 *
 * You want to describe the heights of the buildings on the street with the minimum number of
 * non-overlapping segments. The street can be represented by the 2D integer array street
 * where street[j] = [leftj, rightj, averagej] describes a half-closed segment [leftj, rightj)
 * of the road where the average heights of the buildings in the segment is averagej.
 *
 * - For example, if buildings = [[1,5,2],[3,10,4]], the street could be represented by
 *   street = [[1,3,2],[3,5,3],[5,10,4]] because:
 *   - From 1 to 3, there is only the first building with an average height of 2 / 1 = 2.
 *   - From 3 to 5, both the first and the second building are there with an average height
 *     of (2+4) / 2 = 3.
 *   - From 5 to 10, there is only the second building with an average height of 4 / 1 = 4.
 *
 * Given buildings, return the 2D integer array street as described above (excluding any areas
 * of the street where there are no buldings). You may return the array in any order.
 *
 * The average of n elements is the sum of the n elements divided (integer division) by n.
 *
 * A half-closed segment [a, b) is the section of the number line between points a and b
including
 * point a and not including point b.
 */

/**

2018 Check If Word Can Be Placed In Crossword

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2018. Check if Word Can Be Placed In Crossword
 * https://leetcode.com/problems/check-if-word-can-be-placed-in-crossword/
 * Difficulty: Medium
 *
 * You are given an m x n matrix board, representing the current state of a crossword puzzle.
 * The crossword contains lowercase English letters (from solved words), ' ' to represent any
 * empty cells, and '#' to represent any blocked cells.
 *
 * A word can be placed horizontally (left to right or right to left) or vertically (top to
 * bottom or bottom to top) in the board if:
 * - It does not occupy a cell containing the character '#'.
 * - The cell each letter is placed in must either be ' ' (empty) or match the letter already
 *   on the board.
 * - There must not be any empty cells ' ' or other lowercase letters directly left or right
 *   of the word if the word was placed horizontally.
 * - There must not be any empty cells ' ' or other lowercase letters directly above or below
 *   the word if the word was placed vertically.
 *
 * Given a string word, return true if word can be placed in board, or false otherwise.
 */

2019 The Score Of Students Solving Math Expression

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2019. The Score of Students Solving Math Expression
 * https://leetcode.com/problems/the-score-of-students-solving-math-expression/
 * Difficulty: Hard
 *
 * You are given a string s that contains digits 0-9, addition symbols '+', and multiplication
 * symbols '*' only, representing a valid math expression of single digit numbers (e.g.,
3+5*2).
 * This expression was given to n elementary school students. The students were instructed to
 * get the answer of the expression by following this order of operations:
 * 1. Compute multiplication, reading from left to right; Then,
 * 2. Compute addition, reading from left to right.
 *
 * You are given an integer array answers of length n, which are the submitted answers of the
 * students in no particular order. You are asked to grade the answers, by following these
rules:
 * - If an answer equals the correct answer of the expression, this student will be rewarded
 *   5 points;
 * - Otherwise, if the answer could be interpreted as if the student applied the operators in
 *   the wrong order but had correct arithmetic, this student will be rewarded 2 points;
 * - Otherwise, this student will be rewarded 0 points.
 *
 * Return the sum of the points of the students.
 */

  }

  return operations;
};
```

2034 Stock Price Fluctuation

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2034. Stock Price Fluctuation
 * https://leetcode.com/problems/stock-price-fluctuation/
 * Difficulty: Medium
 *
 * You are given a stream of records about a particular stock. Each record contains a
timestamp
 * and the corresponding price of the stock at that timestamp.
 *
 * Unfortunately due to the volatile nature of the stock market, the records do not come in
order.
 * Even worse, some records may be incorrect. Another record with the same timestamp may
appear
 * later in the stream correcting the price of the previous wrong record.
 *
 * Design an algorithm that:
 * - Updates the price of the stock at a particular timestamp, correcting the price from any
 *   previous records at the timestamp.
 * - Finds the latest price of the stock based on the current records. The latest price is the
 *   price at the latest timestamp recorded.
 * - Finds the maximum price the stock has been based on the current records.
 * - Finds the minimum price the stock has been based on the current records.
 *
 * Implement the StockPrice class:
 * - StockPrice() Initializes the object with no price records.
 * - void update(int timestamp, int price) Updates the price of the stock at the given
timestamp.
 * - int current() Returns the latest price of the stock.
 * - int maximum() Returns the maximum price of the stock.
 * - int minimum() Returns the minimum price of the stock.
 */

var StockPrice = function() {
  this.timestamps = new Map();
  this.highestTimestamp = 0;
  this.minHeap = new PriorityQueue((a, b) => a[0] - b[0]);
  this.maxHeap = new PriorityQueue((a, b) => b[0] - a[0]);
};

/**
 * @param {number} timestamp
 * @param {number} price
 * @return {void}
 */
StockPrice.prototype.update = function(timestamp, price) {
  this.timestamps.set(timestamp, price);
  this.highestTimestamp = Math.max(this.highestTimestamp, timestamp);

  this.minHeap.enqueue([price, timestamp]);
  this.maxHeap.enqueue([price, timestamp]);
};

/**
 * @return {number}
 */

    }
  }

  return aliceMoves > bobMoves;
};
```

2039 The Time When The Network Becomes Idle

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2039. The Time When the Network Becomes Idle
 * https://leetcode.com/problems/the-time-when-the-network-becomes-idle/
 * Difficulty: Medium
 *
 * There is a network of n servers, labeled from 0 to n - 1. You are given a 2D integer array
 * edges, where edges[i] = [ui, vi] indicates there is a message channel between servers ui
 * and vi, and they can pass any number of messages to each other directly in one second.
 * You are also given a 0-indexed integer array patience of length n.
 *
 * All servers are connected, i.e., a message can be passed from one server to any other
 * server(s) directly or indirectly through the message channels.
 *
 * The server labeled 0 is the master server. The rest are data servers. Each data server
 * needs to send its message to the master server for processing and wait for a reply.
```

```
 * Messages move between servers optimally, so every message takes the least amount of
 * time to arrive at the master server. The master server will process all newly arrived
 * messages instantly and send a reply to the originating server via the reversed path
 * the message had gone through.
 *
 * At the beginning of second 0, each data server sends its message to be processed. Starting
 * from second 1, at the beginning of every second, each data server will check if it has
 * received a reply to the message it sent (including any newly arrived replies) from the
 * master server:
 * - If it has not, it will resend the message periodically. The data server i will resend
 *   the message every patience[i] second(s), i.e., the data server i will resend the message
 *   if patience[i] second(s) have elapsed since the last time the message was sent from this
 *   server.
 * - Otherwise, no more resending will occur from this server.
 *
 * The network becomes idle when there are no messages passing between servers or arriving
 * at servers.
 *
 * Return the earliest second starting from which the network becomes idle.
 */

/**
 * @param {number[][]} edges
 * @param {number[]} patience
 * @return {number}
 */

    else low = mid + 1;
  }

  return low;
};
```

2042 Check If Numbers Are Ascending In A Sentence

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2042. Check if Numbers Are Ascending in a Sentence
 * https://leetcode.com/problems/check-if-numbers-are-ascending-in-a-sentence/
 * Difficulty: Easy
 *
 * A sentence is a list of tokens separated by a single space with no leading or trailing
spaces.
 * Every token is either a positive number consisting of digits 0-9 with no leading zeros, or
a
 * word consisting of lowercase English letters.
 * - For example, "a puppy has 2 eyes 4 legs" is a sentence with seven tokens: "2" and "4" are
 *   numbers and the other tokens such as "puppy" are words.
 *
 * Given a string s representing a sentence, you need to check if all the numbers in s are
strictly
 * increasing from left to right (i.e., other than the last number, each number is strictly
smaller
 * than the number on its right in s).
 *
 * Return true if so, or false otherwise.
 */
```

```
/**
 * @param {string} s
 * @return {boolean}
 */
var areNumbersAscending = function(s) {
  const numbers = s.split(' ').filter(token => !isNaN(token)).map(Number);
  for (let i = 1; i < numbers.length; i++) {
    if (numbers[i] <= numbers[i - 1]) return false;
  }
  return true;
};
```

2043 Simple Bank System

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2043. Simple Bank System
 * https://leetcode.com/problems/simple-bank-system/
 * Difficulty: Medium
 *
 * You have been tasked with writing a program for a popular bank that will automate all its
 * incoming transactions (transfer, deposit, and withdraw). The bank has n accounts numbered
 * from 1 to n. The initial balance of each account is stored in a 0-indexed integer array
 * balance, with the (i + 1)th account having an initial balance of balance[i].
 *
 * Execute all the valid transactions. A transaction is valid if:
 * - The given account number(s) are between 1 and n, and
 * - The amount of money withdrawn or transferred from is less than or equal to the balance
 *   of the account.
 *
 * Implement the Bank class:
 * - Bank(long[] balance) Initializes the object with the 0-indexed integer array balance.
 * - boolean transfer(int account1, int account2, long money) Transfers money dollars from the
 *   account numbered account1 to the account numbered account2. Return true if the
transaction
 *   was successful, false otherwise.
 * - boolean deposit(int account, long money) Deposit money dollars into the account numbered
 *   account. Return true if the transaction was successful, false otherwise.
 * - boolean withdraw(int account, long money) Withdraw money dollars from the account
numbered
 *   account. Return true if the transaction was successful, false otherwise.
 */

/**
 * @param {number[]} balance
 */
var Bank = function(balance) {

2045 Second Minimum Time To Reach Destination

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2045. Second Minimum Time to Reach Destination
 * https://leetcode.com/problems/second-minimum-time-to-reach-destination/
 * Difficulty: Hard
 *
 * A city is represented as a bi-directional connected graph with n vertices where each vertex
 * is labeled from 1 to n (inclusive). The edges in the graph are represented as a 2D integer
 * array edges, where each edges[i] = [ui, vi] denotes a bi-directional edge between vertex
 * ui and vertex vi. Every vertex pair is connected by at most one edge, and no vertex has
 * an edge to itself. The time taken to traverse any edge is time minutes.
 *
 * Each vertex has a traffic signal which changes its color from green to red and vice versa
 * every change minutes. All signals change at the same time. You can enter a vertex at any
 * time, but can leave a vertex only when the signal is green. You cannot wait at a vertex
 * if the signal is green.
 *
 * The second minimum value is defined as the smallest value strictly larger than the minimum
value.
 * - For example the second minimum value of [2, 3, 4] is 3, and the second minimum value of
 *   [2, 2, 4] is 4.
 *
 * Given n, edges, time, and change, return the second minimum time it will take to go from
 * vertex 1 to vertex n.
 */

/**
 * @param {number} n

/**
 * 2047. Number of Valid Words in a Sentence
 * https://leetcode.com/problems/number-of-valid-words-in-a-sentence/
 * Difficulty: Easy
 *
 * A sentence consists of lowercase letters ('a' to 'z'), digits ('0' to '9'),
 * hyphens ('-'), punctuation marks ('!', '.', and ','), and spaces (' ') only.
 * Each sentence can be broken down into one or more tokens separated by one or
 * more spaces ' '.
 *
 * A token is a valid word if all three of the following are true:
```

```
 * - It only contains lowercase letters, hyphens, and/or punctuation (no digits).
 * - There is at most one hyphen '-'. If present, it must be surrounded by lowercase
 *   characters ("a-b" is valid, but "-ab" and "ab-" are not valid).
 * - There is at most one punctuation mark. If present, it must be at the end of
 *   the token ("ab,", "cd!", and "." are valid, but "a!b" and "c.," are not valid).
 *
 * Examples of valid words include "a-b.", "afad", "ba-c", "a!", and "!".
 *
 * Given a string sentence, return the number of valid words in sentence.
 */

/**
 * @param {string} sentence
 * @return {number}
 */
var countValidWords = function(sentence) {
  return sentence.trim().split(/\s+/).reduce((total, str) => {
    return total + (/^(?:([a-z]+\-?[a-z]+)|([a-z+]))?[!.,]?$/.test(str) ? 1 : 0);
  }, 0);
};
```

2048 Next Greater Numerically Balanced Number

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2048. Next Greater Numerically Balanced Number
 * https://leetcode.com/problems/next-greater-numerically-balanced-number/
 * Difficulty: Medium
 *
 * An integer x is numerically balanced if for every digit d in the number x, there are
exactly
 * d occurrences of that digit in x.
 *
 * Given an integer n, return the smallest numerically balanced number strictly greater than
n.
 */

/**
 * @param {number} n
 * @return {number}
 */
var nextBeautifulNumber = function(n) {
  let candidate = n + 1;
  while (candidate <= 10000000) {

2049 Count Nodes With The Highest Score

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2049. Count Nodes With the Highest Score
 * https://leetcode.com/problems/count-nodes-with-the-highest-score/
 * Difficulty: Medium
 *
 * There is a binary tree rooted at 0 consisting of n nodes. The nodes are labeled from 0 to n
 - 1.
 * You are given a 0-indexed integer array parents representing the tree, where parents[i] is
the
 * parent of node i. Since node 0 is the root, parents[0] == -1.
 *
 * Each node has a score. To find the score of a node, consider if the node and the edges
connected
 * to it were removed. The tree would become one or more non-empty subtrees. The size of a
subtree
 * is the number of the nodes in it. The score of the node is the product of the sizes of all
 * those subtrees.
 *
 * Return the number of nodes that have the highest score.
 */

/**
 * @param {number[]} parents
 * @return {number}
 */

```

2050 Parallel Courses Iii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2050. Parallel Courses III
 * https://leetcode.com/problems/parallel-courses-iii/
 * Difficulty: Hard
 *
 * You are given an integer n, which indicates that there are n courses labeled from 1 to n.
 * You are also given a 2D integer array relations where relations[j] = [prevCoursej,
nextCoursej]
 * denotes that course prevCoursej has to be completed before course nextCoursej (prerequisite
 * relationship). Furthermore, you are given a 0-indexed integer array time where time[i]
denotes
 * how many months it takes to complete the (i+1)th course.
 *
 * You must find the minimum number of months needed to complete all the courses following
these
 * rules:
 * - You may start taking a course at any time if the prerequisites are met.
 * - Any number of courses can be taken at the same time.
 *
 * Return the minimum number of months needed to complete all the courses.
 *
 * Note: The test cases are generated such that it is possible to complete every course (i.e.,
 the
 * graph is a directed acyclic graph).
 */

/**
 * @param {number} n
 * @param {number[][]} relations
 * @param {number[]} time
 * @return {number}
 */
var minimumTime = function(n, relations, time) {
  const adjacencyList = Array.from({ length: n + 1 }, () => []);

```

2052 Minimum Cost To Separate Sentence Into Rows

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2052. Minimum Cost to Separate Sentence Into Rows
 * https://leetcode.com/problems/minimum-cost-to-separate-sentence-into-rows/
 * Difficulty: Medium
 *
 * You are given a string sentence containing words separated by spaces, and an integer k.
 * Your task is to separate sentence into rows where the number of characters in each row
 * is at most k. You may assume that sentence does not begin or end with a space, and the
 * words in sentence are separated by a single space.
 *
 * You can split sentence into rows by inserting line breaks between words in sentence.
 * A word cannot be split between two rows. Each word must be used exactly once, and the
 * word order cannot be rearranged. Adjacent words in a row should be separated by a single
 * space, and rows should not begin or end with spaces.
 *
 * The cost of a row with length n is (k - n)2, and the total cost is the sum of the costs
 * for all rows except the last one.
 * - For example if sentence = "i love leetcode" and k = 12:
 *   - Separating sentence into "i", "love", and "leetcode" has a cost
 *     of (12 - 1)2 + (12 - 4)2 = 185.
 *   - Separating sentence into "i love", and "leetcode" has a cost of (12 - 6)2 = 36.
 *   - Separating sentence into "i", and "love leetcode" is not possible because the
 *     length of "love leetcode" is greater than k.
 *
 * Return the minimum possible total cost of separating sentence into rows.
 */

/**
 * @param {string} sentence
 * @param {number} k
 * @return {number}
 */
var minimumCost = function(sentence, k) {
  const words = sentence.split(' ');
  const n = words.length;
  const map = new Map();

  return dp(0);

  function dp(wordIndex) {
    if (wordIndex === n) return 0;
    if (map.has(wordIndex)) return map.get(wordIndex);

    let currentLength = 0;
    let minCost = Infinity;

    for (let i = wordIndex; i < n; i++) {
      if (i > wordIndex) currentLength += 1;
      currentLength += words[i].length;

      if (currentLength > k) break;

      const remainingCost = dp(i + 1);
      const currentCost = i === n - 1 ? 0 : (k - currentLength) ** 2;
      minCost = Math.min(minCost, currentCost + remainingCost);
    }

    map.set(wordIndex, minCost);
    return minCost;
  }
};
```

2053 Kth Distinct String In An Array

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2053. Kth Distinct String in an Array
 * https://leetcode.com/problems/kth-distinct-string-in-an-array/
 * Difficulty: Medium
 *
 * A distinct string is a string that is present only once in an array.
 *
 * Given an array of strings arr, and an integer k, return the kth distinct
 * string present in arr. If there are fewer than k distinct strings, return
 * an empty string "".
 *
 * Note that the strings are considered in the order in which they appear in
 * the array.
 */

/**
 * @param {string[]} arr
 * @param {number} k
 * @return {string}
 */
var kthDistinct = function(arr, k) {
  const map = new Map();
  arr.forEach(n => map.set(n, (map.get(n) || 0) + 1));

  const sorted = [...map].sort(([,a], [,b]) => a - b);
  const [kth, count] = sorted[k - 1] || [];

  return count === 1 ? kth : '';
};
```

2054 Two Best Non Overlapping Events

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2054. Two Best Non-Overlapping Events
 * https://leetcode.com/problems/two-best-non-overlapping-events/
 * Difficulty: Medium
 *
 * You are given a 0-indexed 2D integer array of events where
 * events[i] = [startTimei, endTimei, valuei]. The ith event starts at
 * startTimei and ends at endTimei, and if you attend this event, you will
 * receive a value of valuei. You can choose at most two non-overlapping
 * events to attend such that the sum of their values is maximized.
 *
 * Return this maximum sum.
 *
 * Note that the start time and end time is inclusive: that is, you cannot
 * attend two events where one of them starts and the other ends at the
 * same time. More specifically, if you attend an event with end time t,
 * the next event must start at or after t + 1.
 */

/**
 * @param {number[][]} events
 * @return {number}
 */

```

2055 Plates Between Candles

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2055. Plates Between Candles
 * https://leetcode.com/problems/plates-between-candles/
 * Difficulty: Medium
 *
 * There is a long table with a line of plates and candles arranged on top of it. You are
given
 * a 0-indexed string s consisting of characters '*' and '|' only, where a '*' represents a
plate
 * and a '|' represents a candle.
 *
 * You are also given a 0-indexed 2D integer array queries where queries[i] = [lefti, righti]
 * denotes the substring s[lefti...righti] (inclusive). For each query, you need to find the
 * number of plates between candles that are in the substring. A plate is considered between
 * candles if there is at least one candle to its left and at least one candle to its right
 * in the substring.
 * - For example, s = "||**||**|*", and a query [3, 8] denotes the substring "*||**|". The
number
 *   of plates between candles in this substring is 2, as each of the two plates has at least
one
 *   candle in the substring to its left and right.
 *
 * Return an integer array answer where answer[i] is the answer to the ith query.
 */

/**
 * @param {string} s
 * @param {number[][]} queries
 * @return {number[]}
 */

    }
  }

  return result;
};
```

2056 Number Of Valid Move Combinations On Chessboard

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2056. Number of Valid Move Combinations On Chessboard
 * https://leetcode.com/problems/number-of-valid-move-combinations-on-chessboard/
 * Difficulty: Hard
 *
 * There is an 8 x 8 chessboard containing n pieces (rooks, queens, or bishops). You are given
 a
 * string array pieces of length n, where pieces[i] describes the type (rook, queen, or
bishop)
 * of the ith piece. In addition, you are given a 2D integer array positions also of length n,
 * where positions[i] = [ri, ci] indicates that the ith piece is currently at the 1-based
 * coordinate (ri, ci) on the chessboard.
 *
 * When making a move for a piece, you choose a destination square that the piece will travel
 * toward and stop on.
 * - A rook can only travel horizontally or vertically from (r, c) to the direction of (r+1,
c),
 *   (r-1, c), (r, c+1), or (r, c-1).
 * - A queen can only travel horizontally, vertically, or diagonally from (r, c) to the
direction
 *   of (r+1, c), (r-1, c), (r, c+1), (r, c-1), (r+1, c+1), (r+1, c-1), (r-1, c+1), (r-1,
c-1).
 * - A bishop can only travel diagonally from (r, c) to the direction of (r+1, c+1), (r+1,
c-1),
 *   (r-1, c+1), (r-1, c-1).
 *
 * You must make a move for every piece on the board simultaneously. A move combination
consists of
 * all the moves performed on all the given pieces. Every second, each piece will
instantaneously
 * travel one square towards their destination if they are not already at it. All pieces start
 * traveling at the 0th second. A move combination is invalid if, at a given time, two or more
 * pieces occupy the same square.
 *
 * Return the number of valid move combinations.
 *
 * Notes:
```

```
 * - No two pieces will start in the same square.
 * - You may choose the square a piece is already on as its destination.
 * - If two pieces are directly adjacent to each other, it is valid for them to move past each
 other
 *   and swap positions in one second.
 */

2060 Check If An Original String Exists Given Two Encoded Strings

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2060. Check if an Original String Exists Given Two Encoded Strings
 * https://leetcode.com/problems/check-if-an-original-string-exists-given-two-encoded-strings/
 * Difficulty: Hard
 *
 * An original string, consisting of lowercase English letters, can be encoded by the
following
 * steps:
 * - Arbitrarily split it into a sequence of some number of non-empty substrings.
 * - Arbitrarily choose some elements (possibly none) of the sequence, and replace each with
its
 *   length (as a numeric string).
 * - Concatenate the sequence as the encoded string.
 *
 * For example, one way to encode an original string "abcdefghijklmnop" might be:
 * - Split it as a sequence: ["ab", "cdefghijklmn", "o", "p"].
 * - Choose the second and third elements to be replaced by their lengths, respectively. The
 *   sequence becomes ["ab", "12", "1", "p"].
 * - Concatenate the elements of the sequence to get the encoded string: "ab121p".
 *
 * Given two encoded strings s1 and s2, consisting of lowercase English letters and digits 1-9
 * (inclusive), return true if there exists an original string that could be encoded as both
s1
 * and s2. Otherwise, return false.
 *
 * Note: The test cases are generated such that the number of consecutive digits in s1 and s2
 * does not exceed 3.
 */

/**
```

```
 * @param {string} s1
 * @param {string} s2
 * @return {boolean}
 */

    }
  }

  return total;
};
```

2064 Minimized Maximum Of Products Distributed To Any Store

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2064. Minimized Maximum of Products Distributed to Any Store
 * https://leetcode.com/problems/minimized-maximum-of-products-distributed-to-any-store/
 * Difficulty: Medium
 *
 * You are given an integer n indicating there are n specialty retail stores. There are m
product
 * types of varying amounts, which are given as a 0-indexed integer array quantities, where
 * quantities[i] represents the number of products of the ith product type.
 *
 * You need to distribute all products to the retail stores following these rules:
 * - A store can only be given at most one product type but can be given any amount of it.
 * - After distribution, each store will have been given some number of products (possibly 0).
 *   Let x represent the maximum number of products given to any store. You want x to be as
small
 *   as possible, i.e., you want to minimize the maximum number of products that are given to
any
 *   store.
 *
 * Return the minimum possible x.
 */
```

```
/**
 * @param {number} n
 * @param {number[]} quantities
 * @return {number}
 */

    let storesNeeded = 0;

    for (const quantity of quantities) {
      storesNeeded += Math.ceil(quantity / mid);
    }

    if (storesNeeded <= n) {
      right = mid;
    } else {
      left = mid + 1;
    }
  }

  return left;
};
```

2065 Maximum Path Quality Of A Graph

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2065. Maximum Path Quality of a Graph
 * https://leetcode.com/problems/maximum-path-quality-of-a-graph/
 * Difficulty: Hard
 *
 * There is an undirected graph with n nodes numbered from 0 to n - 1 (inclusive). You are
given a
 * 0-indexed integer array values where values[i] is the value of the ith node. You are also
given
 * a 0-indexed 2D integer array edges, where each edges[j] = [uj, vj, timej] indicates that
there
 * is an undirected edge between the nodes uj and vj, and it takes timej seconds to travel
between
 * the two nodes. Finally, you are given an integer maxTime.
 *
 * A valid path in the graph is any path that starts at node 0, ends at node 0, and takes at
most
 * maxTime seconds to complete. You may visit the same node multiple times. The quality of a
valid
 * path is the sum of the values of the unique nodes visited in the path (each node's value is
 * added at most once to the sum).
 *
 * Return the maximum quality of a valid path.
 *
 * Note: There are at most four edges connected to each node.
 */

/**
 * @param {number[]} values
 * @param {number[][]} edges
 * @param {number} maxTime
 * @return {number}

```

2069 Walking Robot Simulation Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```javascript
/**
 * 2069. Walking Robot Simulation II
 * https://leetcode.com/problems/walking-robot-simulation-ii/
 * Difficulty: Medium
 *
 * A width x height grid is on an XY-plane with the bottom-left cell at (0, 0) and the
 * top-right cell at (width - 1, height - 1). The grid is aligned with the four cardinal
 * directions ("North", "East", "South", and "West"). A robot is initially at cell (0, 0)
 * facing direction "East".
 *
 * The robot can be instructed to move for a specific number of steps. For each step, it does
 * the following.
 * 1. Attempts to move forward one cell in the direction it is facing.
 * 2. If the cell the robot is moving to is out of bounds, the robot instead turns 90 degrees
 *    counterclockwise and retries the step.
 *
 * After the robot finishes moving the number of steps required, it stops and awaits the next
 * instruction.
 *
 * Implement the Robot class:
 * - Robot(int width, int height) Initializes the width x height grid with the robot at (0, 0)
 *   facing "East".
 * - void step(int num) Instructs the robot to move forward num steps.
 * - int[] getPos() Returns the current cell the robot is at, as an array of length 2, [x, y].
 * - String getDir() Returns the current direction of the robot, "North", "East", "South", or
 *   "West".
 */

/**

2075 Decode The Slanted Ciphertext

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2075. Decode the Slanted Ciphertext
 * https://leetcode.com/problems/decode-the-slanted-ciphertext/
 * Difficulty: Medium
 *
 * A string originalText is encoded using a slanted transposition cipher to a string
encodedText
 * with the help of a matrix having a fixed number of rows rows.
 *
 * originalText is placed first in a top-left to bottom-right manner.
 *
 * The blue cells are filled first, followed by the red cells, then the yellow cells, and so
on,
 * until we reach the end of originalText. The arrow indicates the order in which the cells
are
 * filled. All empty cells are filled with ' '. The number of columns is chosen such that the
 * rightmost column will not be empty after filling in originalText.
 *
 * encodedText is then formed by appending all characters of the matrix in a row-wise fashion.
 *
 * The characters in the blue cells are appended first to encodedText, then the red cells, and
 so
 * on, and finally the yellow cells. The arrow indicates the order in which the cells are
accessed.
 *
 * For example, if originalText = "cipher" and rows = 3, then we encode it in the following
manner.
 *
 * The blue arrows depict how originalText is placed in the matrix, and the red arrows denote
the
 * order in which encodedText is formed. In the above example, encodedText = "ch ie pr".
 *
 * Given the encoded string encodedText and number of rows rows, return the original string
 * originalText.
 *
 * Note: originalText does not have any trailing spaces ' '. The test cases are generated such
 that
 * there is only one possible originalText.
 */

2076 Process Restricted Friend Requests

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2076. Process Restricted Friend Requests
 * https://leetcode.com/problems/process-restricted-friend-requests/
 * Difficulty: Hard
 *
 * You are given an integer n indicating the number of people in a network. Each person is
 * labeled from 0 to n - 1.
 *
 * You are also given a 0-indexed 2D integer array restrictions, where restrictions[i] = [xi,
yi]
 * means that person xi and person yi cannot become friends, either directly or indirectly
through
 * other people.
 *
 * Initially, no one is friends with each other. You are given a list of friend requests as a
 * 0-indexed 2D integer array requests, where requests[j] = [uj, vj] is a friend request
between
 * person uj and person vj.
 *
 * A friend request is successful if uj and vj can be friends. Each friend request is
processed
 * in the given order (i.e., requests[j] occurs before requests[j + 1]), and upon a successful
 * request, uj and vj become direct friends for all future friend requests.
 *
 * Return a boolean array result, where each result[j] is true if the jth friend request is
 * successful or false if it is not.
 *
 * Note: If uj and vj are already direct friends, the request is still successful.
 */

/**
 * @param {number} n
 * @param {number[][]} restrictions
 * @param {number[][]} requests
 * @return {boolean[]}

```

2079 Watering Plants

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2079. Watering Plants
 * https://leetcode.com/problems/watering-plants/
 * Difficulty: Medium
 *
 * You want to water n plants in your garden with a watering can. The plants are arranged in
 * a row and are labeled from 0 to n - 1 from left to right where the ith plant is located at
 * x = i. There is a river at x = -1 that you can refill your watering can at.
 *
 * Each plant needs a specific amount of water. You will water the plants in the following
way:
 * - Water the plants in order from left to right.
 * - After watering the current plant, if you do not have enough water to completely water the
 *   next plant, return to the river to fully refill the watering can.
 * - You cannot refill the watering can early.
 *
 * You are initially at the river (i.e., x = -1). It takes one step to move one unit on the
x-axis.
 *
 * Given a 0-indexed integer array plants of n integers, where plants[i] is the amount of
water
 * the ith plant needs, and an integer capacity representing the watering can capacity, return
 * the number of steps needed to water all the plants.
 */
```

```
/**
 * @param {number[]} plants

2088 Count Fertile Pyramids In A Land

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2088. Count Fertile Pyramids in a Land
 * https://leetcode.com/problems/count-fertile-pyramids-in-a-land/
 * Difficulty: Hard
 *
 * A farmer has a rectangular grid of land with m rows and n columns that can be divided into
 * unit cells. Each cell is either fertile (represented by a 1) or barren (represented by a
0).
 * All cells outside the grid are considered barren.
 *
 * A pyramidal plot of land can be defined as a set of cells with the following criteria:
 * 1. The number of cells in the set has to be greater than 1 and all cells must be fertile.
 * 2. The apex of a pyramid is the topmost cell of the pyramid. The height of a pyramid is the
 *    number of rows it covers. Let (r, c) be the apex of the pyramid, and its height be h.
 *    Then, the plot comprises of cells (i, j) where r <= i <= r + h - 1 and
 *    c - (i - r) <= j <= c + (i - r).
 *
 * An inverse pyramidal plot of land can be defined as a set of cells with similar criteria:
 * 1. The number of cells in the set has to be greater than 1 and all cells must be fertile.
 * 2. The apex of an inverse pyramid is the bottommost cell of the inverse pyramid. The height
 *    of an inverse pyramid is the number of rows it covers. Let (r, c) be the apex of the
 *    pyramid, and its height be h. Then, the plot comprises of cells (i, j) where
 *    r - h + 1 <= i <= r and c - (r - i) <= j <= c + (r - i).
 *
 * Some examples of valid and invalid pyramidal (and inverse pyramidal) plots are shown below.
 * Black cells indicate fertile cells.
```

```
 *
 * Given a 0-indexed m x n binary matrix grid representing the farmland, return the total
number
 * of pyramidal and inverse pyramidal plots that can be found in grid.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */

2089 Find Target Indices After Sorting Array

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2089. Find Target Indices After Sorting Array
 * https://leetcode.com/problems/find-target-indices-after-sorting-array/
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums and a target element target.
 *
 * A target index is an index i such that nums[i] == target.
 *
 * Return a list of the target indices of nums after sorting nums in non-decreasing order.
 * If there are no target indices, return an empty list. The returned list must be sorted
 * in increasing order.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number[]}
```

```
 */
var targetIndices = function(nums, target) {
  const result = [];

  nums.sort((a, b) => a - b);

  for (let i = 0; i < nums.length; i++) {
    if (nums[i] === target) {
      result.push(i);
    }
  }

  return result;
};
```

2090 K Radius Subarray Averages

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2090. K Radius Subarray Averages
 * https://leetcode.com/problems/k-radius-subarray-averages/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array nums of n integers, and an integer k.
 *
 * The k-radius average for a subarray of nums centered at some index i with the radius k is
 * the average of all elements in nums between the indices i - k and i + k (inclusive). If
 * there are less than k elements before or after the index i, then the k-radius average is
-1.
 *
 * Build and return an array avgs of length n where avgs[i] is the k-radius average for the
 * subarray centered at index i.
 *
 * The average of x elements is the sum of the x elements divided by x, using integer
division.
 * The integer division truncates toward zero, which means losing its fractional part.
 * - For example, the average of four elements 2, 3, 1, and
 *   5 is (2 + 3 + 1 + 5) / 4 = 11 / 4 = 2.75, which truncates to 2.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number[]}
 */
var getAverages = function(nums, k) {
  const n = nums.length;
  const windowSize = 2 * k + 1;
  const result = new Array(n).fill(-1);

  if (windowSize > n) return result;

  let sum = 0;
  for (let i = 0; i < windowSize; i++) {
    sum += nums[i];
  }

  result[k] = Math.floor(sum / windowSize);

  for (let i = k + 1; i < n - k; i++) {
    sum = sum - nums[i - k - 1] + nums[i + k];
    result[i] = Math.floor(sum / windowSize);
  }

  return result;
};
```

2091 Removing Minimum And Maximum From Array

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2091. Removing Minimum and Maximum From Array
 * https://leetcode.com/problems/removing-minimum-and-maximum-from-array/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array of distinct integers nums.
 *
 * There is an element in nums that has the lowest value and an element that has the highest
 * value. We call them the minimum and maximum respectively. Your goal is to remove both these
 * elements from the array.
 *
 * A deletion is defined as either removing an element from the front of the array or removing
 * an element from the back of the array.
 *
 * Return the minimum number of deletions it would take to remove both the minimum and maximum
 * element from the array.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var minimumDeletions = function(nums) {
  const n = nums.length;
  let minIndex = 0;
  let maxIndex = 0;

  for (let i = 1; i < n; i++) {
    if (nums[i] < nums[minIndex]) minIndex = i;
    if (nums[i] > nums[maxIndex]) maxIndex = i;
  }

  const left = Math.min(minIndex, maxIndex);
  const right = Math.max(minIndex, maxIndex);

  return Math.min(
    right + 1,
    n - left,
    left + 1 + n - right
  );
};
```

2092 Find All People With Secret

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2092. Find All People With Secret
 * https://leetcode.com/problems/find-all-people-with-secret/
 * Difficulty: Hard
 *
 * You are given an integer n indicating there are n people numbered from 0 to n - 1. You are
also
 * given a 0-indexed 2D integer array meetings where meetings[i] = [xi, yi, timei] indicates
that
 * person xi and person yi have a meeting at timei. A person may attend multiple meetings at
the
 * same time. Finally, you are given an integer firstPerson.
 *
```

```
 * Person 0 has a secret and initially shares the secret with a person firstPerson at time 0.
This
 * secret is then shared every time a meeting takes place with a person that has the secret.
More
 * formally, for every meeting, if a person xi has the secret at timei, then they will share
the
 * secret with person yi, and vice versa.
 *
 * The secrets are shared instantaneously. That is, a person may receive the secret and share
it
 * with people in other meetings within the same time frame.
 *
 * Return a list of all the people that have the secret after all the meetings have taken
place.
 * You may return the answer in any order.
 */

/**
 * @param {number} n
 * @param {number[][]} meetings
 * @param {number} firstPerson
 * @return {number[]}
 */
var findAllPeople = function(n, meetings, firstPerson) {

      }
    }
    return count;
  }
};
```

2102 Sequentially Ordinal Rank Tracker

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2102. Sequentially Ordinal Rank Tracker
 * https://leetcode.com/problems/sequentially-ordinal-rank-tracker/
 * Difficulty: Hard
 *
 * A scenic location is represented by its name and attractiveness score, where name is a
unique
 * string among all locations and score is an integer. Locations can be ranked from the best
to
 * the worst. The higher the score, the better the location. If the scores of two locations
are
 * equal, then the location with the lexicographically smaller name is better.
 *
 * You are building a system that tracks the ranking of locations with the system initially
 * starting with no locations. It supports:
 * - Adding scenic locations, one at a time.
 * - Querying the ith best location of all locations already added, where i is the number of
 *   times the system has been queried (including the current query).
 *   - For example, when the system is queried for the 4th time, it returns the 4th best
location
 *     of all locations already added.
 *
 * Note that the test data are generated so that at any time, the number of queries does not
 * exceed the number of locations added to the system.
 *
 * Implement the SORTracker class:
 * - SORTracker() Initializes the tracker system.
 * - void add(string name, int score) Adds a scenic location with name and score to the
system.
```

```
 * - string get() Queries and returns the ith best location, where i is the number of times
this
 *   method has been invoked (including this invocation).
 */

var SORTracker = function() {
  this.count = 0;
  this.minHeap = new PriorityQueue((a, b) => a[0] - b[0] || b[1].localeCompare(a[1]));
  this.maxHeap = new PriorityQueue((a, b) => b[0] - a[0] || a[1].localeCompare(b[1]));
};

/**
 * @param {string} name
 * @param {number} score
 * @return {void}
 */
SORTracker.prototype.add = function(name, score) {
  this.minHeap.enqueue([score, name]);
  this.maxHeap.enqueue(this.minHeap.dequeue());
};

/**
 * @return {string}
 */
SORTracker.prototype.get = function() {
  const maxElement = this.maxHeap.dequeue();
  this.minHeap.enqueue(maxElement);

  return maxElement[1];
};
```

2103 Rings And Rods

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2103. Rings and Rods
 * https://leetcode.com/problems/rings-and-rods/
 * Difficulty: Easy
 *
 * There are n rings and each ring is either red, green, or blue. The rings are distributed
across
 * ten rods labeled from 0 to 9.
 *
 * You are given a string rings of length 2n that describes the n rings that are placed onto
the
 * rods. Every two characters in rings forms a color-position pair that is used to describe
each
 * ring where:
 * - The first character of the ith pair denotes the ith ring's color ('R', 'G', 'B').
 * - The second character of the ith pair denotes the rod that the ith ring is placed on
 *   ('0' to '9').
 *
 * For example, "R3G2B1" describes n == 3 rings: a red ring placed onto the rod labeled 3, a
green
 * ring placed onto the rod labeled 2, and a blue ring placed onto the rod labeled 1.
 *
 * Return the number of rods that have all three colors of rings on them.
 */

/**
 * @param {string} rings
 * @return {number}
 */
var countPoints = function(rings) {
  const map = new Map();

  for (let i = 0; i < rings.length; i += 2) {
    const color = rings[i];
    const rod = rings[i + 1];
```

```
    if (!map.has(rod)) map.set(rod, new Set());
    map.get(rod).add(color);
  }

  let result = 0;
  for (const colors of map.values()) {
    if (colors.size === 3) result++;
  }

  return result;
};
```

2104 Sum Of Subarray Ranges

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2104. Sum of Subarray Ranges
 * https://leetcode.com/problems/sum-of-subarray-ranges/
 * Difficulty: Medium
 *
 * You are given an integer array nums. The range of a subarray of nums is the difference
between
 * the largest and smallest element in the subarray.
 *
 * Return the sum of all subarray ranges of nums.
 *
 * A subarray is a contiguous non-empty sequence of elements within an array.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var subArrayRanges = function(nums) {
  let result = 0;

  for (let i = 0; i < nums.length; i++) {
    let min = nums[i];
    let max = nums[i];

    for (let j = i; j < nums.length; j++) {
      min = Math.min(min, nums[j]);
      max = Math.max(max, nums[j]);
      result += max - min;
    }
  }

  return result;
};
```

2105 Watering Plants Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2105. Watering Plants II
 * https://leetcode.com/problems/watering-plants-ii/
 * Difficulty: Medium
 *
 * Alice and Bob want to water n plants in their garden. The plants are arranged in a row and
are
 * labeled from 0 to n - 1 from left to right where the ith plant is located at x = i.
 *
 * Each plant needs a specific amount of water. Alice and Bob have a watering can each,
```

```
initially
 * full. They water the plants in the following way:
 * - Alice waters the plants in order from left to right, starting from the 0th plant. Bob
waters
 *   the plants in order from right to left, starting from the (n - 1)th plant. They begin
watering
 *   the plants simultaneously.
 * - It takes the same amount of time to water each plant regardless of how much water it
needs.
 * - Alice/Bob must water the plant if they have enough in their can to fully water it.
Otherwise,
 *   they first refill their can (instantaneously) then water the plant.
 * - In case both Alice and Bob reach the same plant, the one with more water currently in
his/her
 *   watering can should water this plant. If they have the same amount of water, then Alice
should
 *   water this plant.
 *
 * Given a 0-indexed integer array plants of n integers, where plants[i] is the amount of
water the
 * ith plant needs, and two integers capacityA and capacityB representing the capacities of
Alice's
 * and Bob's watering cans respectively, return the number of times they have to refill to
water all
 * the plants.
 */

/**
 * @param {number[]} plants
 * @param {number} capacityA
 * @param {number} capacityB
 * @return {number}
 */
var minimumRefill = function(plants, capacityA, capacityB) {
  let result = 0;
  let left = 0;
  let right = plants.length - 1;

  while (left <= right) {
    if (left === right) {
      if (waterA >= waterB && waterA < plants[left]) result++;
      if (waterB > waterA && waterB < plants[right]) result++;
      break;
    }

    if (waterA < plants[left]) {
      waterA = capacityA;
      result++;
    }
    waterA -= plants[left++];

    if (waterB < plants[right]) {
      waterB = capacityB;
      result++;
    }
    waterB -= plants[right--];
  }

  return result;
};
```

2106 Maximum Fruits Harvested After At Most K Steps

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2106. Maximum Fruits Harvested After at Most K Steps
 * https://leetcode.com/problems/maximum-fruits-harvested-after-at-most-k-steps/
```

```
 * Difficulty: Hard
 *
 * Fruits are available at some positions on an infinite x-axis. You are given a 2D integer
array
 * fruits where fruits[i] = [positioni, amounti] depicts amounti fruits at the position
positioni.
 * fruits is already sorted by positioni in ascending order, and each positioni is unique.
 *
 * You are also given an integer startPos and an integer k. Initially, you are at the position
 * startPos. From any position, you can either walk to the left or right. It takes one step to
 * move one unit on the x-axis, and you can walk at most k steps in total. For every position
 * you reach, you harvest all the fruits at that position, and the fruits will disappear from
 * that position.
 *
 * Return the maximum total number of fruits you can harvest.
 */

/**
 * @param {number[][]} fruits
 * @param {number} startPos
 * @param {number} k
 * @return {number}
 */

    } else {
      currentLength = 1;
    }
    result += currentLength;
  }

  return result;
};
```

2111 Minimum Operations To Make The Array K Increasing

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2111. Minimum Operations to Make the Array K-Increasing
 * https://leetcode.com/problems/minimum-operations-to-make-the-array-k-increasing/
 * Difficulty: Hard
 *
 * You are given a 0-indexed array arr consisting of n positive integers, and a positive
integer k.
 *
 * The array arr is called K-increasing if arr[i-k] <= arr[i] holds for every index i, where
 * k <= i <= n-1.
 *
 * - For example, arr = [4, 1, 5, 2, 6, 2] is K-increasing for k = 2 because:
 *   - arr[0] <= arr[2] (4 <= 5)
 *   - arr[1] <= arr[3] (1 <= 2)
 *   - arr[2] <= arr[4] (5 <= 6)
 *   - arr[3] <= arr[5] (2 <= 2)
 * - However, the same arr is not K-increasing for k = 1 (because arr[0] > arr[1]) or k = 3
(because
 *   arr[0] > arr[3]).
 *
 * In one operation, you can choose an index i and change arr[i] into any positive integer.
 *
 * Return the minimum number of operations required to make the array K-increasing for the
given k.
 */

/**
 * @param {number[]} arr

        }
      }
      tails[left] = num;
    }
    return nums.length - tails.length;
  }
};
```

2113 Elements In Array After Removing And Replacing Elements

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2113. Elements in Array After Removing and Replacing Elements
 * https://leetcode.com/problems/elements-in-array-after-removing-and-replacing-elements/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums. Initially on minute 0, the array is
unchanged.
 * Every minute, the leftmost element in nums is removed until no elements remain. Then, every
 * minute, one element is appended to the end of nums, in the order they were removed in,
until
 * the original array is restored. This process repeats indefinitely.
 * - For example, the array [0,1,2] would change as follows: [0,1,2] → [1,2] → [2] → [] → [0]
→
 *   [0,1] → [0,1,2] → [1,2] → [2] → [] → [0] → [0,1] → [0,1,2] → ...
 *
 * You are also given a 2D integer array queries of size n where queries[j] = [timej, indexj].
 * The answer to the jth query is:
 * - nums[indexj] if indexj < nums.length at minute timej
 * - -1 if indexj >= nums.length at minute timej
 *
 * Return an integer array ans of size n where ans[j] is the answer to the jth query.
 */

/**
 * @param {number[]} nums
 * @param {number[][]} queries
 * @return {number[]}
 */

    }
  }

  return true;
};
```

2117 Abbreviating The Product Of A Range

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2117. Abbreviating the Product of a Range
 * https://leetcode.com/problems/abbreviating-the-product-of-a-range/
 * Difficulty: Hard
 *
 * You are given two positive integers left and right with left <= right. Calculate the
product of
 * all integers in the inclusive range [left, right].
 *
 * Since the product may be very large, you will abbreviate it following these steps:
 * 1. Count all trailing zeros in the product and remove them. Let us denote this count as C.
 *    - For example, there are 3 trailing zeros in 1000, and there are 0 trailing zeros in
546.
 * 2. Denote the remaining number of digits in the product as d. If d > 10, then express the
product
 *    as <pre>...<suf> where <pre> denotes the first 5 digits of the product, and <suf>
denotes the
 *    last 5 digits of the product after removing all trailing zeros. If d <= 10, we keep it
 *    unchanged.
 *    - For example, we express 1234567654321 as 12345...54321, but 1234567 is represented as
 *      1234567.
 * 3. Finally, represent the product as a string "<pre>...<suf>eC".
 *    - For example, 12345678987600000 will be represented as "12345...89876e5".
 *
 * Return a string denoting the abbreviated product of all integers in the inclusive range
[left,
 * right].

2119 A Number After A Double Reversal

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2119. A Number After a Double Reversal
 * https://leetcode.com/problems/a-number-after-a-double-reversal/
 * Difficulty: Easy
 *
 * Reversing an integer means to reverse all its digits.
 * - For example, reversing 2021 gives 1202. Reversing 12300 gives 321 as the leading zeros
 *   are not retained.
 *
 * Given an integer num, reverse num to get reversed1, then reverse reversed1 to get
reversed2.
 * Return true if reversed2 equals num. Otherwise return false.
 */
```

```
/**
 * @param {number} num
 * @return {boolean}
 */
var isSameAfterReversals = function(num) {
  return num === 0 || num % 10 !== 0;
};
```

2120 Execution Of All Suffix Instructions Staying In A Grid

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2120. Execution of All Suffix Instructions Staying in a Grid
 * https://leetcode.com/problems/execution-of-all-suffix-instructions-staying-in-a-grid/
 * Difficulty: Medium
 *
 * There is an n x n grid, with the top-left cell at (0, 0) and the bottom-right cell at
 * (n - 1, n - 1). You are given the integer n and an integer array startPos where
 * startPos = [startrow, startcol] indicates that a robot is initially at cell (startrow,
startcol).
 *
 * You are also given a 0-indexed string s of length m where s[i] is the ith instruction for
the
 * robot: 'L' (move left), 'R' (move right), 'U' (move up), and 'D' (move down).
 *
 * The robot can begin executing from any ith instruction in s. It executes the instructions
one
 * by one towards the end of s but it stops if either of these conditions is met:
 * - The next instruction will move the robot off the grid.
 * - There are no more instructions left to execute.
 *
 * Return an array answer of length m where answer[i] is the number of instructions the robot
can
 * execute if the robot begins executing from the ith instruction in s.
 */

/**
 * @param {number} n
 * @param {number[]} startPos
 * @param {string} s
 * @return {number[]}
 */
var executeInstructions = function(n, startPos, s) {
  const m = s.length;
  const result = new Array(m).fill(0);

      else row++;

      if (row < 0 || row >= n || col < 0 || col >= n) break;
      steps++;
    }

    result[i] = steps;
  }

  return result;
};
```

2121 Intervals Between Identical Elements

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2121. Intervals Between Identical Elements
 * https://leetcode.com/problems/intervals-between-identical-elements/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array of n integers arr.
 *
 * The interval between two elements in arr is defined as the absolute difference between
their
 * indices. More formally, the interval between arr[i] and arr[j] is |i - j|.
 *
 * Return an array intervals of length n where intervals[i] is the sum of intervals between
arr[i]
 * and each element in arr with the same value as arr[i].
 *
 * Note: |x| is the absolute value of x.
 */

/**
 * @param {number[]} arr
 * @return {number[]}
 */
var getDistances = function(arr) {
  const valueIndices = new Map();
  const result = new Array(arr.length).fill(0);

  for (let i = 0; i < arr.length; i++) {
    if (!valueIndices.has(arr[i])) {
      valueIndices.set(arr[i], []);
    }
    valueIndices.get(arr[i]).push(i);
  }

  for (const indices of valueIndices.values()) {
    let prefixSum = 0;
    for (let i = 1; i < indices.length; i++) {
      prefixSum += indices[i] - indices[0];
    }

    result[indices[0]] = prefixSum;

    for (let i = 1; i < indices.length; i++) {
      const diff = indices[i] - indices[i - 1];
      prefixSum += diff * (i - (indices.length - i));
      result[indices[i]] = prefixSum;
    }
  }

  return result;
};
```

2122 Recover The Original Array

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2122. Recover the Original Array
 * https://leetcode.com/problems/recover-the-original-array/
 * Difficulty: Hard
```

```
 *
 * Alice had a 0-indexed array arr consisting of n positive integers. She chose an arbitrary
 * positive integer k and created two new 0-indexed integer arrays lower and higher in the
 * following manner:
 * 1. lower[i] = arr[i] - k, for every index i where 0 <= i < n
 * 2. higher[i] = arr[i] + k, for every index i where 0 <= i < n
 *
 * Unfortunately, Alice lost all three arrays. However, she remembers the integers that were
 * present in the arrays lower and higher, but not the array each integer belonged to. Help
 * Alice and recover the original array.
 *
 * Given an array nums consisting of 2n integers, where exactly n of the integers were present
 * in lower and the remaining in higher, return the original array arr. In case the answer is
 * not unique, return any valid array.
 *
 * Note: The test cases are generated such that there exists at least one valid array arr.
 */

/**
 * @param {number[]} nums
 * @return {number[]}
 */
var recoverArray = function(nums) {
  const n = nums.length / 2;
  nums.sort((a, b) => a - b);

  for (let i = 1; i < 2 * n; i++) {
    const k = nums[i] - nums[0];
    if (k <= 0 || k % 2 !== 0) continue;

    const original = [];
    const used = new Array(2 * n).fill(false);
    let count = 0;

    result = Math.min(result, currentZeros);
  }
```

```
  return result;
};
```

2135 Count Words Obtained After Adding A Letter

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2135. Count Words Obtained After Adding a Letter
 * https://leetcode.com/problems/count-words-obtained-after-adding-a-letter/
 * Difficulty: Medium
 *
 * You are given two 0-indexed arrays of strings startWords and targetWords. Each string
consists
 * of lowercase English letters only.
 *
 * For each string in targetWords, check if it is possible to choose a string from startWords
and
 * perform a conversion operation on it to be equal to that from targetWords.
 *
 * The conversion operation is described in the following two steps:
 * 1. Append any lowercase letter that is not present in the string to its end.
 *    - For example, if the string is "abc", the letters 'd', 'e', or 'y' can be added to it,
but
 *      not 'a'. If 'd' is added, the resulting string will be "abcd".
 * 2. Rearrange the letters of the new string in any arbitrary order.
 *    - For example, "abcd" can be rearranged to "acbd", "bacd", "cbda", and so on. Note that
it
 *      can also be rearranged to "abcd" itself.
 *
 * Return the number of strings in targetWords that can be obtained by performing the
operations
 * on any string of startWords.
 *
 * Note that you will only be verifying if the string in targetWords can be obtained from a
string
 * in startWords by performing the operations. The strings in startWords do not actually
change
 * during this process.
 */

/**
 * @param {string[]} startWords
 * @param {string[]} targetWords
 * @return {number}
 */
var wordCount = function(startWords, targetWords) {
  const sortedStartWords = new Set(startWords.map(word => [...word].sort().join('')));

  for (const target of targetWords) {
    const sortedTarget = [...target].sort().join('');
    for (let i = 0; i < target.length; i++) {
      const candidate = sortedTarget.slice(0, i) + sortedTarget.slice(i + 1);
      if (sortedStartWords.has(candidate)) {
        result++;
        break;
      }
    }
  }

  return result;
};
```

2136 Earliest Possible Day Of Full Bloom

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2136. Earliest Possible Day of Full Bloom
 * https://leetcode.com/problems/earliest-possible-day-of-full-bloom/
 * Difficulty: Hard
 *
 * You have n flower seeds. Every seed must be planted first before it can begin to grow, then
 * bloom. Planting a seed takes time and so does the growth of a seed. You are given two
0-indexed
 * integer arrays plantTime and growTime, of length n each:
 * - plantTime[i] is the number of full days it takes you to plant the ith seed. Every day,
you can
 *   work on planting exactly one seed. You do not have to work on planting the same seed on
 *   consecutive days, but the planting of a seed is not complete until you have worked
plantTime[i]
 *   days on planting it in total.
 * - growTime[i] is the number of full days it takes the ith seed to grow after being
completely
 *   planted. After the last day of its growth, the flower blooms and stays bloomed forever.
 *
 * From the beginning of day 0, you can plant the seeds in any order.
 *
 * Return the earliest possible day where all seeds are blooming.
 */

/**
 * @param {number[]} plantTime
 * @param {number[]} growTime
 * @return {number}
 */
var earliestFullBloom = function(plantTime, growTime) {
  const seeds = plantTime.map((plant, index) => ({ plant, grow: growTime[index] }));
  seeds.sort((a, b) => b.grow - a.grow);

  let plantingDays = 0;
  let result = 0;

  for (const { plant, grow } of seeds) {
    plantingDays += plant;
    result = Math.max(result, plantingDays + grow);
  }

  return result;
};

2138 Divide A String Into Groups Of Size K

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2138. Divide a String Into Groups of Size k
 * https://leetcode.com/problems/divide-a-string-into-groups-of-size-k/
 * Difficulty: Easy
 *
 * A string s can be partitioned into groups of size k using the following procedure:
 * - The first group consists of the first k characters of the string, the second group
consists
 *   of the next k characters of the string, and so on. Each element can be a part of exactly
one
 *   group.
 * - For the last group, if the string does not have k characters remaining, a character fill
is
 *   used to complete the group.
 *
 * Note that the partition is done so that after removing the fill character from the last
group
 * (if it exists) and concatenating all the groups in order, the resultant string should be s.
 *
 * Given the string s, the size of each group k and the character fill, return a string array
 * denoting the composition of every group s has been divided into, using the above procedure.
```

```
 */

/**
 * @param {string} s
 * @param {number} k
 * @param {character} fill
 * @return {string[]}
 */

```

2140 Solving Questions With Brainpower

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2140. Solving Questions With Brainpower
 * https://leetcode.com/problems/solving-questions-with-brainpower/
 * Difficulty: Medium
 *
 * You are given a 0-indexed 2D integer array questions where questions[i] = [pointsi,
brainpoweri].
 *
 * The array describes the questions of an exam, where you have to process the questions in
order
 * (i.e., starting from question 0) and make a decision whether to solve or skip each
question.
 * Solving question i will earn you pointsi points but you will be unable to solve each of the
 next
 * brainpoweri questions. If you skip question i, you get to make the decision on the next
question.
 *
 * For example, given questions = [[3, 2], [4, 3], [4, 4], [2, 5]]:
 * - If question 0 is solved, you will earn 3 points but you will be unable to solve questions
 *   1 and 2.
 * - If instead, question 0 is skipped and question 1 is solved, you will earn 4 points but
you
 *   will be unable to solve questions 2 and 3.
 *
 * Return the maximum points you can earn for the exam.
 */

    const total = batteries.reduce((sum, battery) => sum + Math.min(battery, mid), 0);

    if (total >= n * mid) {
      left = mid;
    } else {
      right = mid - 1;
    }
  }

  return left;
};
```

2143 Choose Numbers From Two Arrays In Range

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2143. Choose Numbers From Two Arrays in Range
 * https://leetcode.com/problems/choose-numbers-from-two-arrays-in-range/
 * Difficulty: Hard
 *
 * You are given two 0-indexed integer arrays nums1 and nums2 of length n.
 *
 * A range [l, r] (inclusive) where 0 <= l <= r < n is balanced if:
 * - For every i in the range [l, r], you pick either nums1[i] or nums2[i].
 * - The sum of the numbers you pick from nums1 equals to the sum of the numbers you pick from
 *   nums2 (the sum is considered to be 0 if you pick no numbers from an array).
 *
 * Two balanced ranges from [l1, r1] and [l2, r2] are considered to be different if at least
 * one of the following is true:
 * - l1 != l2
 * - r1 != r2
 * - nums1[i] is picked in the first range, and nums2[i] is picked in the second range or vice
 *   versa for at least one i.
 *
 * Return the number of different ranges that are balanced. Since the answer may be very
large,
 * return it modulo 109 + 7.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number}
 */

2145 Count The Hidden Sequences

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2145. Count the Hidden Sequences
```

```
 * https://leetcode.com/problems/count-the-hidden-sequences/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array of n integers differences, which describes the differences
 * between each pair of consecutive integers of a hidden sequence of length (n + 1). More
formally,
 * call the hidden sequence hidden, then we have that differences[i] = hidden[i + 1] -
hidden[i].
 *
 * You are further given two integers lower and upper that describe the inclusive range of
values
 * [lower, upper] that the hidden sequence can contain.
 *
 * - For example, given differences = [1, -3, 4], lower = 1, upper = 6, the hidden sequence is
 a
 *   sequence of length 4 whose elements are in between 1 and 6 (inclusive).
 *   - [3, 4, 1, 5] and [4, 5, 2, 6] are possible hidden sequences.
 *   - [5, 6, 3, 7] is not possible since it contains an element greater than 6.
 *   - [1, 2, 3, 4] is not possible since the differences are not correct.
 *
 * Return the number of possible hidden sequences there are. If there are no possible
sequences,
 * return 0.
 */

/**
 * @param {number[]} differences
 * @param {number} lower
 * @param {number} upper
 * @return {number}
 */

    maxValue = Math.max(maxValue, current);
  }

  const range = upper - lower;
  const validRange = range - (maxValue - minValue);

  return validRange >= 0 ? validRange + 1 : 0;
};
```

2146 K Highest Ranked Items Within A Price Range

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2146. K Highest Ranked Items Within a Price Range
 * https://leetcode.com/problems/k-highest-ranked-items-within-a-price-range/
 * Difficulty: Medium
 *
 * You are given a 0-indexed 2D integer array grid of size m x n that represents a map of the
 * items in a shop. The integers in the grid represent the following:
 * - 0 represents a wall that you cannot pass through.
 * - 1 represents an empty cell that you can freely move to and from.
 *
 * All other positive integers represent the price of an item in that cell. You may also
freely
 * move to and from these item cells.
 *
 * It takes 1 step to travel between adjacent grid cells.
 *
 * You are also given integer arrays pricing and start where pricing = [low, high] and
```

```
 * start = [row, col] indicates that you start at the position (row, col) and are interested
 * only in items with a price in the range of [low, high] (inclusive). You are further given
 * an integer k.
 *
 * You are interested in the positions of the k highest-ranked items whose prices are within
 * the given price range. The rank is determined by the first of these criteria that is
different:
 * 1. Distance, defined as the length of the shortest path from the start (shorter distance
has
 *    a higher rank).
 * 2. Price (lower price has a higher rank, but it must be in the price range).
 * 3. The row number (smaller row number has a higher rank).
 * 4. The column number (smaller column number has a higher rank).
 *
 * Return the k highest-ranked items within the price range sorted by their rank (highest to
 * lowest). If there are fewer than k reachable items within the price range, return all of
them.
 */

/**

2147 Number Of Ways To Divide A Long Corridor

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2147. Number of Ways to Divide a Long Corridor
 * https://leetcode.com/problems/number-of-ways-to-divide-a-long-corridor/
 * Difficulty: Hard
 *
 * Along a long library corridor, there is a line of seats and decorative plants. You are
given
 * a 0-indexed string corridor of length n consisting of letters 'S' and 'P' where each 'S'
 * represents a seat and each 'P' represents a plant.
 *
 * One room divider has already been installed to the left of index 0, and another to the
right
 * of index n - 1. Additional room dividers can be installed. For each position between
indices
 * i - 1 and i (1 <= i <= n - 1), at most one divider can be installed.
 *
 * Divide the corridor into non-overlapping sections, where each section has exactly two seats
 * with any number of plants. There may be multiple ways to perform the division. Two ways are
 * different if there is a position with a room divider installed in the first way but not in
 * the second way.
 *
 * Return the number of ways to divide the corridor. Since the answer may be very large,
return
 * it modulo 109 + 7. If there is no way, return 0.
 */

/**
 * @param {string} corridor
 * @return {number}
 */

2157 Groups Of Strings

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2157. Groups of Strings
 * https://leetcode.com/problems/groups-of-strings/
 * Difficulty: Hard
 *
 * You are given a 0-indexed array of strings words. Each string consists of lowercase English
 * letters only. No letter occurs more than once in any string of words.
 *
 * Two strings s1 and s2 are said to be connected if the set of letters of s2 can be obtained
 * from the set of letters of s1 by any one of the following operations:
 * - Adding exactly one letter to the set of the letters of s1.
 * - Deleting exactly one letter from the set of the letters of s1.
 * - Replacing exactly one letter from the set of the letters of s1 with any letter, including
 *   itself.
 *
 * The array words can be divided into one or more non-intersecting groups. A string belongs
 * to a group if any one of the following is true:
 * - It is connected to at least one other string of the group.
 * - It is the only string present in the group.
 *
 * Note that the strings in words should be grouped in such a manner that a string belonging
 * to a group cannot be connected to a string present in any other group. It can be proved
 * that such an arrangement is always unique.
```

```
 *
 * Return an array ans of size 2 where:
 * - ans[0] is the maximum number of groups words can be divided into, and
 * - ans[1] is the size of the largest group.

    ...nums.filter(x => x === pivot),
    ...nums.filter(x => x > pivot),
  ];
};
```

2162 Minimum Cost To Set Cooking Time

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2162. Minimum Cost to Set Cooking Time
 * https://leetcode.com/problems/minimum-cost-to-set-cooking-time/
 * Difficulty: Medium
 *
 * A generic microwave supports cooking times for:
 * - at least 1 second.
 * - at most 99 minutes and 99 seconds.
 *
 * To set the cooking time, you push at most four digits. The microwave normalizes what you
push
 * as four digits by prepending zeroes. It interprets the first two digits as the minutes and
 * the last two digits as the seconds. It then adds them up as the cooking time. For example,
 * - You push 9 5 4 (three digits). It is normalized as 0954 and interpreted as 9 minutes and
 *   54 seconds.
 * - You push 0 0 0 8 (four digits). It is interpreted as 0 minutes and 8 seconds.
 * - You push 8 0 9 0. It is interpreted as 80 minutes and 90 seconds.
 * - You push 8 1 3 0. It is interpreted as 81 minutes and 30 seconds.
 *
 * You are given integers startAt, moveCost, pushCost, and targetSeconds. Initially, your
finger
 * is on the digit startAt. Moving the finger above any specific digit costs moveCost units of
 * fatigue. Pushing the digit below the finger once costs pushCost units of fatigue.
```

```
 *
 * There can be multiple ways to set the microwave to cook for targetSeconds seconds but you
are
 * interested in the way with the minimum cost.
 *
 * Return the minimum cost to set targetSeconds seconds of cooking time.
 *
 * Remember that one minute consists of 60 seconds.
 */

2163 Minimum Difference In Sums After Removal Of Elements

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2163. Minimum Difference in Sums After Removal of Elements
 * https://leetcode.com/problems/minimum-difference-in-sums-after-removal-of-elements/
 * Difficulty: Hard
 *
 * You are given a 0-indexed integer array nums consisting of 3 * n elements.
 *
 * You are allowed to remove any subsequence of elements of size exactly n from nums.
 * The remaining 2 * n elements will be divided into two equal parts:
 * - The first n elements belonging to the first part and their sum is sumfirst.
 * - The next n elements belonging to the second part and their sum is sumsecond.
 *
 * The difference in sums of the two parts is denoted as sumfirst - sumsecond.
 * - For example, if sumfirst = 3 and sumsecond = 2, their difference is 1.
 * - Similarly, if sumfirst = 2 and sumsecond = 3, their difference is -1.
 *
 * Return the minimum difference possible between the sums of the two parts after the removal
 * of n elements.
 */

```

2166 Design Bitset

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2166. Design Bitset
 * https://leetcode.com/problems/design-bitset/
 * Difficulty: Medium
 *
 * A Bitset is a data structure that compactly stores bits.
 *
 * Implement the Bitset class:
 * - Bitset(int size) Initializes the Bitset with size bits, all of which are 0.
 * - void fix(int idx) Updates the value of the bit at the index idx to 1. If the value was
 *   already 1, no change occurs.
 * - void unfix(int idx) Updates the value of the bit at the index idx to 0. If the value
 *   was already 0, no change occurs.
 * - void flip() Flips the values of each bit in the Bitset. In other words, all bits with
 *   value 0 will now have value 1 and vice versa.
 * - boolean all() Checks if the value of each bit in the Bitset is 1. Returns true if it
 *   satisfies the condition, false otherwise.
 * - boolean one() Checks if there is at least one bit in the Bitset with value 1. Returns
 *   true if it satisfies the condition, false otherwise.
 * - int count() Returns the total number of bits in the Bitset which have value 1.
 * - String toString() Returns the current composition of the Bitset. Note that in the
 *   resultant string, the character at the ith index should coincide with the value at
 *   the ith bit of the Bitset.
 */

2178 Maximum Split Of Positive Even Integers

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2178. Maximum Split of Positive Even Integers
 * https://leetcode.com/problems/maximum-split-of-positive-even-integers/
 * Difficulty: Medium
 *
 * You are given an integer finalSum. Split it into a sum of a maximum number of unique
 * positive even integers.
 * - For example, given finalSum = 12, the following splits are valid (unique positive even
 *   integers summing up to finalSum): (12), (2 + 10), (2 + 4 + 6), and (4 + 8). Among them,
 *   (2 + 4 + 6) contains the maximum number of integers. Note that finalSum cannot be split
 *   into (2 + 2 + 4 + 4) as all the numbers should be unique.
 *
 * Return a list of integers that represent a valid split containing a maximum number of
 * integers. If no valid split exists for finalSum, return an empty list. You may return
 * the integers in any order.
 */

/**
 * @param {number} finalSum
 * @return {number[]}
 */
var maximumEvenSplit = function(finalSum) {
  if (finalSum % 2 !== 0) return [];

      result.push(remaining);
      return result;
    }
    result.push(current);
    remaining -= current;
    current += 2;
  }

  return result;
};
```

2179 Count Good Triplets In An Array

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2179. Count Good Triplets in an Array
 * https://leetcode.com/problems/count-good-triplets-in-an-array/
 * Difficulty: Hard
```

```
 *
 * You are given two 0-indexed arrays nums1 and nums2 of length n, both of which are
permutations
 * of [0, 1, ..., n - 1].
 *
 * A good triplet is a set of 3 distinct values which are present in increasing order by
position
 * both in nums1 and nums2. In other words, if we consider pos1v as the index of the value v
in
 * nums1 and pos2v as the index of the value v in nums2, then a good triplet will be a set (x,
 y, z)
 * where 0 <= x, y, z <= n - 1, such that pos1x < pos1y < pos1z and pos2x < pos2y < pos2z.
 *
 * Return the total number of good triplets.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2

2197 Replace Non Coprime Numbers In Array

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2197. Replace Non-Coprime Numbers in Array
 * https://leetcode.com/problems/replace-non-coprime-numbers-in-array/
 * Difficulty: Hard
 *
 * You are given an array of integers nums. Perform the following steps:
 * 1. Find any two adjacent numbers in nums that are non-coprime.
 * 2. If no such numbers are found, stop the process.
 * 3. Otherwise, delete the two numbers and replace them with their LCM (Least Common
Multiple).
 * 4. Repeat this process as long as you keep finding two adjacent non-coprime numbers.
 *
 * Return the final modified array. It can be shown that replacing adjacent non-coprime
numbers in
 * any arbitrary order will lead to the same result.
 *
 * The test cases are generated such that the values in the final array are less than or equal
 to
 * 108.
 *
 * Two values x and y are non-coprime if GCD(x, y) > 1 where GCD(x, y) is the Greatest Common
 * Divisor of x and y.
 */

    const largest = pq.dequeue();
    const halved = largest / 2;
    reducedSum += halved;
    pq.enqueue(halved);
    result++;
  }

  return result;
};
```

2209 Minimum White Tiles After Covering With Carpets

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2209. Minimum White Tiles After Covering With Carpets
 * https://leetcode.com/problems/minimum-white-tiles-after-covering-with-carpets/
 * Difficulty: Hard
 *
 * You are given a 0-indexed binary string floor, which represents the colors of tiles on a
floor:
 * - floor[i] = '0' denotes that the ith tile of the floor is colored black.
 * - On the other hand, floor[i] = '1' denotes that the ith tile of the floor is colored
white.
 *
 * You are also given numCarpets and carpetLen. You have numCarpets black carpets, each of
length
 * carpetLen tiles. Cover the tiles with the given carpets such that the number of white tiles
 * still visible is minimum. Carpets may overlap one another.
 *
 * Return the minimum number of white tiles still visible.
 */

/**
 * @param {string} floor
 * @param {number} numCarpets
 * @param {number} carpetLen
 * @return {number}
 */
var minimumWhiteTiles = function(floor, numCarpets, carpetLen) {
  const n = floor.length;
  const dp = Array.from({ length: n + 1 }, () => Array(numCarpets + 1).fill(0));

    }

    prev = nums[i];
  }

  return count;
};
```

2211 Count Collisions On A Road

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2211. Count Collisions on a Road
 * https://leetcode.com/problems/count-collisions-on-a-road/
 * Difficulty: Medium
 *
 * There are n cars on an infinitely long road. The cars are numbered from 0 to n - 1 from
left
 * to right and each car is present at a unique point.
 *
 * You are given a 0-indexed string directions of length n. directions[i] can be either 'L',
'R',
 * or 'S' denoting whether the ith car is moving towards the left, towards the right, or
staying
 * at its current point respectively. Each moving car has the same speed.
 *
```

```
 * The number of collisions can be calculated as follows:
 * - When two cars moving in opposite directions collide with each other, the number of
collisions
 *   increases by 2.
 * - When a moving car collides with a stationary car, the number of collisions increases by
1.
 *
 * After a collision, the cars involved can no longer move and will stay at the point where
they
 * collided. Other than that, cars cannot change their state or direction of motion.
 *
 * Return the total number of collisions that will happen on the road.
 */

/**
 * @param {string} directions
 * @return {number}
 */
var countCollisions = function(directions) {
  let result = 0;
  let left = 0;
  let right = directions.length - 1;

  while (left < directions.length && directions[left] === 'L') left++;
  while (right >= 0 && directions[right] === 'R') right--;

  for (let i = left; i <= right; i++) {
    if (directions[i] !== 'S') result++;
  }

  return result;
};
```

2212 Maximum Points In An Archery Competition

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2212. Maximum Points in an Archery Competition
 * https://leetcode.com/problems/maximum-points-in-an-archery-competition/
 * Difficulty: Medium
 *
 * Alice and Bob are opponents in an archery competition. The competition has set the
 * following rules:
 * 1. Alice first shoots numArrows arrows and then Bob shoots numArrows arrows.
 * 2. The points are then calculated as follows:
 *    1. The target has integer scoring sections ranging from 0 to 11 inclusive.
 *    2. For each section of the target with score k (in between 0 to 11), say Alice and Bob
have
 *       shot ak and bk arrows on that section respectively. If ak >= bk, then Alice takes k
points.
 *       If ak < bk, then Bob takes k points.
 *    3. However, if ak == bk == 0, then nobody takes k points.
 * - For example, if Alice and Bob both shot 2 arrows on the section with score 11, then Alice
 takes
 *   11 points. On the other hand, if Alice shot 0 arrows on the section with score 11 and Bob
 shot
 *   2 arrows on that same section, then Bob takes 11 points.
 *
 * You are given the integer numArrows and an integer array aliceArrows of size 12, which
represents
 * the number of arrows Alice shot on each scoring section from 0 to 11. Now, Bob wants to
maximize
 * the total number of points he can obtain.
 *
 * Return the array bobArrows which represents the number of arrows Bob shot on each scoring
section
 * from 0 to 11. The sum of the values in bobArrows should equal numArrows.
 *
 * If there are multiple ways for Bob to earn the maximum total points, return any one of
```

```
them.
 */

/**
 * @param {number} numArrows
 * @param {number[]} aliceArrows
 * @return {number[]}
 */
var maximumBobPoints = function(numArrows, aliceArrows) {
  let maxScore = 0;

2224 Minimum Number Of Operations To Convert Time

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2224. Minimum Number of Operations to Convert Time
 * https://leetcode.com/problems/minimum-number-of-operations-to-convert-time/
 * Difficulty: Easy
 *
 * You are given two strings current and correct representing two 24-hour times.
 *
 * 24-hour times are formatted as "HH:MM", where HH is between 00 and 23, and MM is between 00
 * and 59. The earliest 24-hour time is 00:00, and the latest is 23:59.
 *
 * In one operation you can increase the time current by 1, 5, 15, or 60 minutes. You can
perform
 * this operation any number of times.
```

```
 *
 * Return the minimum number of operations needed to convert current to correct.
 */

/**
 * @param {string} current
 * @param {string} correct
 * @return {number}
 */

  const increments = [60, 15, 5, 1];
  let result = 0;

  for (const increment of increments) {
    result += Math.floor(diff / increment);
    diff %= increment;
  }

  return result;
};
```

2225 Find Players With Zero Or One Losses

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2225. Find Players With Zero or One Losses
 * https://leetcode.com/problems/find-players-with-zero-or-one-losses/
 * Difficulty: Medium
 *
 * You are given an integer array matches where matches[i] = [winneri, loseri] indicates that
 * the player winneri defeated player loseri in a match.
 *
 * Return a list answer of size 2 where:
 * - answer[0] is a list of all players that have not lost any matches.
 * - answer[1] is a list of all players that have lost exactly one match.
 *
 * The values in the two lists should be returned in increasing order.
 *
 * Note:
 * - You should only consider the players that have played at least one match.
 * - The testcases will be generated such that no two matches will have the same outcome.
 */

/**
 * @param {number[][]} matches
 * @return {number[][]}
 */
var findWinners = function(matches) {
  const lossCount = new Map();

  for (const [winner, loser] of matches) {
    lossCount.set(winner, lossCount.get(winner) || 0);
    lossCount.set(loser, (lossCount.get(loser) || 0) + 1);
  }

  const noLosses = [];
  const oneLoss = [];

  for (const [player, losses] of lossCount) {
    if (losses === 0) noLosses.push(player);
    else if (losses === 1) oneLoss.push(player);
  }
```

```
  return [
    noLosses.sort((a, b) => a - b),
    oneLoss.sort((a, b) => a - b)
  ];
};
```

2226 Maximum Candies Allocated To K Children

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2226. Maximum Candies Allocated to K Children
 * https://leetcode.com/problems/maximum-candies-allocated-to-k-children/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array candies. Each element in the array denotes a pile
of
 * candies of size candies[i]. You can divide each pile into any number of sub piles, but you
 * cannot merge two piles together.
 *
 * You are also given an integer k. You should allocate piles of candies to k children such
that
 * each child gets the same number of candies. Each child can be allocated candies from only
one
 * pile of candies and some piles of candies may go unused.
 *
 * Return the maximum number of candies each child can get.
 */

/**
 * @param {number[]} candies
 * @param {number} k
 * @return {number}
 */
var maximumCandies = function(candies, k) {
  let left = 0;
  let right = 1e7 + 1;

  while (left + 1 !== right) {
    const middle = Math.floor((left + right) / 2);
    let piles = 0;
    for (const candy of candies) {
      piles += Math.floor(candy / middle);
    }
    if (piles >= k) {
      left = middle;
    } else {
      right = middle;
    }
  }

  return left;
};
```

2227 Encrypt And Decrypt Strings

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2227. Encrypt and Decrypt Strings
 * https://leetcode.com/problems/encrypt-and-decrypt-strings/
 * Difficulty: Hard
 *
 * You are given a character array keys containing unique characters and a string array values
```

```
 * containing strings of length 2. You are also given another string array dictionary that
 * contains all permitted original strings after decryption. You should implement a data
structure
 * that can encrypt or decrypt a 0-indexed string.
 *
 * A string is encrypted with the following process:
 * 1. For each character c in the string, we find the index i satisfying keys[i] == c in keys.
 * 2. Replace c with values[i] in the string.
 *
 * Note that in case a character of the string is not present in keys, the encryption process
cannot
 * be carried out, and an empty string "" is returned.
 *
 * A string is decrypted with the following process:
 * 1. For each substring s of length 2 occurring at an even index in the string, we find an i
such
 *    that values[i] == s. If there are multiple valid i, we choose any one of them. This
means a
 *    string could have multiple possible strings it can decrypt to.
 * 2. Replace s with keys[i] in the string.
 *
 * Implement the Encrypter class:
 * - Encrypter(char[] keys, String[] values, String[] dictionary) Initializes the Encrypter
class
 *   with keys, values, and dictionary.
 * - String encrypt(String word1) Encrypts word1 with the encryption process described above
and
 *   returns the encrypted string.
 * - int decrypt(String word2) Returns the number of possible strings word2 could decrypt to
that
 *   also appear in dictionary.
 */

/**
 * @param {character[]} keys
 * @param {string[]} values
 * @param {string[]} dictionary
 */
var Encrypter = function(keys, values, dictionary) {
  this.encryptMap = new Map();
  this.validEncryptions = new Map();

  for (let i = 0; i < keys.length; i++) {
    this.encryptMap.set(keys[i], values[i]);
  }

  for (const word of dictionary) {
    const encrypted = this.encrypt(word);
    if (encrypted !== '') {
      this.validEncryptions.set(encrypted, (this.validEncryptions.get(encrypted) || 0) + 1);
    }
  }
};

/**
 * @param {string} word1
 * @return {string}
 */
Encrypter.prototype.encrypt = function(word1) {
  let result = '';

  for (const char of word1) {
    if (!this.encryptMap.has(char)) {
      return '';
    }
    result += this.encryptMap.get(char);
  }

  return result;
};

/**
 * @param {string} word2
 * @return {number}
 */
```

```
Encrypter.prototype.decrypt = function(word2) {
  return this.validEncryptions.get(word2) || 0;
};
```

2229 Check If An Array Is Consecutive

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2229. Check if an Array Is Consecutive
 * https://leetcode.com/problems/check-if-an-array-is-consecutive/
 * Difficulty: Easy
 *
 * Given an integer array nums, return true if nums is consecutive, otherwise return false.
 *
 * An array is consecutive if it contains every number in the range [x, x + n - 1]
(inclusive),
 * where x is the minimum number in the array and n is the length of the array.
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */

    } else {
      result.push(oddDigits[oddIndex++]);
    }
  }

  return parseInt(result.join(''), 10);
};
```

2232 Minimize Result By Adding Parentheses To Expression

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2232. Minimize Result by Adding Parentheses to Expression
 * https://leetcode.com/problems/minimize-result-by-adding-parentheses-to-expression/
 * Difficulty: Medium
 *
 * You are given a 0-indexed string expression of the form "<num1>+<num2>" where <num1>
 * and <num2> represent positive integers.
 *
 * Add a pair of parentheses to expression such that after the addition of parentheses,
 * expression is a valid mathematical expression and evaluates to the smallest possible
 * value. The left parenthesis must be added to the left of '+' and the right parenthesis
 * must be added to the right of '+'.
 *
 * Return expression after adding a pair of parentheses such that expression evaluates to the
 * smallest possible value. If there are multiple answers that yield the same result, return
 * any of them.
 *
 * The input has been generated such that the original value of expression, and the value of
 * expression after adding any pair of parentheses that meets the requirements fits within
 * a signed 32-bit integer.
 */

/**
 * @param {string} expression
 * @return {string}
 */
var minimizeResult = function(expression) {
  const plusIndex = expression.indexOf('+');
  const left = expression.slice(0, plusIndex);
  const right = expression.slice(plusIndex + 1);
  let minValue = Infinity;

    const pencils = Math.floor(remaining / cost2);
    result += pencils + 1;
  }

  return result;
};
```

2241 Design An Atm Machine

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2241. Design an ATM Machine
 * https://leetcode.com/problems/design-an-atm-machine/
 * Difficulty: Medium
 *
 * There is an ATM machine that stores banknotes of 5 denominations: 20, 50, 100, 200, and
 * 500 dollars. Initially the ATM is empty. The user can use the machine to deposit or
 * withdraw any amount of money.
 *
 * When withdrawing, the machine prioritizes using banknotes of larger values.
 * - For example, if you want to withdraw $300 and there are 2 $50 banknotes, 1 $100 banknote,
 *   and 1 $200 banknote, then the machine will use the $100 and $200 banknotes.
 * - However, if you try to withdraw $600 and there are 3 $200 banknotes and 1 $500 banknote,
 *   then the withdraw request will be rejected because the machine will first try to use the
 *   $500 banknote and then be unable to use banknotes to complete the remaining $100. Note
 *   that the machine is not allowed to use the $200 banknotes instead of the $500 banknote.
 *
 * Implement the ATM class:
 * - ATM() Initializes the ATM object.
 * - void deposit(int[] banknotesCount) Deposits new banknotes in the order $20, $50, $100,
 *   $200, and $500.
 * - int[] withdraw(int amount) Returns an array of length 5 of the number of banknotes that
 *   will be handed to the user in the order $20, $50, $100, $200, and $500, and update the
 *   number of banknotes in the ATM after withdrawing. Returns [-1] if it is not possible (do
 *   not withdraw any banknotes in this case).
 */

var ATM = function() {
  this.denominations = [20, 50, 100, 200, 500];
  this.notes = [0, 0, 0, 0, 0];
};

/**
 * @param {number[]} banknotesCount
 * @return {void}
 */
ATM.prototype.deposit = function(banknotesCount) {
  for (let i = 0; i < 5; i++) {
    this.notes[i] += banknotesCount[i];
  }
};

/**
 * @param {number} amount
 * @return {number[]}
 */
ATM.prototype.withdraw = function(amount) {
  const result = [0, 0, 0, 0, 0];
  let remaining = amount;

  for (let i = 4; i >= 0; i--) {
    const count = Math.min(Math.floor(remaining / this.denominations[i]), this.notes[i]);
    result[i] = count;
    remaining -= count * this.denominations[i];
  }

  if (remaining !== 0) return [-1];

2242 Maximum Score Of A Node Sequence

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2242. Maximum Score of a Node Sequence
 * https://leetcode.com/problems/maximum-score-of-a-node-sequence/
 * Difficulty: Hard
 *
 * There is an undirected graph with n nodes, numbered from 0 to n - 1.
 *
 * You are given a 0-indexed integer array scores of length n where scores[i] denotes the
score
 * of node i. You are also given a 2D integer array edges where edges[i] = [ai, bi] denotes
that
 * there exists an undirected edge connecting nodes ai and bi.
 *
 * A node sequence is valid if it meets the following conditions:
 * - There is an edge connecting every pair of adjacent nodes in the sequence.
 * - No node appears more than once in the sequence.
 *
 * The score of a node sequence is defined as the sum of the scores of the nodes in the
sequence.
 *
 * Return the maximum score of a valid node sequence with a length of 4. If no such sequence
exists,
 * return -1.
 */

/**
 * @param {number[]} scores
 * @param {number[][]} edges
 * @return {number}
 */
var maximumScore = function(scores, edges) {
  const n = scores.length;
  const graph = new Array(n).fill().map(() => []);

  for (const [a, b] of edges) {
    graph[a].push(b);
    graph[b].push(a);
  }

  for (let i = 0; i < n; i++) {
    graph[i].sort((a, b) => scores[b] - scores[a]);
    if (graph[i].length > 3) {
      graph[i] = graph[i].slice(0, 3);
    }
  }

  let result = -1;
  for (const [a, b] of edges) {
    for (const c of graph[a]) {

      }
    }
  }

  return result;
};
```

2243 Calculate Digit Sum Of A String

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2243. Calculate Digit Sum of a String
 * https://leetcode.com/problems/calculate-digit-sum-of-a-string/
 * Difficulty: Easy
 *
 * You are given a string s consisting of digits and an integer k.
 *
 * A round can be completed if the length of s is greater than k. In one round, do the
following:
 * 1. Divide s into consecutive groups of size k such that the first k characters are in the
first
 *    group, the next k characters are in the second group, and so on. Note that the size of
the
 *    last group can be smaller than k.
 * 2. Replace each group of s with a string representing the sum of all its digits. For
example,
 *    "346" is replaced with "13" because 3 + 4 + 6 = 13.
 * 3. Merge consecutive groups together to form a new string. If the length of the string is
greater
 *    than k, repeat from step 1.
 *
 * Return s after all rounds have been completed.
 */

/**
 * @param {string} s
 * @param {number} k
 * @return {string}
 */
var digitSum = function(s, k) {
  while (s.length > k) {
    let next = '';
    for (let i = 0; i < s.length; i += k) {
      const group = s.slice(i, i + k);
      const sum = group.split('').reduce((acc, digit) => acc + Number(digit), 0);
      next += sum;
    }
    s = next;
  }
  return s;
};
```

2244 Minimum Rounds To Complete All Tasks

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2244. Minimum Rounds to Complete All Tasks
 * https://leetcode.com/problems/minimum-rounds-to-complete-all-tasks/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array tasks, where tasks[i] represents the difficulty
level
 * of a task. In each round, you can complete either 2 or 3 tasks of the same difficulty
level.
 *
 * Return the minimum rounds required to complete all the tasks, or -1 if it is not possible
to
 * complete all the tasks.
 */
```

```
/**
 * @param {number[]} tasks
 * @return {number}
 */
var minimumRounds = function(tasks) {
  const map = new Map();
  let result = 0;

  tasks.forEach(task => map.set(task, map.has(task) ? map.get(task) + 1 : 1));

  for (const count of map.values()) {
    if (count < 2) {
      return -1;
    }
    result += Math.floor(count / 3) + (count % 3 === 0 ? 0 : 1);
  }

  return result;
};
```

2245 Maximum Trailing Zeros In A Cornered Path

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2245. Maximum Trailing Zeros in a Cornered Path
 * https://leetcode.com/problems/maximum-trailing-zeros-in-a-cornered-path/
 * Difficulty: Medium
 *
 * You are given a 2D integer array grid of size m x n, where each cell contains a positive
integer.
 *
 * A cornered path is defined as a set of adjacent cells with at most one turn. More
specifically,
 * the path should exclusively move either horizontally or vertically up to the turn (if there
 is
 * one), without returning to a previously visited cell. After the turn, the path will then
move
 * exclusively in the alternate direction: move vertically if it moved horizontally, and vice
versa,
 * also without returning to a previously visited cell.
 *
 * The product of a path is defined as the product of all the values in the path.
 *
 * Return the maximum number of trailing zeros in the product of a cornered path found in
grid.
 *
 * Note:
 * - Horizontal movement means moving in either the left or right direction.
 * - Vertical movement means moving in either the up or down direction.
 */

};
```

2254 Design Video Sharing Platform

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2254. Design Video Sharing Platform
 * https://leetcode.com/problems/design-video-sharing-platform/
 * Difficulty: Hard
```

```
 *
 * You have a video sharing platform where users can upload and delete videos. Each video is a
 * string of digits, where the ith digit of the string represents the content of the video at
 * minute i. For example, the first digit represents the content at minute 0 in the video, the
 * second digit represents the content at minute 1 in the video, and so on. Viewers of videos
 * can also like and dislike videos. Internally, the platform keeps track of the number of
views,
 * likes, and dislikes on each video.
 *
 * When a video is uploaded, it is associated with the smallest available integer videoId
starting
 * from 0. Once a video is deleted, the videoId associated with that video can be reused for
 * another video.
 *
 * Implement the VideoSharingPlatform class:
 * - VideoSharingPlatform() Initializes the object.
 * - int upload(String video) The user uploads a video. Return the videoId associated with
 *   the video.
 * - void remove(int videoId) If there is a video associated with videoId, remove the video.
 * - String watch(int videoId, int startMinute, int endMinute) If there is a video associated
with
 *   videoId, increase the number of views on the video by 1 and return the substring of the
video
 *   string starting at startMinute and ending at min(endMinute, video.length - 1)
(inclusive).
 *   Otherwise, return "-1".
 * - void like(int videoId) Increases the number of likes on the video associated with videoId
 by 1
 *   if there is a video associated with videoId.
 * - void dislike(int videoId) Increases the number of dislikes on the video associated with
videoId
 *   by 1 if there is a video associated with videoId.
 * - int[] getLikesAndDislikes(int videoId) Return a 0-indexed integer array values of length
2
 *   where values[0] is the number of likes and values[1] is the number of dislikes on the
video
 *   associated with videoId. If there is no video associated with videoId, return [-1].
 * - int getViews(int videoId) Return the number of views on the video associated with
videoId, if
 *   there is no video associated with videoId, return -1.
 */

      result++;
    }
  }

  return result;
};
```

2256 Minimum Average Difference

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2256. Minimum Average Difference
 * https://leetcode.com/problems/minimum-average-difference/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums of length n.
 *
 * The average difference of the index i is the absolute difference between the average of the
 * first i + 1 elements of nums and the average of the last n - i - 1 elements. Both averages
 * should be rounded down to the nearest integer.
 *
 * Return the index with the minimum average difference. If there are multiple such indices,
 * return the smallest one.
 *
 * Note:
 * - The absolute difference of two numbers is the absolute value of their difference.
 * - The average of n elements is the sum of the n elements divided (integer division) by n.
 * - The average of 0 elements is considered to be 0.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var minimumAverageDifference = function(nums) {

2258 Escape The Spreading Fire

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2258. Escape the Spreading Fire
 * https://leetcode.com/problems/escape-the-spreading-fire/
 * Difficulty: Hard
 *
 * You are given a 0-indexed 2D integer array grid of size m x n which represents a field.
 * Each cell has one of three values:
 * - 0 represents grass,
 * - 1 represents fire,
 * - 2 represents a wall that you and fire cannot pass through.
 *
 * You are situated in the top-left cell, (0, 0), and you want to travel to the safehouse at
the
 * bottom-right cell, (m - 1, n - 1). Every minute, you may move to an adjacent grass cell.
After
 * your move, every fire cell will spread to all adjacent cells that are not walls.
 *
 * Return the maximum number of minutes that you can stay in your initial position before
moving
 * while still safely reaching the safehouse. If this is impossible, return -1. If you can
always
 * reach the safehouse regardless of the minutes stayed, return 109.
 *
 * Note that even if the fire spreads to the safehouse immediately after you have reached it,
it
 * will be counted as safely reaching the safehouse.
 *
 * A cell is adjacent to another cell if the former is directly north, east, south, or west of
 the
 * latter (i.e., their sides are touching).
 */

2266 Count Number Of Texts

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2266. Count Number of Texts
 * https://leetcode.com/problems/count-number-of-texts/
 * Difficulty: Medium
 *
 * Alice is texting Bob using her phone. The mapping of digits to letters is shown in the
 * figure below.
 *
 * In order to add a letter, Alice has to press the key of the corresponding digit i times,
 * where i is the position of the letter in the key.
 * - For example, to add the letter 's', Alice has to press '7' four times. Similarly, to
 *   add the letter 'k', Alice has to press '5' twice.
 * - Note that the digits '0' and '1' do not map to any letters, so Alice does not use them.
 *
 * However, due to an error in transmission, Bob did not receive Alice's text message but
 * received a string of pressed keys instead.
 * - For example, when Alice sent the message "bob", Bob received the string "2266622".
 *
 * Given a string pressedKeys representing the string received by Bob, return the total
 * number of possible text messages Alice could have sent.
 *
 * Since the answer may be very large, return it modulo 109 + 7.
 */

/**

```

2284 Sender With Largest Word Count

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2284. Sender With Largest Word Count
 * https://leetcode.com/problems/sender-with-largest-word-count/
 * Difficulty: Medium
 *
 * You have a chat log of n messages. You are given two string arrays messages and senders
 * where messages[i] is a message sent by senders[i].
 *
 * A message is list of words that are separated by a single space with no leading or trailing
 * spaces. The word count of a sender is the total number of words sent by the sender. Note
 * that a sender may send more than one message.
 *
 * Return the sender with the largest word count. If there is more than one sender with the
 * largest word count, return the one with the lexicographically largest name.
 *
 * Note:
 * - Uppercase letters come before lowercase letters in lexicographical order.
 * - "Alice" and "alice" are distinct.
 */

/**
 * @param {string[]} messages
 * @param {string[]} senders
 * @return {string}
 */

      maxWords = totalWords;
      result = sender;
    }
  }

  return result;
};
```

2285 Maximum Total Importance Of Roads

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
```

```
 * 2285. Maximum Total Importance of Roads
 * https://leetcode.com/problems/maximum-total-importance-of-roads/
 * Difficulty: Medium
 *
 * You are given an integer n denoting the number of cities in a country. The cities are
 * numbered from 0 to n - 1.
 *
 * You are also given a 2D integer array roads where roads[i] = [ai, bi] denotes that there
 * exists a bidirectional road connecting cities ai and bi.
 *
 * You need to assign each city with an integer value from 1 to n, where each value can
 * only be used once. The importance of a road is then defined as the sum of the values
 * of the two cities it connects.
 *
 * Return the maximum total importance of all roads possible after assigning the values
 * optimally.
 */

/**
 * @param {number} n
 * @param {number[][]} roads
 * @return {number}
 */
var maximumImportance = function(n, roads) {
  const degrees = new Array(n).fill(0);

  for (const [a, b] of roads) {
    degrees[a]++;
    degrees[b]++;
  }

  const cities = Array.from({ length: n }, (_, i) => i);
  cities.sort((a, b) => degrees[b] - degrees[a]);

  let result = 0;
  for (let i = 0; i < n; i++) {
    result += degrees[cities[i]] * (n - i);
  }

  return result;
};
```

2286 Booking Concert Tickets In Groups

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2286. Booking Concert Tickets in Groups
 * https://leetcode.com/problems/booking-concert-tickets-in-groups/
 * Difficulty: Hard
 *
 * A concert hall has n rows numbered from 0 to n - 1, each with m seats, numbered from
 * 0 to m - 1. You need to design a ticketing system that can allocate seats in the following
cases:
 * - If a group of k spectators can sit together in a row.
 * - If every member of a group of k spectators can get a seat. They may or may not sit
together.
 *
 * Note that the spectators are very picky. Hence:
 * - They will book seats only if each member of their group can get a seat with row number
less
 *   than or equal to maxRow. maxRow can vary from group to group.
 * - In case there are multiple rows to choose from, the row with the smallest number is
chosen.
 *   If there are multiple seats to choose in the same row, the seat with the smallest number
is
 *   chosen.
 *
 * Implement the BookMyShow class:
 * - BookMyShow(int n, int m) Initializes the object with n as number of rows and m as number
```

```
of
 *   seats per row.
 * - int[] gather(int k, int maxRow) Returns an array of length 2 denoting the row and seat
number
 *   (respectively) of the first seat being allocated to the k members of the group, who must
sit
 *   together. In other words, it returns the smallest possible r and c such that all [c, c +
k - 1]
 *   seats are valid and empty in row r, and r <= maxRow. Returns [] in case it is not
possible to
 *   allocate seats to the group.
 * - boolean scatter(int k, int maxRow) Returns true if all k members of the group can be
allocated
 *   seats in rows 0 to maxRow, who may or may not sit together. If the seats can be
allocated, it
 *   allocates k seats to the group with the smallest row numbers, and the smallest possible
seat
 *   numbers in each row. Otherwise, returns false.
 */

2296 Design A Text Editor

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2296. Design a Text Editor
 * https://leetcode.com/problems/design-a-text-editor/
 * Difficulty: Hard
 *
 * Design a text editor with a cursor that can do the following:
 * - Add text to where the cursor is.
 * - Delete text from where the cursor is (simulating the backspace key).
 * - Move the cursor either left or right.
 *
 * When deleting text, only characters to the left of the cursor will be deleted. The cursor
 * will also remain within the actual text and cannot be moved beyond it. More formally,
 * we have that 0 <= cursor.position <= currentText.length always holds.
```

```
 *
 * Implement the TextEditor class:
 * - TextEditor() Initializes the object with empty text.
 * - void addText(string text) Appends text to where the cursor is. The cursor ends to the
 *   right of text.
 * - int deleteText(int k) Deletes k characters to the left of the cursor. Returns the number
 *   of characters actually deleted.
 * - string cursorLeft(int k) Moves the cursor to the left k times. Returns the last
 *   min(10, len) characters to the left of the cursor, where len is the number of characters
 *   to the left of the cursor.
 * - string cursorRight(int k) Moves the cursor to the right k times. Returns the last
 *   min(10, len) characters to the left of the cursor, where len is the number of characters
 *   to the left of the cursor.
 */

var TextEditor = function() {
  this.left = [];
  this.right = [];
};

/**
 * @param {string} text
 * @return {void}
 */
TextEditor.prototype.addText = function(text) {
  for (const char of text) {
    this.left.push(char);
  }
};

/**
 * @param {number} k
 * @return {number}
 */
TextEditor.prototype.deleteText = function(k) {
  const deleteCount = Math.min(k, this.left.length);
  for (let i = 0; i < deleteCount; i++) {
    this.left.pop();
  }
  return deleteCount;
};

/**
 * @param {number} k
 * @return {string}
 */
TextEditor.prototype.cursorLeft = function(k) {
  for (let i = 0; i < k && this.left.length; i++) {
    this.right.push(this.left.pop());
  }
  const start = Math.max(0, this.left.length - 10);

    while (currentSum * (right - left + 1) >= k) {
      currentSum -= nums[left];
      left++;
    }
    result += right - left + 1;
  }

  return result;
};
```

2303 Calculate Amount Paid In Taxes

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2303. Calculate Amount Paid in Taxes
 * https://leetcode.com/problems/calculate-amount-paid-in-taxes/
 * Difficulty: Easy
 *
 * You are given a 0-indexed 2D integer array brackets where brackets[i] = [upperi, percenti]
 * means that the ith tax bracket has an upper bound of upperi and is taxed at a rate of
percenti.
 * The brackets are sorted by upper bound (i.e. upperi-1 < upperi for 0 < i <
brackets.length).
 *
 * Tax is calculated as follows:
 * - The first upper0 dollars earned are taxed at a rate of percent0.
 * - The next upper1 - upper0 dollars earned are taxed at a rate of percent1.
 * - The next upper2 - upper1 dollars earned are taxed at a rate of percent2.
 * - And so on.
 *
 * You are given an integer income representing the amount of money you earned. Return the
 * amount of money that you have to pay in taxes. Answers within 10-5 of the actual answer
 * will be accepted.
```

```
 */

/**
 * @param {number[][]} brackets
 * @param {number} income
 * @return {number}
 */

2313 Minimum Flips In Binary Tree To Get Result

HARD

APPROACH NOTES

Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2313. Minimum Flips in Binary Tree to Get Result
 * https://leetcode.com/problems/minimum-flips-in-binary-tree-to-get-result/
 * Difficulty: Hard
 *
 * You are given the root of a binary tree with the following properties:
 * - Leaf nodes have either the value 0 or 1, representing false and true respectively.
 * - Non-leaf nodes have either the value 2, 3, 4, or 5, representing the boolean operations
 *   OR, AND, XOR, and NOT, respectively.
 *
 * You are also given a boolean result, which is the desired result of the evaluation of the
 * root node.
 *
 * The evaluation of a node is as follows:
 * - If the node is a leaf node, the evaluation is the value of the node, i.e. true or false.
 * - Otherwise, evaluate the node's children and apply the boolean operation of its value with
 *   the children's evaluations.
 *
 * In one operation, you can flip a leaf node, which causes a false node to become true, and
 * a true node to become false.
 *
 * Return the minimum number of operations that need to be performed such that the evaluation
 * of root yields result. It can be shown that there is always a way to achieve result.
 *
 * A leaf node is a node that has zero children.
 *
 * Note: NOT nodes have either a left child or a right child, but other non-leaf nodes have
both
 * a left child and a right child.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {boolean} result
 * @return {number}
 */

```

2321 Maximum Score Of Spliced Array

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2321. Maximum Score Of Spliced Array
 * https://leetcode.com/problems/maximum-score-of-spliced-array/
 * Difficulty: Hard
 *
 * You are given two 0-indexed integer arrays nums1 and nums2, both of length n.
 *
 * You can choose two integers left and right where 0 <= left <= right < n and swap the
subarray
 * nums1[left...right] with the subarray nums2[left...right].
 * - For example, if nums1 = [1,2,3,4,5] and nums2 = [11,12,13,14,15] and you choose left = 1
and
 *   right = 2, nums1 becomes [1,12,13,4,5] and nums2 becomes [11,2,3,14,15].
 *
 * You may choose to apply the mentioned operation once or not do anything.
 *
 * The score of the arrays is the maximum of sum(nums1) and sum(nums2), where sum(arr) is the
sum
 * of all the elements in the array arr.
 *
 * Return the maximum possible score.
 *
 * A subarray is a contiguous sequence of elements within an array. arr[left...right] denotes
the
 * subarray that contains the elements of nums between indices left and right (inclusive).
 */

    maxGain2 = Math.max(maxGain2, currGain2);
  }

  return Math.max(sum1 + maxGain1, sum2 + maxGain2);
};
```

2322 Minimum Score After Removals On A Tree

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2322. Minimum Score After Removals on a Tree
 * https://leetcode.com/problems/minimum-score-after-removals-on-a-tree/
 * Difficulty: Hard
 *
 * There is an undirected connected tree with n nodes labeled from 0 to n - 1 and n - 1 edges.
 *
 * You are given a 0-indexed integer array nums of length n where nums[i] represents the value
 * of the ith node. You are also given a 2D integer array edges of length n - 1 where
 * edges[i] = [ai, bi] indicates that there is an edge between nodes ai and bi in the tree.
 *
 * Remove two distinct edges of the tree to form three connected components. For a pair of
 * removed edges, the following steps are defined:
 * 1. Get the XOR of all the values of the nodes for each of the three components
respectively.
 * 2. The difference between the largest XOR value and the smallest XOR value is the score of
 *    the pair.
 * 3. For example, say the three components have the node values: [4,5,7], [1,9], and [3,3,3].
 *    The three XOR values are 4 ^ 5 ^ 7 = 6, 1 ^ 9 = 8, and 3 ^ 3 ^ 3 = 3. The largest XOR
 *    value is 8 and the smallest XOR value is 3. The score is then 8 - 3 = 5.
 *
 * Return the minimum score of any possible pair of edge removals on the given tree.
 */

```

2325 Decode The Message

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2325. Decode the Message
 * https://leetcode.com/problems/decode-the-message/
 * Difficulty: Easy
 *
 * You are given the strings key and message, which represent a cipher key and a secret
message,
 * respectively. The steps to decode message are as follows:
 * 1. Use the first appearance of all 26 lowercase English letters in key as the order of the
 *    substitution table.
 * 2. Align the substitution table with the regular English alphabet.
 * 3. Each letter in message is then substituted using the table.
 * 4. Spaces ' ' are transformed to themselves.
 * 5. For example, given key = "happy boy" (actual key would have at least one instance of
each
 *    letter in the alphabet), we have the partial substitution table of ('h' -> 'a', 'a' ->
'b',
 *    'p' -> 'c', 'y' -> 'd', 'b' -> 'e', 'o' -> 'f').
 *
 * Return the decoded message.
 */

/**
 * @param {string} key
```

```
 * @param {string} message
 * @return {string}
 */
var decodeMessage = function(key, message) {
  const substitution = new Map();
  let alphabetIndex = 0;

  for (const char of key) {
    if (char !== ' ' && !substitution.has(char)) {
      substitution.set(char, String.fromCharCode(97 + alphabetIndex++));
    }
  }

  let result = '';
  for (const char of message) {
    result += char === ' ' ? ' ' : substitution.get(char);
  }

  return result;
};
```

2326 Spiral Matrix Iv

MEDIUM

APPROACH NOTES

2328 Number Of Increasing Paths In A Grid

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2328. Number of Increasing Paths in a Grid
 * https://leetcode.com/problems/number-of-increasing-paths-in-a-grid/
 * Difficulty: Hard
 *
 * You are given an m x n integer matrix grid, where you can move from a cell to any adjacent
 * cell in all 4 directions.
 *
 * Return the number of strictly increasing paths in the grid such that you can start from any
 * cell and end at any cell. Since the answer may be very large, return it modulo 109 + 7.
 *
 * Two paths are considered different if they do not have exactly the same sequence of visited
 * cells.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var countPaths = function(grid) {
  const MOD = 1e9 + 7;
  const rows = grid.length;
  const cols = grid[0].length;
  const cache = new Array(rows).fill().map(() => new Array(cols).fill(0));
  const directions = [[0, 1], [1, 0], [0, -1], [-1, 0]];

      mismatches++;
    }
  }

  return mismatches <= 2;
};
```

2331 Evaluate Boolean Binary Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2331. Evaluate Boolean Binary Tree
 * https://leetcode.com/problems/evaluate-boolean-binary-tree/
 * Difficulty: Easy
 *
 * You are given the root of a full binary tree with the following properties:
 * - Leaf nodes have either the value 0 or 1, where 0 represents False and 1 represents True.
 * - Non-leaf nodes have either the value 2 or 3, where 2 represents the boolean OR and 3
represents
 *   the boolean AND.
 *
 * The evaluation of a node is as follows:
 * - If the node is a leaf node, the evaluation is the value of the node, i.e. True or False.
 * - Otherwise, evaluate the node's two children and apply the boolean operation of its value
with
 *   the children's evaluations.
 *
 * Return the boolean result of evaluating the root node.
 *
 * A full binary tree is a binary tree where each node has either 0 or 2 children.
 *
 * A leaf node is a node that has zero children.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {boolean}
 */
var evaluateTree = function(root) {
  if (!root.left && !root.right) return root.val === 1;

  const leftResult = evaluateTree(root.left);
```

```
  const rightResult = evaluateTree(root.right);

  return root.val === 2 ? leftResult || rightResult : leftResult && rightResult;
};
```

2332 The Latest Time To Catch A Bus

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2332. The Latest Time to Catch a Bus
 * https://leetcode.com/problems/the-latest-time-to-catch-a-bus/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array buses of length n, where buses[i] represents the
 * departure time of the ith bus. You are also given a 0-indexed integer array passengers of
 * length m, where passengers[j] represents the arrival time of the jth passenger. All bus
 * departure times are unique. All passenger arrival times are unique.
 *
 * You are given an integer capacity, which represents the maximum number of passengers that
 * can get on each bus.
 *
 * When a passenger arrives, they will wait in line for the next available bus. You can get
 * on a bus that departs at x minutes if you arrive at y minutes where y <= x, and the bus
 * is not full. Passengers with the earliest arrival times get on the bus first.
 *
 * More formally when a bus arrives, either:
 * - If capacity or fewer passengers are waiting for a bus, they will all get on the bus, or
 * - The capacity passengers with the earliest arrival times will get on the bus.
 *
 * Return the latest time you may arrive at the bus station to catch a bus. You cannot arrive
 * at the same time as another passenger.
 *
 * Note: The arrays buses and passengers are not necessarily sorted.
 */

```

2364 Count Number Of Bad Pairs

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 2364. Count Number of Bad Pairs
 * https://leetcode.com/problems/count-number-of-bad-pairs/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums. A pair of indices (i, j) is a bad pair
 * if i < j and j - i != nums[j] - nums[i].
 *
 * Return the total number of bad pairs in nums.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var countBadPairs = function(nums) {
  const map = new Map();
  let result = nums.length * (nums.length - 1) / 2;

  nums.forEach((n, i) => {
    result -= map.get(n - i) ?? 0;
    map.set(n - i, (map.get(n - i) ?? 0) + 1);
  });

  return result;
};
```

2365 Task Scheduler Ii

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2365. Task Scheduler II
 * https://leetcode.com/problems/task-scheduler-ii/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array of positive integers tasks, representing tasks that need
 * to be completed in order, where tasks[i] represents the type of the ith task.
 *
 * You are also given a positive integer space, which represents the minimum number of days
 * that must pass after the completion of a task before another task of the same type can be
 * performed.
 *
 * Each day, until all tasks have been completed, you must either:
 * - Complete the next task from tasks, or
 * - Take a break.
 *
 * Return the minimum number of days needed to complete all tasks.
 */

/**
 * @param {number[]} tasks
 * @param {number} space
 * @return {number}
 */

  }

  return result;
};
```

2371 Minimize Maximum Value In A Grid

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2371. Minimize Maximum Value in a Grid
 * https://leetcode.com/problems/minimize-maximum-value-in-a-grid/
 * Difficulty: Hard
 *
 * You are given an m x n integer matrix grid containing distinct positive integers.
 *
 * You have to replace each integer in the matrix with a positive integer satisfying the
 * following conditions:
 * - The relative order of every two elements that are in the same row or column should stay
 *   the same after the replacements.
 * - The maximum number in the matrix after the replacements should be as small as possible.
 *
```

```
 * The relative order stays the same if for all pairs of elements in the original matrix such
 * that grid[r1][c1] > grid[r2][c2] where either r1 == r2 or c1 == c2, then it must be true
 * that grid[r1][c1] > grid[r2][c2] after the replacements.
 *
 * For example, if grid = [[2, 4, 5], [7, 3, 9]] then a good replacement could be either
 * grid = [[1, 2, 3], [2, 1, 4]] or grid = [[1, 2, 3], [3, 1, 4]].
 *
 * Return the resulting matrix. If there are multiple answers, return any of them.
 */

/**
 * @param {number[][]} grid
 * @return {number[][]}
 */
var minScore = function(grid) {
  const rows = grid.length;
  const cols = grid[0].length;

  const positions = [];
  for (let i = 0; i < rows; i++) {
    for (let j = 0; j < cols; j++) {
      positions.push([grid[i][j], i, j]);
    }
  }

  positions.sort((a, b) => a[0] - b[0]);

  const result = new Array(rows).fill().map(() => new Array(cols).fill(0));
  const rowMax = new Array(rows).fill(0);
  const colMax = new Array(cols).fill(0);
  for (const [value, row, col] of positions) {
    const newValue = Math.max(rowMax[row], colMax[col]) + 1;
    result[row][col] = newValue;
    rowMax[row] = newValue;
    colMax[col] = newValue;
  }

  return result;
};
```

2373 Largest Local Values In A Matrix

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2373. Largest Local Values in a Matrix
 * https://leetcode.com/problems/largest-local-values-in-a-matrix/
 * Difficulty: Easy
 *
 * You are given an n x n integer matrix grid.
 *
 * Generate an integer matrix maxLocal of size (n - 2) x (n - 2) such that:
 * - maxLocal[i][j] is equal to the largest value of the 3 x 3 matrix in grid centered around
 *   row i + 1 and column j + 1.
 *
 * In other words, we want to find the largest value in every contiguous 3 x 3 matrix in grid.
 *
 * Return the generated matrix.
 */

/**
 * @param {number[][]} grid
 * @return {number[][]}

2398 Maximum Number Of Robots Within Budget

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2398. Maximum Number of Robots Within Budget
 * https://leetcode.com/problems/maximum-number-of-robots-within-budget/
 * Difficulty: Hard
 *
 * You have n robots. You are given two 0-indexed integer arrays, chargeTimes and
runningCosts,
 * both of length n. The ith robot costs chargeTimes[i] units to charge and costs
runningCosts[i]
 * units to run. You are also given an integer budget.
 *
 * The total cost of running k chosen robots is equal to max(chargeTimes) + k *
sum(runningCosts),
 * where max(chargeTimes) is the largest charge cost among the k robots and sum(runningCosts)
is
 * the sum of running costs among the k robots.
 *
 * Return the maximum number of consecutive robots you can run such that the total cost does
not
 * exceed budget.
 */

/**
 * @param {number[]} chargeTimes
 * @param {number[]} runningCosts
 * @param {number} budget
 * @return {number}
 */
```

```

      return false;
    }
  }

  return true;
};
```

2400 Number Of Ways To Reach A Position After Exactly K Steps

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2400. Number of Ways to Reach a Position After Exactly k Steps
 * https://leetcode.com/problems/number-of-ways-to-reach-a-position-after-exactly-k-steps/
 * Difficulty: Medium
 *
 * You are given two positive integers startPos and endPos. Initially, you are standing at
 * position startPos on an infinite number line. With one step, you can move either one
position
 * to the left, or one position to the right.
 *
 * Given a positive integer k, return the number of different ways to reach the position
endPos
 * starting from startPos, such that you perform exactly k steps. Since the answer may be very
 * large, return it modulo 109 + 7.
 *
 * Two ways are considered different if the order of the steps made is not exactly the same.
 *
 * Note that the number line includes negative integers.
 */

/**
 * @param {number} startPos
 * @param {number} endPos
 * @param {number} k
 * @return {number}
 */

```

2408 Design Sql

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2408. Design SQL
 * https://leetcode.com/problems/design-sql/
 * Difficulty: Medium
 *
 * You are given two string arrays, names and columns, both of size n. The ith table is
represented
 * by the name names[i] and contains columns[i] number of columns.
 *
 * You need to implement a class that supports the following operations:
 * - Insert a row in a specific table with an id assigned using an auto-increment method,
where the
 *   id of the first inserted row is 1, and the id of each new row inserted into the same
table is
 *   one greater than the id of the last inserted row, even if the last row was removed.
 * - Remove a row from a specific table. Removing a row does not affect the id of the next
inserted
 *   row.
 * - Select a specific cell from any table and return its value.
 * - Export all rows from any table in csv format.
 *
 * Implement the SQL class:
 * - SQL(String[] names, int[] columns)
 *   - Creates the n tables.
 * - bool ins(String name, String[] row)
 *   - Inserts row into the table name and returns true.
 *   - If row.length does not match the expected number of columns, or name is not a valid
table,
 *     returns false without any insertion.
 * - void rmv(String name, int rowId)
 *   - Removes the row rowId from the table name.
 *   - If name is not a valid table or there is no row with id rowId, no removal is performed.
 * - String sel(String name, int rowId, int columnId)
 *   - Returns the value of the cell at the specified rowId and columnId in the table name.
 *   - If name is not a valid table, or the cell (rowId, columnId) is invalid, returns
"<null>".
 * - String[] exp(String name)
 *   - Returns the rows present in the table name.
 *   - If name is not a valid table, returns an empty array. Each row is represented as a
string,
 *     with each cell value (including the row's id) separated by a ",".
 */

/**

2445 Number Of Nodes With Value One

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2445. Number of Nodes With Value One
 * https://leetcode.com/problems/number-of-nodes-with-value-one/
 * Difficulty: Medium
 *
 * There is an undirected connected tree with n nodes labeled from 1 to n and n - 1 edges.
 * You are given the integer n. The parent node of a node with a label v is the node with
 * the label floor (v / 2). The root of the tree is the node with the label 1.
 *
 * - For example, if n = 7, then the node with the label 3 has the node with the label
 *   floor(3 / 2) = 1 as its parent, and the node with the label 7 has the node with the
 *   label floor(7 / 2) = 3 as its parent.
 *
 * You are also given an integer array queries. Initially, every node has a value 0 on it.
 * For each query queries[i], you should flip all values in the subtree of the node with
 * the label queries[i].
 *
 * Return the total number of nodes with the value 1 after processing all the queries.
 *
 * Note that:
 * - Flipping the value of a node means that the node with the value 0 becomes 1 and vice
versa.
 * - floor(x) is equivalent to rounding x down to the nearest integer.
 */

/**
 * @param {number} n
 * @param {number[]} queries
 * @return {number}
 */
var numberOfNodes = function(n, queries) {

2450 Number Of Distinct Binary Strings After Applying Operations

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2450. Number of Distinct Binary Strings After Applying Operations
 * https://leetcode.com/problems/number-of-distinct-binary-strings-after-applying-operations/
 * Difficulty: Medium
 *
 * You are given a binary string s and a positive integer k.
 *
```

```
 * You can apply the following operation on the string any number of times:
 * - Choose any substring of size k from s and flip all its characters, that is, turn all 1's
 *   into 0's, and all 0's into 1's.
 * - Return the number of distinct strings you can obtain. Since the answer may be too large,
 *   return it modulo 109 + 7.
 *
 * Note that:
 * - A binary string is a string that consists only of the characters 0 and 1.
 * - A substring is a contiguous part of a string.
 */

/**
 * @param {string} s
 * @param {number} k
 * @return {number}
 */
var countDistinctStrings = function(s, k) {
  if (s.length <= 0) {
    return -1;
  }

  const MOD = 1e9 + 7;

  let result = 1;

  while (n > 0) {
    result = (result << 1) % MOD;
    n--;
  }

  return result;
};
```

2451 Odd String Difference

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2451. Odd String Difference
 * https://leetcode.com/problems/odd-string-difference/
 * Difficulty: Easy
 *
 * You are given an array of equal-length strings words. Assume that the length of each
 * string is n.
 *
 * Each string words[i] can be converted into a difference integer array difference[i] of
 * length n - 1 where difference[i][j] = words[i][j+1] - words[i][j] where 0 <= j <= n - 2.
 * Note that the difference between two letters is the difference between their positions in
 * the alphabet i.e. the position of 'a' is 0, 'b' is 1, and 'z' is 25.
 * - For example, for the string "acb", the difference integer array is [2 - 0, 1 - 2] = [2,
-1].
 *
 * All the strings in words have the same difference integer array, except one. You should
find
 * that string.
 *
 * Return the string in words that has different difference integer array.
 */

/**
 * @param {string[]} words
 * @return {string}
 */
var oddString = function(words) {
  const map = new Map();

      count++;
    }
  }

  return count > 0 ? Math.floor(sum / count) : 0;
};
```

2456 Most Popular Video Creator

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2456. Most Popular Video Creator
 * https://leetcode.com/problems/most-popular-video-creator/
 * Difficulty: Medium
 *
 * You are given two string arrays creators and ids, and an integer array views, all of length
 n.
 * The ith video on a platform was created by creators[i], has an id of ids[i], and has
views[i]
 * views.
 *
 * The popularity of a creator is the sum of the number of views on all of the creator's
videos.
 * Find the creator with the highest popularity and the id of their most viewed video.
 * - If multiple creators have the highest popularity, find all of them.
 * - If multiple videos have the highest view count for a creator, find the lexicographically
 *   smallest id.
 *
 * Note: It is possible for different videos to have the same id, meaning that ids do not
uniquely
 * identify a video. For example, two videos with the same ID are considered as distinct
videos
 * with their own viewcount.
 *
 * Return a 2D array of strings answer where answer[i] = [creatorsi, idi] means that creatorsi
 * has the highest popularity and idi is the id of their most popular video. The answer can be
 * returned in any order.
 */

2462 Total Cost To Hire K Workers

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2462. Total Cost to Hire K Workers
 * https://leetcode.com/problems/total-cost-to-hire-k-workers/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array costs where costs[i] is the cost of hiring
 * the ith worker.
 *
 * You are also given two integers k and candidates. We want to hire exactly k workers
 * according to the following rules:
 * - You will run k sessions and hire exactly one worker in each session.
 * - In each hiring session, choose the worker with the lowest cost from either the first
 *   candidates workers or the last candidates workers. Break the tie by the smallest index.
 *   - For example, if costs = [3,2,7,7,1,2] and candidates = 2, then in the first hiring
 *     session, we will choose the 4th worker because they have the lowest cost [3,2,7,7,1,2].
```

```
 *   - In the second hiring session, we will choose 1st worker because they have the same
 *     lowest cost as 4th worker but they have the smallest index [3,2,7,7,2]. Please note
 *     that the indexing may be changed in the process.
 * - If there are fewer than candidates workers remaining, choose the worker with the lowest
 *   cost among them. Break the tie by the smallest index.
 * - A worker can only be chosen once.
 *
 * Return the total cost to hire exactly k workers.
 */

/**
 * @param {number[]} costs
 * @param {number} k
 * @param {number} candidates
 * @return {number}
 */

/**
 * 2463. Minimum Total Distance Traveled
 * https://leetcode.com/problems/minimum-total-distance-traveled/
 * Difficulty: Hard
 *
 * There are some robots and factories on the X-axis. You are given an integer array robot
where
 * robot[i] is the position of the ith robot. You are also given a 2D integer array factory
where
 * factory[j] = [positionj, limitj] indicates that positionj is the position of the jth
factory
 * and that the jth factory can repair at most limitj robots.
 *
 * The positions of each robot are unique. The positions of each factory are also unique. Note
 * that a robot can be in the same position as a factory initially.
 *
 * All the robots are initially broken; they keep moving in one direction. The direction could
 be
```

```
 * the negative or the positive direction of the X-axis. When a robot reaches a factory that
did
 * not reach its limit, the factory repairs the robot, and it stops moving.
 *
 * At any moment, you can set the initial direction of moving for some robot. Your target is
to
 * minimize the total distance traveled by all the robots.
 *
 * Return the minimum total distance traveled by all the robots. The test cases are generated
 * such that all the robots can be repaired.
 *
 * Note that:
 * - All robots move at the same speed.
 * - If two robots move in the same direction, they will never collide.
 * - If two robots move in opposite directions and they meet at some point, they do not
collide.
 *   They cross each other.
 * - If a robot passes by a factory that reached its limits, it crosses it as if it does not
exist.
 * - If the robot moved from a position x to a position y, the distance it moved is |y - x|.
 */

/**
 * @param {number[]} robot
 * @param {number[][]} factory
 * @return {number}
 */
var minimumTotalDistance = function(robot, factory) {
  robot.sort((a, b) => a - b);
  factory.sort((a, b) => a[0] - b[0]);

  const robotCount = robot.length;
  const factoryCount = factory.length;
  const memo = new Array(robotCount + 1).fill(null).map(() => new Array(factoryCount +
1).fill(-1));

  return calculateMinDistance(0, 0);

  function calculateMinDistance(robotIndex, factoryIndex) {
    if (robotIndex === robotCount) return 0;
    if (factoryIndex === factoryCount) return 1e18;

    if (memo[robotIndex][factoryIndex] !== -1) {
      return memo[robotIndex][factoryIndex];
    }

    let totalDistance = 0;
    for (let robotsTaken = 0; robotsTaken < factory[factoryIndex][1]
         && robotIndex + robotsTaken < robotCount; robotsTaken++) {
      totalDistance += Math.abs(robot[robotIndex + robotsTaken] - factory[factoryIndex][0]);
      result = Math.min(
        result,
        totalDistance + calculateMinDistance(robotIndex + robotsTaken + 1, factoryIndex + 1)
      );
    }

    memo[robotIndex][factoryIndex] = result;
    return result;
  }
};
```

2464 Minimum Subarrays In A Valid Split

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2464. Minimum Subarrays in a Valid Split
 * https://leetcode.com/problems/minimum-subarrays-in-a-valid-split/
```

```
 * Difficulty: Medium
 *
 * You are given an integer array nums.
 *
 * Splitting of an integer array nums into subarrays is valid if:
 * - the greatest common divisor of the first and last elements of each subarray is
 *   greater than 1, and
 * - each element of nums belongs to exactly one subarray.
 *
 * Return the minimum number of subarrays in a valid subarray splitting of nums.
 * If a valid subarray splitting is not possible, return -1.
 *
 * Note that:
 * - The greatest common divisor of two numbers is the largest positive integer that
 *   evenly divides both numbers.
 * - A subarray is a contiguous non-empty part of an array.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var validSubarraySplit = function(nums) {
  const n = nums.length;
  const dp = new Array(n + 1).fill(Infinity);
  dp[0] = 0;

  for (let i = 0; i < n; i++) {
    if (dp[i] === Infinity) continue;

    for (let j = i; j < n; j++) {

  }
};
```

2465 Number Of Distinct Averages

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2465. Number of Distinct Averages
 * https://leetcode.com/problems/number-of-distinct-averages/
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums of even length.
 *
 * As long as nums is not empty, you must repetitively:
 * - Find the minimum number in nums and remove it.
 * - Find the maximum number in nums and remove it.
 * - Calculate the average of the two removed numbers.
 *
 * The average of two numbers a and b is (a + b) / 2.
 * - For example, the average of 2 and 3 is (2 + 3) / 2 = 2.5.
 *
 * Return the number of distinct averages calculated using the above process.
```

```
 *
 * Note that when there is a tie for a minimum or maximum number, any can be removed.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var distinctAverages = function(nums) {
  nums.sort((a, b) => a - b);
  const averages = new Set();

  for (let i = 0, j = nums.length - 1; i < j; i++, j--) {
    averages.add((nums[i] + nums[j]) / 2);
  }

  return averages.size;
};
```

2466 Count Ways To Build Good Strings

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2466. Count Ways To Build Good Strings
 * https://leetcode.com/problems/count-ways-to-build-good-strings/
 * Difficulty: Medium
 *
 * Given the integers zero, one, low, and high, we can construct a string by starting with an
 * empty string, and then at each step perform either of the following:
 * - Append the character '0' zero times.
 * - Append the character '1' one times.
 *
 * This can be performed any number of times.
 *
 * A good string is a string constructed by the above process having a length between low and
 * high (inclusive).
 *
 * Return the number of different good strings that can be constructed satisfying these
properties.
 * Since the answer can be large, return it modulo 109 + 7.
 */

/**
 * @param {number} low
 * @param {number} high
 * @param {number} zero
 * @param {number} one
 * @return {number}
 */
var countGoodStrings = function(low, high, zero, one) {
  const modulo = 1e9 + 7;
  const dp = new Array(high + 1).fill(0);

    if (length >= zero) {
      dp[length] = (dp[length] + dp[length - zero]) % modulo;
    }
    if (length >= one) {
      dp[length] = (dp[length] + dp[length - one]) % modulo;
    }
  }

  let result = 0;
  for (let length = low; length <= high; length++) {
    result = (result + dp[length]) % modulo;
  }

  return result;
```

```
};
```

2467 Most Profitable Path In A Tree

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2467. Most Profitable Path in a Tree
 * https://leetcode.com/problems/most-profitable-path-in-a-tree/
 * Difficulty: Medium
 *
 * There is an undirected tree with n nodes labeled from 0 to n - 1, rooted at node 0. You are
 * given a 2D integer array edges of length n - 1 where edges[i] = [ai, bi] indicates that
 * there is an edge between nodes ai and bi in the tree.
 *
 * At every node i, there is a gate. You are also given an array of even integers amount,
where
 * amount[i] represents:
 * - the price needed to open the gate at node i, if amount[i] is negative, or,
 * - the cash reward obtained on opening the gate at node i, otherwise.
 *
 * The game goes on as follows:
 * - Initially, Alice is at node 0 and Bob is at node bob.
 * - At every second, Alice and Bob each move to an adjacent node. Alice moves towards some
leaf
 *   node, while Bob moves towards node 0.
 * - For every node along their path, Alice and Bob either spend money to open the gate at
that
 *   node, or accept the reward. Note that:
 *   - If the gate is already open, no price will be required, nor will there be any cash
reward.
 *   - If Alice and Bob reach the node simultaneously, they share the price/reward for opening
 *     the gate there. In other words, if the price to open the gate is c, then both Alice and
 *     Bob pay c / 2 each. Similarly, if the reward at the gate is c, both of them receive
 *     c / 2 each.
 * - If Alice reaches a leaf node, she stops moving. Similarly, if Bob reaches node 0, he
stops
 *   moving. Note that these events are independent of each other.
 *
 * Return the maximum net income Alice can have if she travels towards the optimal leaf node.
 */

/**
 * @param {number[][]} edges
 * @param {number} bob
 * @param {number[]} amount
 * @return {number}
 */

};
```

2468 Split Message Based On Limit

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2468. Split Message Based on Limit
 * https://leetcode.com/problems/split-message-based-on-limit/
 * Difficulty: Hard
 *
 * You are given a string, message, and a positive integer, limit.
 *
 * You must split message into one or more parts based on limit. Each resulting part should
have
 * the suffix "<a/b>", where "b" is to be replaced with the total number of parts and "a" is
to
 * be replaced with the index of the part, starting from 1 and going up to b. Additionally,
the
 * length of each resulting part (including its suffix) should be equal to limit, except for
the
 * last part whose length can be at most limit.
 *
 * The resulting parts should be formed such that when their suffixes are removed and they are
 * all concatenated in order, they should be equal to message. Also, the result should contain
 * as few parts as possible.
 *
 * Return the parts message would be split into as an array of strings. If it is impossible to
 * split message as required, return an empty array.
 */

/**
 * @param {string} message
 * @param {number} limit
 * @return {string[]}
 */
var splitMessage = function(message, limit) {
  const n = message.length;

```

2477 Minimum Fuel Cost To Report To The Capital

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2477. Minimum Fuel Cost to Report to the Capital
 * https://leetcode.com/problems/minimum-fuel-cost-to-report-to-the-capital/
 * Difficulty: Medium
 *
 * There is a tree (i.e., a connected, undirected graph with no cycles) structure country
network
 * consisting of n cities numbered from 0 to n - 1 and exactly n - 1 roads. The capital city
is
 * city 0. You are given a 2D integer array roads where roads[i] = [ai, bi] denotes that there
 * exists a bidirectional road connecting cities ai and bi.
 *
 * There is a meeting for the representatives of each city. The meeting is in the capital
city.
 *
 * There is a car in each city. You are given an integer seats that indicates the number of
seats
 * in each car.
 *
 * A representative can use the car in their city to travel or change the car and ride with
another
 * representative. The cost of traveling between two cities is one liter of fuel.
 *
 * Return the minimum number of liters of fuel to reach the capital city.
 */

/**
 * @param {number[][]} roads
 * @param {number} seats
 * @return {number}
 */
var minimumFuelCost = function(roads, seats) {
  const n = roads.length + 1;
  const graph = Array.from({ length: n }, () => []);
  for (const [a, b] of roads) {
    graph[a].push(b);
    graph[b].push(a);
  }

  let fuel = 0;
  dfs(0, -1);
  return fuel;

  function dfs(node, parent) {
    let representatives = 1;
    for (const neighbor of graph[node]) {
      if (neighbor !== parent) {
        representatives += dfs(neighbor, node);
      }
    }
    if (node !== 0) {
      fuel += Math.ceil(representatives / seats);
    }
    return representatives;
  }
};
```

2479 Maximum Xor Of Two Non Overlapping Subtrees

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2479. Maximum XOR of Two Non-Overlapping Subtrees
 * https://leetcode.com/problems/maximum-xor-of-two-non-overlapping-subtrees/
 * Difficulty: Hard
 *
 * There is an undirected tree with n nodes labeled from 0 to n - 1. You are given the integer
 * n and a 2D integer array edges of length n - 1, where edges[i] = [ai, bi] indicates that
 * there is an edge between nodes ai and bi in the tree. The root of the tree is the node
labeled 0.
 *
 * Each node has an associated value. You are given an array values of length n, where
values[i]
 * is the value of the ith node.
 *
 * Select any two non-overlapping subtrees. Your score is the bitwise XOR of the sum of the
 * values within those subtrees.
 *
 * Return the maximum possible score you can achieve. If it is impossible to find two
 * nonoverlapping subtrees, return 0.
 *
 * Note that:
 * - The subtree of a node is the tree consisting of that node and all of its descendants.
 * - Two subtrees are non-overlapping if they do not share any common node.

2481 Minimum Cuts To Divide A Circle

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2481. Minimum Cuts to Divide a Circle
 * https://leetcode.com/problems/minimum-cuts-to-divide-a-circle/
 * Difficulty: Easy
 *
 * A valid cut in a circle can be:
 * - A cut that is represented by a straight line that touches two points on the edge of the
 *   circle and passes through its center, or
 * - A cut that is represented by a straight line that touches one point on the edge of the
 *   circle and its center.
 *
 * Some valid and invalid cuts are shown in the figures below.
 *
 * Given the integer n, return the minimum number of cuts needed to divide a circle into n
 * equal slices.
 */

/**
 * @param {number} n
 * @return {number}
 */
var numberOfCuts = function(n) {
  return n === 1 ? 0 : n % 2 === 0 ? n / 2 : n;
};
```

2482 Difference Between Ones And Zeros In Row And Column

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2482. Difference Between Ones and Zeros in Row and Column
 * https://leetcode.com/problems/difference-between-ones-and-zeros-in-row-and-column/
 * Difficulty: Medium
 *
 * You are given a 0-indexed m x n binary matrix grid.
 *
 * A 0-indexed m x n difference matrix diff is created with the following procedure:
 * - Let the number of ones in the ith row be onesRowi.
 * - Let the number of ones in the jth column be onesColj.
 * - Let the number of zeros in the ith row be zerosRowi.
 * - Let the number of zeros in the jth column be zerosColj.
 * - diff[i][j] = onesRowi + onesColj - zerosRowi - zerosColj
 *
 * Return the difference matrix diff.
 */

/**
 * @param {number[][]} grid
 * @return {number[][]}
 */

  }

  return result;
};
```

2489 Number Of Substrings With Fixed Ratio

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2489. Number of Substrings With Fixed Ratio
 * https://leetcode.com/problems/number-of-substrings-with-fixed-ratio/
 * Difficulty: Medium
 *
 * You are given a binary string s, and two integers num1 and num2. num1 and num2 are
 * coprime numbers.
 *
 * A ratio substring is a substring of s where the ratio between the number of 0's and
 * the number of 1's in the substring is exactly num1 : num2.
 * - For example, if num1 = 2 and num2 = 3, then "01011" and "1110000111" are ratio
substrings,
 *   while "11000" is not.
```

```
 *
 * Return the number of non-empty ratio substrings of s.
 *
 * Note that:
 * - A substring is a contiguous sequence of characters within a string.
 * - Two values x and y are coprime if gcd(x, y) == 1 where gcd(x, y) is the greatest common
 *   divisor of x and y.
 */

/**
 * @param {string} s
 * @param {number} num1
 * @param {number} num2
 * @return {number}
 */
var fixedRatio = function(s, num1, num2) {
  const n = s.length;

    }

    const difference = ones * num1 - zeros * num2;

    if (map.has(difference)) {
      result += map.get(difference);
    }

    map.set(difference, (map.get(difference) || 0) + 1);
  }

  return result;
};
```

2490 Circular Sentence

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2490. Circular Sentence
 * https://leetcode.com/problems/circular-sentence/
 * Difficulty: Easy
 *
 * A sentence is a list of words that are separated by a single space with no leading or
trailing spaces.
 *
 * For example, "Hello World", "HELLO", "hello world hello world" are all sentences.
 * Words consist of only uppercase and lowercase English letters. Uppercase and lowercase
English letters
 * are considered different.
 *
 * A sentence is circular if:
 * - The last character of a word is equal to the first character of the next word.
 * - The last character of the last word is equal to the first character of the first word.
 *
 * For example, "leetcode exercises sound delightful", "eetcode", "leetcode eats soul" are all
 circular
 * sentences. However, "Leetcode is cool", "happy Leetcode", "Leetcode" and "I like Leetcode"
are not
 * circular sentences.
 *
 * Given a string sentence, return true if it is circular. Otherwise, return false.
```

```
 */

/**
 * @param {string} sentence
 * @return {boolean}
 */
var isCircularSentence = function(sentence) {

      result = Math.min(result, dist);
      if (!visited.has(nextCity)) {
        queue.push(nextCity);
      }
    }
  }

  return result;
};
```

2493 Divide Nodes Into The Maximum Number Of Groups

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2493. Divide Nodes Into the Maximum Number of Groups
 * https://leetcode.com/problems/divide-nodes-into-the-maximum-number-of-groups/
 * Difficulty: Hard
 *
 * You are given a positive integer n representing the number of nodes in an undirected graph.
 * The nodes are labeled from 1 to n.
 *
 * You are also given a 2D integer array edges, where edges[i] = [ai, bi] indicates that there
 * is a bidirectional edge between nodes ai and bi. Notice that the given graph may be
disconnected.
 *
 * Divide the nodes of the graph into m groups (1-indexed) such that:
 * - Each node in the graph belongs to exactly one group.
 * - For every pair of nodes in the graph that are connected by an edge [ai, bi], if ai
belongs to
 *   the group with index x, and bi belongs to the group with index y, then |y - x| = 1.
 *
 * Return the maximum number of groups (i.e., maximum m) into which you can divide the nodes.
 * Return -1 if it is impossible to group the nodes with the given conditions.

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2498. Frog Jump II
 * https://leetcode.com/problems/frog-jump-ii/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array stones sorted in strictly increasing order
representing
 * the positions of stones in a river.
 *
 * A frog, initially on the first stone, wants to travel to the last stone and then return to
the
 * first stone. However, it can jump to any stone at most once.
 *
 * The length of a jump is the absolute difference between the position of the stone the frog
is
 * currently on and the position of the stone to which the frog jumps.
 *
 * - More formally, if the frog is at stones[i] and is jumping to stones[j], the length of the
```

```
 jump
 *   is |stones[i] - stones[j]|.
 *
 * The cost of a path is the maximum length of a jump among all jumps in the path.
 *
 * Return the minimum cost of a path for the frog.
 */

      current *= current;
      length++;
    }

    if (length >= 2) {
      result = Math.max(result, length);
    }
  }

  return result;
};
```

2502 Design Memory Allocator

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2502. Design Memory Allocator
 * https://leetcode.com/problems/design-memory-allocator/
 * Difficulty: Medium
 *
 * You are given an integer n representing the size of a 0-indexed memory array. All memory
 * units are initially free.
 *
 * You have a memory allocator with the following functionalities:
 * 1. Allocate a block of size consecutive free memory units and assign it the id mID.
 * 2. Free all memory units with the given id mID.
 *
 * Note that:
```

```
 * - Multiple blocks can be allocated to the same mID.
 * - You should free all the memory units with mID, even if they were allocated in different
blocks.
 *
 * Implement the Allocator class:
 * - Allocator(int n) Initializes an Allocator object with a memory array of size n.
 * - int allocate(int size, int mID) Find the leftmost block of size consecutive free memory
units
 *   and allocate it with the id mID. Return the block's first index. If such a block does not
 *   exist, return -1.
 * - int freeMemory(int mID) Free all memory units with the id mID. Return the number of
memory
 *   units you have freed.
 */

    return sum;
  }
};
```

2509 Cycle Length Queries In A Tree

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2509. Cycle Length Queries in a Tree
 * https://leetcode.com/problems/cycle-length-queries-in-a-tree/
 * Difficulty: Hard
 *
 * You are given an integer n. There is a complete binary tree with 2n - 1 nodes. The root of
 * that tree is the node with the value 1, and every node with a value val in the range
 * [1, 2n - 1 - 1] has two children where:
 * - The left node has the value 2 * val, and
 * - The right node has the value 2 * val + 1.
 *
 * You are also given a 2D integer array queries of length m, where queries[i] = [ai, bi]. For
 * each query, solve the following problem:
 * 1. Add an edge between the nodes with values ai and bi.
 * 2. Find the length of the cycle in the graph.
 * 3. Remove the added edge between nodes with values ai and bi.
 *
 * Note that:
 * - A cycle is a path that starts and ends at the same node, and each edge in the path is
 *   visited only once.
 * - The length of a cycle is the number of edges visited in the cycle.
 * - There could be multiple edges between two nodes in the tree after adding the edge of
 *   the query.
 *
 * Return an array answer of length m where answer[i] is the answer to the ith query.
 */

/**
 * @param {number} n
 * @param {number[][]} queries
 * @return {number[]}
 */

2512 Reward Top K Students

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2512. Reward Top K Students
 * https://leetcode.com/problems/reward-top-k-students/
 * Difficulty: Medium
 *
 * You are given two string arrays positive_feedback and negative_feedback, containing the
words
 * denoting positive and negative feedback, respectively. Note that no word is both positive
and
 * negative.
 *
 * Initially every student has 0 points. Each positive word in a feedback report increases the
 * points of a student by 3, whereas each negative word decreases the points by 1.
 *
 * You are given n feedback reports, represented by a 0-indexed string array report and a
 * 0-indexed integer array student_id, where student_id[i] represents the ID of the student
 * who has received the feedback report report[i]. The ID of each student is unique.
 *
 * Given an integer k, return the top k students after ranking them in non-increasing order
 * by their points. In case more than one student has the same points, the one with the lower
 * ID ranks higher.
 */

2545 Sort The Students By Their Kth Score

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2545. Sort the Students by Their Kth Score
 * https://leetcode.com/problems/sort-the-students-by-their-kth-score/
 * Difficulty: Medium
 *
 * There is a class with m students and n exams. You are given a 0-indexed m x n integer
matrix
 * score, where each row represents one student and score[i][j] denotes the score the ith
student
 * got in the jth exam. The matrix score contains distinct integers only.
 *
 * You are also given an integer k. Sort the students (i.e., the rows of the matrix) by their
 * scores in the kth (0-indexed) exam from the highest to the lowest.
 *
 * Return the matrix after sorting it.
 */

/**
 * @param {number[][]} score
 * @param {number} k
 * @return {number[][]}
 */
var sortTheStudents = function(score, k) {
  return score.sort((studentA, studentB) => studentB[k] - studentA[k]);
};
```

2546 Apply Bitwise Operations To Make Strings Equal

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2546. Apply Bitwise Operations to Make Strings Equal
 * https://leetcode.com/problems/apply-bitwise-operations-to-make-strings-equal/
 * Difficulty: Medium
 *
 * You are given two 0-indexed binary strings s and target of the same length n. You can do
the
 * following operation on s any number of times:
 * - Choose two different indices i and j where 0 <= i, j < n.
 * - Simultaneously, replace s[i] with (s[i] OR s[j]) and s[j] with (s[i] XOR s[j]).
 *
 * For example, if s = "0110", you can choose i = 0 and j = 2, then simultaneously replace
s[0]
 * with (s[0] OR s[2] = 0 OR 1 = 1), and s[2] with (s[0] XOR s[2] = 0 XOR 1 = 1), so we will
 * have s = "1110".
 *
 * Return true if you can make the string s equal to target, or false otherwise.
 */

/**
 * @param {string} s
 * @param {string} target
 * @return {boolean}
 */
var makeStringsEqual = function(s, target) {
  return (s.includes('1') === target.includes('1'));
};
```

2547 Minimum Cost To Split An Array

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2547. Minimum Cost to Split an Array
 * https://leetcode.com/problems/minimum-cost-to-split-an-array/
 * Difficulty: Hard
 *
 * You are given an integer array nums and an integer k.
 *
 * Split the array into some number of non-empty subarrays. The cost of a split is the sum of
 * the importance value of each subarray in the split.
 *
 * Let trimmed(subarray) be the version of the subarray where all numbers which appear only
 * once are removed.
 * - For example, trimmed([3,1,2,4,3,4]) = [3,4,3,4].
 *
 * The importance value of a subarray is k + trimmed(subarray).length.
 * - For example, if a subarray is [1,2,3,3,3,4,4], then trimmed([1,2,3,3,3,4,4]) =
[3,3,3,4,4].
 *   The importance value of this subarray will be k + 5.
 *
 * Return the minimum possible cost of a split of nums.
 *
 * A subarray is a contiguous non-empty sequence of elements within an array.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
```

```
var minCost = function(nums, k) {
  const n = nums.length;
  const dp = new Array(n + 1).fill(Infinity);
  dp[0] = 0;

  for (let end = 1; end <= n; end++) {
    const freq = new Map();
    let trimLen = 0;
    for (let start = end - 1; start >= 0; start--) {
      const num = nums[start];
      const count = (freq.get(num) || 0) + 1;
      freq.set(num, count);
      if (count === 1) trimLen++;
      if (count === 2) trimLen--;
      dp[end] = Math.min(dp[end], dp[start] + k + (end - start - trimLen));
    }
  }

  return dp[n];
};
```

2548 Maximum Price To Fill A Bag

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2548. Maximum Price to Fill a Bag
 * https://leetcode.com/problems/maximum-price-to-fill-a-bag/
 * Difficulty: Medium
 *
 * You are given a 2D integer array items where items[i] = [pricei, weighti] denotes the
 * price and weight of the ith item, respectively.
 *
 * You are also given a positive integer capacity.
 *
 * Each item can be divided into two items with ratios part1 and part2, where part1 + part2 ==
 1.
 * - The weight of the first item is weighti * part1 and the price of the first item is
 *   pricei * part1.
 * - Similarly, the weight of the second item is weighti * part2 and the price of the second
 *   item is pricei * part2.
 *
 * Return the maximum total price to fill a bag of capacity capacity with given items. If it
 * is impossible to fill a bag return -1. Answers within 10-5 of the actual answer will be
 * considered accepted.
 */

/**
 * @param {number[][]} items
 * @param {number} capacity
 * @return {number}
 */
var maxPrice = function(items, capacity) {

```

2549 Count Distinct Numbers On Board

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2549. Count Distinct Numbers on Board
 * https://leetcode.com/problems/count-distinct-numbers-on-board/
 * Difficulty: Easy
 *
 * You are given a positive integer n, that is initially placed on a board. Every day, for
 * 109 days, you perform the following procedure:
 * - For each number x present on the board, find all numbers 1 <= i <= n such that x % i ==
1.
 * - Then, place those numbers on the board.
 *
 * Return the number of distinct integers present on the board after 109 days have elapsed.
 *
 * Note:
 * - Once a number is placed on the board, it will remain on it until the end.
 * - % stands for the modulo operation. For example, 14 % 3 is 2.
 */

/**
 * @param {number} n
 * @return {number}
 */
var distinctIntegers = function(n) {
  return n === 1 ? 1 : n - 1;
};
```

2551 Put Marbles In Bags

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2551. Put Marbles in Bags
 * https://leetcode.com/problems/put-marbles-in-bags/
 * Difficulty: Hard
 *
 * You have k bags. You are given a 0-indexed integer array weights where weights[i] is the
weight
 * of the ith marble. You are also given the integer k.
 *
 * Divide the marbles into the k bags according to the following rules:
 * - No bag is empty.
 * - If the ith marble and jth marble are in a bag, then all marbles with an index between the
 ith
 *   and jth indices should also be in that same bag.
 * - If a bag consists of all the marbles with an index from i to j inclusively, then the cost
 of
 *   the bag is weights[i] + weights[j].
 *
 * The score after distributing the marbles is the sum of the costs of all the k bags.
 *
 * Return the difference between the maximum and minimum scores among marble distributions.
 */

/**
 * @param {number[]} weights
 * @param {number} k
 * @return {number}
 */
var putMarbles = function(weights, k) {
  const n = weights.length;
  if (k === n) return 0;

2561 Rearranging Fruits

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2561. Rearranging Fruits
 * https://leetcode.com/problems/rearranging-fruits/
 * Difficulty: Hard
 *
 * You have two fruit baskets containing n fruits each. You are given two 0-indexed integer
 * arrays basket1 and basket2 representing the cost of fruit in each basket. You want to
 * make both baskets equal. To do so, you can use the following operation as many times as you
 want:
 * - Chose two indices i and j, and swap the ith fruit of basket1 with the jth fruit of
basket2.
 * - The cost of the swap is min(basket1[i],basket2[j]).
 *
 * Two baskets are considered equal if sorting them according to the fruit cost makes them
 * exactly the same baskets.
 *
 * Return the minimum cost to make both the baskets equal or -1 if impossible.
 */

/**
 * @param {number[]} basket1
 * @param {number[]} basket2
 * @return {number}
 */
var minCost = function(basket1, basket2) {
  const count1 = new Map();
  const count2 = new Map();

  for (const fruit of basket1) {
    count1.set(fruit, (count1.get(fruit) || 0) + 1);
  }

  for (const fruit of basket2) {
    count2.set(fruit, (count2.get(fruit) || 0) + 1);
```

```
  }

  const allFruits = new Set([...basket1, ...basket2]);
  const excess1 = [];
  const excess2 = [];
  let minCost = Infinity;

  for (const fruit of allFruits) {
    const freq1 = count1.get(fruit) || 0;
    const freq2 = count2.get(fruit) || 0;

    result += Math.min(directSwap, doubleSwap);
  }

  return result;
};
```

2562 Find The Array Concatenation Value

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2562. Find the Array Concatenation Value
 * https://leetcode.com/problems/find-the-array-concatenation-value/
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums.
 *
 * The concatenation of two numbers is the number formed by concatenating their numerals.
 * - For example, the concatenation of 15, 49 is 1549.
 *
 * The concatenation value of nums is initially equal to 0. Perform this operation until nums
 * becomes empty:
 * - If nums has a size greater than one, add the value of the concatenation of the first and
 *   the last element to the concatenation value of nums, and remove those two elements from
 *   nums. For example, if the nums was [1, 2, 4, 5, 6], add 16 to the concatenation value.
 * - If only one element exists in nums, add its value to the concatenation value of nums,
 *   then remove it.
 *
 * Return the concatenation value of nums.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
```

```
var findTheArrayConcVal = function(nums) {
  let result = 0;
  let left = 0;
  let right = nums.length - 1;

  while (left <= right) {
    if (left === right) {
      result += nums[left];
    } else {
      result += Number(`${nums[left]}${nums[right]}`);
    }
    left++;
    right--;
  }

  return result;
};
```

2563 Count The Number Of Fair Pairs

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2563. Count the Number of Fair Pairs
 * https://leetcode.com/problems/count-the-number-of-fair-pairs/
 * Difficulty: Medium
 *
 * Given a 0-indexed integer array nums of size n and two integers lower and upper, return the
 * number of fair pairs.
 *
 * A pair (i, j) is fair if:
 * - 0 <= i < j < n, and
 * - lower <= nums[i] + nums[j] <= upper
 */

/**
 * @param {number[]} nums
 * @param {number} lower
 * @param {number} upper
 * @return {number}
 */

        left = mid + 1;
      }
    }

    return index;
  }
};
```

2566 Maximum Difference By Remapping A Digit

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2566. Maximum Difference by Remapping a Digit
 * https://leetcode.com/problems/maximum-difference-by-remapping-a-digit/
 * Difficulty: Easy
 *
 * You are given an integer num. You know that Bob will sneakily remap one of the 10 possible
 * digits (0 to 9) to another digit.
 *
 * Return the difference between the maximum and minimum values Bob can make by remapping
 * exactly one digit in num.
 *
 * Notes:
 * - When Bob remaps a digit d1 to another digit d2, Bob replaces all occurrences of d1 in
 *   num with d2.
 * - Bob can remap a digit to itself, in which case num does not change.
 * - Bob can remap different digits for obtaining minimum and maximum values respectively.
 * - The resulting number after remapping can contain leading zeroes.
 */

/**
 * @param {number} num
 * @return {number}
 */
var minMaxDifference = function(num) {
  const digits = String(num).split('');
  let maxNum = num;
  let minNum = num;

    }
  }

  return maxNum - minNum;
};
```

2567 Minimum Score By Changing Two Elements

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2567. Minimum Score by Changing Two Elements
 * https://leetcode.com/problems/minimum-score-by-changing-two-elements/
 * Difficulty: Medium
 *
 * You are given an integer array nums.
```

```
 * - The low score of nums is the minimum absolute difference between any two integers.
 * - The high score of nums is the maximum absolute difference between any two integers.
 * - The score of nums is the sum of the high and low scores.
 *
 * Return the minimum score after changing two elements of nums.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var minimizeSum = function(nums) {
  const sorted = nums.sort((a, b) => a - b);

  return Math.min(
    sorted[sorted.length - 2] - sorted[1],
    sorted[sorted.length - 1] - sorted[2],
    sorted[sorted.length - 3] - sorted[0]
  );
};
```

2568 Minimum Impossible Or

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2568. Minimum Impossible OR
 * https://leetcode.com/problems/minimum-impossible-or/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums.
 *
 * We say that an integer x is expressible from nums if there exist some integers
 * 0 <= index1 < index2 < ... < indexk < nums.length for which
 * nums[index1] | nums[index2] | ... | nums[indexk] = x. In other words, an
 * integer is expressible if it can be written as the bitwise OR of some subsequence
 * of nums.
 *
 * Return the minimum positive non-zero integer that is not expressible from nums.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var minImpossibleOR = function(nums) {

  }

  return result;
};
```

2570 Merge Two 2D Arrays By Summing Values

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2570. Merge Two 2D Arrays by Summing Values
 * https://leetcode.com/problems/merge-two-2d-arrays-by-summing-values/
 * Difficulty: Easy
```

```
 *
 * You are given two 2D integer arrays nums1 and nums2.
 * - nums1[i] = [idi, vali] indicate that the number with the id idi has a value equal to
vali.
 * - nums2[i] = [idi, vali] indicate that the number with the id idi has a value equal to
vali.
 *
 * Each array contains unique ids and is sorted in ascending order by id.
 *
 * Merge the two arrays into one array that is sorted in ascending order by id, respecting the
 * following conditions:
 * - Only ids that appear in at least one of the two arrays should be included in the
resulting
 *   array.
 * - Each id should be included only once and its value should be the sum of the values of
this
 *   id in the two arrays. If the id does not exist in one of the two arrays, then assume its
 *   value in that array to be 0.
 *
 * Return the resulting array. The returned array must be sorted in ascending order by id.
 */

/**
 * @param {number[][]} nums1
 * @param {number[][]} nums2
 * @return {number[][]}
 */
var mergeArrays = function(nums1, nums2) {
  const map = new Map(nums1);
  for (const [key, value] of nums2) {
    map.set(key, (map.get(key) ?? 0) + value);
  }
  return [...map].sort((a, b) => a[0] - b[0]);
};
```

2571 Minimum Operations To Reduce An Integer To 0

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2571. Minimum Operations to Reduce an Integer to 0
 * https://leetcode.com/problems/minimum-operations-to-reduce-an-integer-to-0/
 * Difficulty: Medium
 *
 * You are given a positive integer n, you can do the following operation any number of times:
 * - Add or subtract a power of 2 from n.
 *
 * Return the minimum number of operations to make n equal to 0.
 *
 * A number x is power of 2 if x == 2i where i >= 0.
 */

/**
 * @param {number} n
 * @return {number}
 */
var minOperations = function(n) {
  let result = 0;

  while (n > 0) {
    if ((n & 1) === 0) {
      n >>= 1;
    } else if ((n & 3) === 3) {
      n += 1;
      result++;
    } else {
      n -= 1;
      result++;
    }
  }
```

```
  return result;
};
```

2574 Left And Right Sum Differences

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2574. Left and Right Sum Differences
 * https://leetcode.com/problems/left-and-right-sum-differences/
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums of size n.
 *
 * Define two arrays leftSum and rightSum where:
 * - leftSum[i] is the sum of elements to the left of the index i in the array nums.
 *   If there is no such element, leftSum[i] = 0.
 * - rightSum[i] is the sum of elements to the right of the index i in the array nums.
 *   If there is no such element, rightSum[i] = 0.
 *
 * Return an integer array answer of size n where answer[i] = |leftSum[i] - rightSum[i]|.
 */

/**
 * @param {number[]} nums
 * @return {number[]}
 */
var leftRightDifference = function(nums) {
  const n = nums.length;
  const result = new Array(n).fill(0);
  let leftSum = 0;
  let rightSum = nums.reduce((sum, num) => sum + num, 0);

  for (let i = 0; i < n; i++) {
    rightSum -= nums[i];
    result[i] = Math.abs(leftSum - rightSum);
    leftSum += nums[i];
  }

  return result;
};
```

2576 Find The Maximum Number Of Marked Indices

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2576. Find the Maximum Number of Marked Indices
 * https://leetcode.com/problems/find-the-maximum-number-of-marked-indices/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums.
 *
 * Initially, all of the indices are unmarked. You are allowed to make this operation any
 * number of times:
 * - Pick two different unmarked indices i and j such that 2 * nums[i] <= nums[j], then
 *   mark i and j.
 *
 * Return the maximum possible number of marked indices in nums using the above operation
 * any number of times.
 */

/**
 * @param {number[]} nums
```

```
 * @return {number}
 */
var maxNumOfMarkedIndices = function(nums) {
  nums.sort((a, b) => a - b);
  let result = 0;
  let left = 0;
  let right = Math.floor(nums.length / 2);

    if (2 * nums[left] <= nums[right]) {
      result += 2;
      left++;
      right++;
    } else {
      right++;
    }
  }

  return result;
};
```

2578 Split With Minimum Sum

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2578. Split With Minimum Sum
 * https://leetcode.com/problems/split-with-minimum-sum/
 * Difficulty: Easy
 *
 * Given a positive integer num, split it into two non-negative integers num1 and num2 such
that:
 * - The concatenation of num1 and num2 is a permutation of num.
 *   - In other words, the sum of the number of occurrences of each digit in num1 and num2 is
equal
 *     to the number of occurrences of that digit in num.
 * - num1 and num2 can contain leading zeros.
 *
 * Return the minimum possible sum of num1 and num2.
 *
 * Notes:
 * - It is guaranteed that num does not contain any leading zeros.
 * - The order of occurrence of the digits in num1 and num2 may differ from the order of
occurrence
 *   of num.
 */

/**
 * @param {number} num
 * @return {number}
 */

      num1 += digits[i];
    } else {
      num2 += digits[i];
    }
  }

  return Number(num1) + Number(num2);
};
```

2579 Count Total Number Of Colored Cells

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2579. Count Total Number of Colored Cells
 * https://leetcode.com/problems/count-total-number-of-colored-cells/
 * Difficulty: Medium
 *
 * There exists an infinitely large two-dimensional grid of uncolored unit cells.
 * You are given a positive integer n, indicating that you must do the following
 * routine for n minutes:
 * - At the first minute, color any arbitrary unit cell blue.
 * - Every minute thereafter, color blue every uncolored cell that touches a blue cell.
 *
 * Below is a pictorial representation of the state of the grid after minutes 1, 2, and 3.
 */

/**
 * @param {number} n
 * @return {number}
 */
var coloredCells = function(n) {
  return 1 + 2 * n * (n - 1);
};
```

2581 Count Number Of Possible Root Nodes

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2581. Count Number of Possible Root Nodes
 * https://leetcode.com/problems/count-number-of-possible-root-nodes/
 * Difficulty: Hard
 *
 * Alice has an undirected tree with n nodes labeled from 0 to n - 1. The tree is represented
as a
 * 2D integer array edges of length n - 1 where edges[i] = [ai, bi] indicates that there is an
 edge
 * between nodes ai and bi in the tree.
 *
 * Alice wants Bob to find the root of the tree. She allows Bob to make several guesses about
her
 * tree. In one guess, he does the following:
 * - Chooses two distinct integers u and v such that there exists an edge [u, v] in the tree.
 * - He tells Alice that u is the parent of v in the tree.
 *
 * Bob's guesses are represented by a 2D integer array guesses where guesses[j] = [uj, vj]
indicates
 * Bob guessed uj to be the parent of vj.
 *
 * Alice being lazy, does not reply to each of Bob's guesses, but just says that at least k of
 his
 * guesses are true.
 *
 * Given the 2D integer arrays edges, guesses and the integer k, return the number of possible
 * nodes that can be the root of Alice's tree. If there is no such tree, return 0.
 */

2587 Rearrange Array To Maximize Prefix Score

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2587. Rearrange Array to Maximize Prefix Score
 * https://leetcode.com/problems/rearrange-array-to-maximize-prefix-score/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums. You can rearrange the elements of nums to any
 * order (including the given order).
 *
 * Let prefix be the array containing the prefix sums of nums after rearranging it. In other
words,
 * prefix[i] is the sum of the elements from 0 to i in nums after rearranging it. The score of
 nums
 * is the number of positive integers in the array prefix.
 *
 * Return the maximum score you can achieve.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var maxScore = function(nums) {
  const sorted = nums.sort((a, b) => b - a);
  let prefixSum = 0;
  let result = 0;

  for (const num of sorted) {
    prefixSum += num;
    if (prefixSum > 0) result++;
    else break;
  }

  return result;
};
```

2588 Count The Number Of Beautiful Subarrays

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2588. Count the Number of Beautiful Subarrays
 * https://leetcode.com/problems/count-the-number-of-beautiful-subarrays/
 * Difficulty: Medium
```

```
 *
 * You are given a 0-indexed integer array nums. In one operation, you can:
 * - Choose two different indices i and j such that 0 <= i, j < nums.length.
 * - Choose a non-negative integer k such that the kth bit (0-indexed) in the binary
representation
 *   of nums[i] and nums[j] is 1.
 * - Subtract 2k from nums[i] and nums[j].
 *
 * A subarray is beautiful if it is possible to make all of its elements equal to 0 after
applying
 * the above operation any number of times.
 *
 * Return the number of beautiful subarrays in the array nums.
 *
 * A subarray is a contiguous non-empty sequence of elements within an array.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var beautifulSubarrays = function(nums) {
  let result = 0;
  const prefixXOR = new Map([[0, 1]]);
  let currentXOR = 0;

  for (const num of nums) {
    currentXOR ^= num;
    result += prefixXOR.get(currentXOR) || 0;
    prefixXOR.set(currentXOR, (prefixXOR.get(currentXOR) || 0) + 1);
  }

  return result;
};
```

2590 Design A Todo List

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2590. Design a Todo List
 * https://leetcode.com/problems/design-a-todo-list/
 * Difficulty: Medium
 *
 * Design a Todo List Where users can add tasks, mark them as complete, or get a list of
pending
 * tasks. Users can also add tags to tasks and can filter the tasks by certain tags.
 *
 * Implement the TodoList class:
 * - TodoList() Initializes the object.
 * - int addTask(int userId, String taskDescription, int dueDate, List<String> tags) Adds a
task for
 *   the user with the ID userId with a due date equal to dueDate and a list of tags attached
to the
 *   task. The return value is the ID of the task. This ID starts at 1 and is sequentially
 *   increasing. That is, the first task's id should be 1, the second task's id should be 2,
and so
 *   on.
 * - List<String> getAllTasks(int userId) Returns a list of all the tasks not marked as
complete for
 *   the user with ID userId, ordered by the due date. You should return an empty list if the
user
 *   has no uncompleted tasks.
 * - List<String> getTasksForTag(int userId, String tag) Returns a list of all the tasks that
are
 *   not marked as complete for the user with the ID userId and have tag as one of their tags,
 *   ordered by their due date. Return an empty list if no such task exists.
 * - void completeTask(int userId, int taskId) Marks the task with the ID taskId as completed
only
 *   if the task exists and the user with the ID userId has this task, and it is uncompleted.
```

```
 */

var TodoList = function() {
  this.nextTaskId = 1;
  this.userTasks = new Map();
  this.allTasks = new Map();
};

/**
 * @param {number} userId
 * @param {string} taskDescription
 * @param {number} dueDate
 * @param {string[]} tags
 * @return {number}
 */
TodoList.prototype.addTask = function(userId, taskDescription, dueDate, tags) {
  const taskId = this.nextTaskId++;
  const task = {

2609 Find The Longest Balanced Substring Of A Binary String

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2609. Find the Longest Balanced Substring of a Binary String
 * https://leetcode.com/problems/find-the-longest-balanced-substring-of-a-binary-string/
 * Difficulty: Easy
 *
 * You are given a binary string s consisting only of zeroes and ones.
 *
 * A substring of s is considered balanced if all zeroes are before ones and the number of
zeroes
 * is equal to the number of ones inside the substring. Notice that the empty substring is
 * considered a balanced substring.
 *
 * Return the length of the longest balanced substring of s.
 *
 * A substring is a contiguous sequence of characters within a string.
 */

/**
 * @param {string} s
 * @return {number}
 */
var findTheLongestBalancedSubstring = function(s) {
  let result = 0;

2618 Check If Object Instance Of Class

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2618. Check if Object Instance of Class
 * https://leetcode.com/problems/check-if-object-instance-of-class/
 * Difficulty: Medium
 *
 * Write a function that checks if a given value is an instance of a given class or
superclass.
 * For this problem, an object is considered an instance of a given class if that object has
 * access to that class's methods.
 *
 * There are no constraints on the data types that can be passed to the function. For example,
 * the value or the class could be undefined.
 */

/**
 * @param {*} obj
 * @param {*} classFunction
 * @return {boolean}
 */
var checkIfInstanceOf = function(obj, classFunction) {
  if (obj === null || obj === undefined || typeof classFunction !== 'function') {
    return false;
  }
  return Object(obj) instanceof classFunction;
};
```

2619 Array Prototype Last

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2619. Array Prototype Last
 * https://leetcode.com/problems/array-prototype-last/
 * Difficulty: Easy
 *
 * Write code that enhances all arrays such that you can call the array.last() method on
 * any array and it will return the last element. If there are no elements in the array,
 * it should return -1.
 *
 * You may assume the array is the output of JSON.parse.
 */

/**
 * @return {null|boolean|number|string|Array|Object}
 */
Array.prototype.last = function() {
  return !this.length ? -1 : this[this.length - 1];
};
```

2620 Counter

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2620. Counter
```

```
 * https://leetcode.com/problems/counter/
 * Difficulty: Easy
 *
 * Given an integer n, return a counter function. This counter function initially
 * returns n and then returns 1 more than the previous value every subsequent
 * time it is called (n, n + 1, n + 2, etc).
 */

/**
 * @param {number} n
 * @return {Function} counter
 */
var createCounter = function(n) {

  return () => count++;
};
```

2621 Sleep

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2621. Sleep
 * https://leetcode.com/problems/sleep/
 * Difficulty: Easy
 *
 * Given a positive integer `ms`, write an asynchronous function that
 * sleeps for `ms` milliseconds. It can resolve any value.
 */

/**
 * @param {number} ms
 * @return {Promise}
 */
async function sleep(ms) {
  return new Promise((resolve) => setTimeout(resolve, ms));
}
```

2622 Cache With Time Limit

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 2622. Cache With Time Limit
 * https://leetcode.com/problems/cache-with-time-limit/
 * Difficulty: Medium
 *
 * Write a class that allows getting and setting key-value pairs, however a time until
 * expiration is associated with each key.
 *
 * The class has three public methods:
 * - set(key, value, duration): accepts an integer key, an integer value, and a duration
 *   in milliseconds. Once the duration has elapsed, the key should be inaccessible.
 *   The method should return true if the same un-expired key already exists and false
 *   otherwise. Both the value and duration should be overwritten if the key already exists.
 *
 * - get(key): if an un-expired key exists, it should return the associated value.
 *   Otherwise it should return -1.
 *
 * - count(): returns the count of un-expired keys.
 */

var TimeLimitedCache = function() {
  this.cache = new Map();
};
```

```
/**
 * @param {number} key
 * @param {number} value
 * @param {number} duration time until expiration in ms
 * @return {boolean} if un-expired key already existed
 */
TimeLimitedCache.prototype.set = function(key, value, duration) {
  const hit = this.cache.has(key) && this.cache.get(key)[1] > Date.now();
  this.cache.set(key, [value, Date.now() + duration]);
  return hit;
};

/**
 * @param {number} key
 * @return {number} value associated with key
 */
TimeLimitedCache.prototype.get = function(key) {
  if (!this.cache.has(key)) return -1;
  const [value, expiredAt] = this.cache.get(key);
  return expiredAt > Date.now() ? value : -1;
};

/**
 * @return {number} count of non-expired keys
 */
TimeLimitedCache.prototype.count = function() {
  return [...this.cache.keys()].reduce((count, key) => {
    return this.cache.get(key)[1] > Date.now() ? ++count : count;
  }, 0);
};
```

2623 Memoize

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 2623. Memoize
 * https://leetcode.com/problems/memoize/
 * Difficulty: Medium
 *
 * Given a function fn, return a memoized version of that function.
 *
 * A memoized function is a function that will never be called twice
 * with the same inputs. Instead it will return a cached value.
 *
 * You can assume there are 3 possible input functions: sum, fib,
 * and factorial.
 *
 * - `sum` accepts two integers a and b and returns a + b. Assume that
 *   if a value has already been cached for the arguments (b, a) where
 *   a != b, it cannot be used for the arguments (a, b). For example,
 *   if the arguments are (3, 2) and (2, 3), two separate calls should
 *   be made.
 * - `fib` accepts a single integer n and returns 1 if n <= 1 or
 *   fib(n - 1) + fib(n - 2) otherwise.
 * - `factorial` accepts a single integer n and returns 1 if n <= 1 or
 *   factorial(n - 1) * n otherwise.
 */

/**
 * @param {Function} fn
 * @return {Function}
 */
function memoize(fn) {
  const cache = new Map();

  return (...args) => {
    const key = String(args);
    if (cache.has(key)) {
```

```
      return cache.get(key);
    }
    const value = fn(...args);
    cache.set(key, value);
    return value;
  };
}
```

2624 Snail Traversal

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2624. Snail Traversal
 * https://leetcode.com/problems/snail-traversal/
 * Difficulty: Medium
 *
 * Write code that enhances all arrays such that you can call the snail(rowsCount,
 * colsCount) method that transforms the 1D array into a 2D array organised in the
 * pattern known as snail traversal order. Invalid input values should output an
 * empty array. If rowsCount * colsCount !== nums.length, the input is considered invalid.
 *
 * Snail traversal order starts at the top left cell with the first value of the
 * current array. It then moves through the entire first column from top to bottom,
 * followed by moving to the next column on the right and traversing it from bottom
 * to top. This pattern continues, alternating the direction of traversal with each
 * column, until the entire current array is covered. For example, when given the
 * input array [19, 10, 3, 7, 9, 8, 5, 2, 1, 17, 16, 14, 12, 18, 6, 13, 11, 20, 4, 15]
 * with rowsCount = 5 and colsCount = 4, the desired output matrix is shown below.
 * Note that iterating the matrix following the arrows corresponds to the order
 * of numbers in the original array.
 */

/**
 * @param {number} rowsCount
 * @param {number} colsCount
 * @return {Array<Array<number>>}
 */
Array.prototype.snail = function(rowsCount, colsCount) {
  if (rowsCount * colsCount !== this.length) return [];

  const result = Array.from({ length: rowsCount }, () => []);
  let index = 0;

  for (let col = 0; col < colsCount; col++) {
    if (col % 2 === 0) {
      for (let row = 0; row < rowsCount; row++) {
        result[row][col] = this[index++];
      }
    } else {
      for (let row = rowsCount - 1; row >= 0; row--) {
        result[row][col] = this[index++];
      }
    }
  }

  return result;
}
```

2625 Flatten Deeply Nested Array

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2625. Flatten Deeply Nested Array
```

```
 * https://leetcode.com/problems/flatten-deeply-nested-array/
 * Difficulty: Medium
 *
 * Given a multi-dimensional array arr and a depth n, return a flattened version of that
array.
 *
 * A multi-dimensional array is a recursive data structure that contains integers or other
 * multi-dimensional arrays.
 *
 * A flattened array is a version of that array with some or all of the sub-arrays removed and
 * replaced with the actual elements in that sub-array. This flattening operation should only
 * be done if the current depth of nesting is less than n. The depth of the elements in the
 * first array are considered to be 0.
 *
 * Please solve it without the built-in Array.flat method.
 */

/**
 * @param {Array} arr
 * @param {number} depth
 * @return {Array}
 */
var flat = function(arr, n) {
  if (n === 0) return arr;
  const result = [];
  for (let i = 0; i < arr.length; i++) {
    result.push(...(Array.isArray(arr[i]) ? flat(arr[i], n - 1) : [arr[i]]));
  }
  return result;
};
```

2626 Array Reduce Transformation

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2626. Array Reduce Transformation
 * https://leetcode.com/problems/array-reduce-transformation/
 * Difficulty: Easy
 *
 * Given an integer array nums, a reducer function fn, and an initial value init, return the
final
 * result obtained by executing the fn function on each element of the array, sequentially,
 * passing in the return value from the calculation on the preceding element.
 *
 * This result is achieved through the following operations: val = fn(init, nums[0]),
 * val = fn(val, nums[1]), val = fn(val, nums[2]), ... until every element in the array has
been
 * processed. The ultimate value of val is then returned.
 *
 * If the length of the array is 0, the function should return init.
 *
 * Please solve it without using the built-in Array.reduce method.
 */

/**
 * @param {number[]} nums
 * @param {Function} fn
 * @param {number} init
 * @return {number}
 */
var reduce = function(nums, fn, init) {
  let result = init;

  for (let i = 0; i < nums.length; i++) {
    result = fn(result, nums[i]);
  }

  return result;
};
```

2627 Debounce

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2627. Debounce
 * https://leetcode.com/problems/debounce/
 * Difficulty: Medium
 *
 * Given a function fn and a time in milliseconds t, return a debounced version of that
function.
 *
 * A debounced function is a function whose execution is delayed by t milliseconds and whose
 * execution is cancelled if it is called again within that window of time. The debounced
 * function should also receive the passed parameters.
 *
 * For example, let's say t = 50ms, and the function was called at 30ms, 60ms, and 100ms.
 *
 * The first 2 function calls would be cancelled, and the 3rd function call would be executed
 * at 150ms.
 *
 * If instead t = 35ms, The 1st call would be cancelled, the 2nd would be executed at 95ms,
 * and the 3rd would be executed at 135ms.
 */

/**
 * @param {Function} fn
 * @param {number} t milliseconds
 * @return {Function}
 */
var debounce = function(fn, t) {
  let timer;
  return (...args) => {
    clearTimeout(timer);
    timer = setTimeout(() => fn(...args), t);
  };
};
```

2628 Json Deep Equal

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2628. JSON Deep Equal
 * https://leetcode.com/problems/json-deep-equal/
 * Difficulty: Medium
 *
 * Given two values o1 and o2, return a boolean value indicating whether two values, o1 and
o2,
 * are deeply equal.
 *
 * For two values to be deeply equal, the following conditions must be met:
 * - If both values are primitive types, they are deeply equal if they pass the === equality
check.
 * - If both values are arrays, they are deeply equal if they have the same elements in the
same
 *   order, and each element is also deeply equal according to these conditions.
 * - If both values are objects, they are deeply equal if they have the same keys, and the
 *   associated values for each key are also deeply equal according to these conditions.
 *
 * You may assume both values are the output of JSON.parse. In other words, they are valid
JSON.
 *
 * Please solve it without using lodash's _.isEqual() function
 */
```

```
/**
 * @param {null|boolean|number|string|Array|Object} o1
 * @param {null|boolean|number|string|Array|Object} o2
 * @return {boolean}
 */

  return keys1.every(key => keys2.includes(key) && areDeeplyEqual(o1[key], o2[key]));
};
```

2629 Function Composition

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2629. Function Composition
 * https://leetcode.com/problems/function-composition/
 * Difficulty: Easy
 *
 * Given an array of functions [f1, f2, f3, ..., fn], return a new function fn that is the
function
 * composition of the array of functions.
 *
 * The function composition of [f(x), g(x), h(x)] is fn(x) = f(g(h(x))).
 *
 * The function composition of an empty list of functions is the identity function f(x) = x.
 *
 * You may assume each function in the array accepts one integer as input and returns one
integer
 * as output.
 */

/**
 * @param {Function[]} functions
 * @return {Function}
 */
var compose = function(functions) {
  return x => functions.reduceRight((result, fn) => fn(result), x);
};
```

2630 Memoize Ii

HARD

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 2630. Memoize II
 * https://leetcode.com/problems/memoize-ii/
 * Difficulty: Hard
 *
 * Given a function fn, return a memoized version of that function.
```

```
 *
 * A memoized function is a function that will never be called twice
 * with the same inputs. Instead it will return a cached value.
 *
 * fn can be any function and there are no constraints on what type
 * of values it accepts. Inputs are considered identical if they
 * are === to each other.
 */

/**
 * @param {Function} fn
 * @return {Function}
 */
function memoize(fn) {
  const cache = {};
  const idLookup = new Map();
  function generateId(item) {
    return idLookup.get(item) ?? idLookup.set(item, idLookup.size + 1).get(item);
  }
  return (...args) => {
    const key = args.map(generateId).join('-');
    return !cache.hasOwnProperty(key) ? (cache[key] = fn(...args)) : cache[key];
  };
}
```

2631 Group By

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2631. Group By
 * https://leetcode.com/problems/group-by/
 * Difficulty: Medium
 *
 * Write code that enhances all arrays such that you can call the array.groupBy(fn) method on
any
 * array and it will return a grouped version of the array.
 *
 * A grouped array is an object where each key is the output of fn(arr[i]) and each value is
an
 * array containing all items in the original array which generate that key.
 *
 * The provided callback fn will accept an item in the array and return a string key.
 *
 * The order of each value list should be the order the items appear in the array. Any order
of
 * keys is acceptable.
 *
 * Please solve it without lodash's _.groupBy function.
 */

/**
 * @param {Function} fn
 * @return {Object}
 */
Array.prototype.groupBy = function(fn) {
  return this.reduce((grouped, item) => {
    const key = fn(item);
    grouped[key] = grouped[key] || [];
    grouped[key].push(item);
    return grouped;
  }, {});
};

/**
 * [1,2,3].groupBy(String) // {"1":[1],"2":[2],"3":[3]}
 */
```

2632 Curry

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2632. Curry
 * https://leetcode.com/problems/curry/
 * Difficulty: Medium
 *
 * Given a function fn, return a curried version of that function.
 *
 * A curried function is a function that accepts fewer or an equal number of parameters as the
 * original function and returns either another curried function or the same value the
original
 * function would have returned.
 *
 * In practical terms, if you called the original function like sum(1,2,3), you would call the
 * curried version like csum(1)(2)(3), csum(1)(2,3), csum(1,2)(3), or csum(1,2,3). All these
 * methods of calling the curried function should return the same value as the original.
 */

/**
 * @param {Function} fn
 * @return {Function}
 */
var curry = function(fn) {
  return function curried(...args) {
    if (args.length >= fn.length) {
      return fn(...args);
    }
    return (...nextArgs) => curried(...args, ...nextArgs);
  };
};
```

2633 Convert Object To Json String

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2633. Convert Object to JSON String
 * https://leetcode.com/problems/convert-object-to-json-string/
 * Difficulty: Medium
 *
 * Given a value, return a valid JSON string of that value. The value can be a string, number,
 * array, object, boolean, or null. The returned string should not include extra spaces. The
 * order of keys should be the same as the order returned by Object.keys().
 *
 * Please solve it without using the built-in JSON.stringify method.
 */

/**
 * @param {null|boolean|number|string|Array|Object} object
 * @return {string}
 */
var jsonStringify = function(object) {
  if (object === null) return 'null';
  if (typeof object === 'boolean' || typeof object === 'number') return String(object);
  if (typeof object === 'string') return `"${object}"`;

  if (Array.isArray(object)) {
    const elements = object.map(item => jsonStringify(item));
    return `[${elements.join(',')}]`;
  }

  const pairs = Object.keys(object).map(key => `"${key}":${jsonStringify(object[key])}`);
```

```
  return `{${pairs.join(',')}}`;
};
```

2634 Filter Elements From Array

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2634. Filter Elements from Array
 * https://leetcode.com/problems/filter-elements-from-array/
 * Difficulty: Easy
 *
 * Given an integer array arr and a filtering function fn, return a filtered array
filteredArr.
 *
 * The fn function takes one or two arguments:
 * arr[i] - number from the arr
 * i - index of arr[i]
 *
 * filteredArr should only contain the elements from the arr for which the expression
 * fn(arr[i], i) evaluates to a truthy value. A truthy value is a value where
 * Boolean(value) returns true.
 *
 * Please solve it without the built-in Array.filter method.
 */

/**
 * @param {number[]} arr
 * @param {Function} fn
 * @return {number[]}
 */
var filter = function(arr, fn) {
  const result = [];

  for (let i = 0; i < arr.length; i++) {
    if (fn(arr[i], i)) {
      result.push(arr[i]);
    }
  }

  return result;
};
```

2635 Apply Transform Over Each Element In Array

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2635. Apply Transform Over Each Element in Array
 * https://leetcode.com/problems/apply-transform-over-each-element-in-array/
 * Difficulty: Easy
 *
 * Given an integer array arr and a mapping function fn, return a new array with a
transformation
 * applied to each element.
 *
 * The returned array should be created such that returnedArray[i] = fn(arr[i], i).
 *
 * Please solve it without the built-in Array.map method.
 */

/**
 * @param {number[]} arr
 * @param {Function} fn
 * @return {number[]}
```

```
 */
var map = function(arr, fn) {
  const result = [];

  for (let i = 0; i < arr.length; i++) {
    result.push(fn(arr[i], i));
  }

  return result;
};
```

2636 Promise Pool

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2636. Promise Pool
 * https://leetcode.com/problems/promise-pool/
 * Difficulty: Medium
 *
 * Given an array of asynchronous functions functions and a pool limit n, return an
asynchronous
 * function promisePool. It should return a promise that resolves when all the input functions
 * resolve.
 *
 * Pool limit is defined as the maximum number promises that can be pending at once.
promisePool
 * should begin execution of as many functions as possible and continue executing new
functions
 * when old promises resolve. promisePool should execute functions[i] then functions[i + 1]
then
 * functions[i + 2], etc. When the last promise resolves, promisePool should also resolve.
 *
 * For example, if n = 1, promisePool will execute one function at a time in series. However,
 * if n = 2, it first executes two functions. When either of the two functions resolve, a 3rd
 * function should be executed (if available), and so on until there are no functions left to
 * execute.
 *
 * You can assume all functions never reject. It is acceptable for promisePool to return a
promise
 * that resolves any value.
 */

/**
 * @param {Function[]} functions
 * @param {number} n
 * @return {Promise<any>}
 */
var promisePool = async function(functions, n) {
  const next = () => functions[n++]?.().then(next);
  return Promise.all(functions.slice(0, n).map(f => f().then(next)));
};
```

2637 Promise Time Limit

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2637. Promise Time Limit
 * https://leetcode.com/problems/promise-time-limit/
 * Difficulty: Medium
 *
 * Given an asynchronous function fn and a time t in milliseconds, return a new time limited
 * version of the input function. fn takes arguments provided to the time limited function.
 *
```

```
 * The time limited function should follow these rules:
 * - If the fn completes within the time limit of t milliseconds, the time limited function
 *   should resolve with the result.
 * - If the execution of the fn exceeds the time limit, the time limited function should
 *   reject with the string "Time Limit Exceeded".
 */

/**
 * @param {Function} fn
 * @param {number} t
 * @return {Function}
 */
var timeLimit = function(fn, t) {
  return async function(...args) {
    return Promise.race([
      fn(...args),
      new Promise((_, reject) => setTimeout(() => reject('Time Limit Exceeded'), t)),
    ]);
  };
};
```

2638 Count The Number Of K Free Subsets

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2638. Count the Number of K-Free Subsets
 * https://leetcode.com/problems/count-the-number-of-k-free-subsets/
 * Difficulty: Medium
 *
 * You are given an integer array nums, which contains distinct elements and an integer k.
 *
 * A subset is called a k-Free subset if it contains no two elements with an absolute
 * difference equal to k. Notice that the empty set is a k-Free subset.
 *
 * Return the number of k-Free subsets of nums.
 *
 * A subset of an array is a selection of elements (possibly none) of the array.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var countTheNumOfKFreeSubsets = function(nums, k) {

  while (next) {
    yield current;
    [current, next] = [next, current + next];
  }
};
```

2649 Nested Array Generator

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2649. Nested Array Generator
 * https://leetcode.com/problems/nested-array-generator/
 * Difficulty: Medium
 *
 * Given a multi-dimensional array of integers, return a generator object which yields
 * integers in the same order as inorder traversal.
 *
 * A multi-dimensional array is a recursive data structure that contains both integers
 * and other multi-dimensional arrays.
 *
 * inorder traversal iterates over each array from left to right, yielding any integers
 * it encounters or applying inorder traversal to any arrays it encounters.
 */

/**
 * @param {Array} input
 * @return {Generator}
 */
var inorderTraversal = function* (input) {
  for (const item of input) {
    if (!Array.isArray(item)) yield item;
    else yield* inorderTraversal(item);
  }
};
```

2650 Design Cancellable Function

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2650. Design Cancellable Function
 * https://leetcode.com/problems/design-cancellable-function/
 * Difficulty: Hard
 *
 * Sometimes you have a long running task, and you may wish to cancel it before it completes.
 * To help with this goal, write a function cancellable that accepts a generator object and
 * returns an array of two values: a cancel function and a promise.
 *
 * You may assume the generator function will only yield promises. It is your function's
 * responsibility to pass the values resolved by the promise back to the generator. If the
 * promise rejects, your function should throw that error back to the generator.
 *
 * If the cancel callback is called before the generator is done, your function should throw
 * an error back to the generator. That error should be the string "Cancelled" (Not an Error
 * object). If the error was caught, the returned promise should resolve with the next value
 * that was yielded or returned. Otherwise, the promise should reject with the thrown error.
 * No more code should be executed.
 *
 * When the generator is done, the promise your function returned should resolve the value
 * the generator returned. If, however, the generator throws an error, the returned promise
 * should reject with the error.
 */

/**
 * @param {Generator} generator
 * @return {[Function, Promise]}
 */
var cancellable = function(generator) {
  let cancel;
  const cancelPromise = new Promise((_, reject) => {
    cancel = () => reject("Cancelled");
  });
  cancelPromise.catch(() => {});
  const promise = (async () => {
    let next = generator.next();
    while (!next.done) {
      try {
        next = generator.next(await Promise.race([next.value, cancelPromise]));
      } catch (e) {
        next = generator.throw(e);
      }
    }
    return next.value;
  })();
  return [cancel, promise];
};
```

2651 Calculate Delayed Arrival Time

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2651. Calculate Delayed Arrival Time
 * https://leetcode.com/problems/calculate-delayed-arrival-time/
 * Difficulty: Easy
 *
 * You are given a positive integer arrivalTime denoting the arrival time of a train in
 * hours, and another positive integer delayedTime denoting the amount of delay in hours.
 *
 * Return the time when the train will arrive at the station.
```

```
 *
 * Note that the time in this problem is in 24-hours format.
 */

/**
 * @param {number} arrivalTime
 * @param {number} delayedTime
 * @return {number}
 */
var findDelayedArrivalTime = function(arrivalTime, delayedTime) {
  return (arrivalTime + delayedTime) % 24;
};
```

2652 Sum Multiples

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2652. Sum Multiples
 * https://leetcode.com/problems/sum-multiples/
 * Difficulty: Easy
 *
 * Given a positive integer n, find the sum of all integers in the range [1, n] inclusive
 * that are divisible by 3, 5, or 7.
 *
 * Return an integer denoting the sum of all numbers in the given range satisfying the
constraint.
 */

/**
 * @param {number} n
 * @return {number}
 */
var sumOfMultiples = function(n) {
  return sumDivisibleBy(3) + sumDivisibleBy(5) + sumDivisibleBy(7)
    - sumDivisibleBy(15) - sumDivisibleBy(21) - sumDivisibleBy(35)
    + sumDivisibleBy(105);

  function sumDivisibleBy(divisor) {
    const count = Math.floor(n / divisor);
    return divisor * count * (count + 1) / 2;
  }
};
```

2655 Find Maximal Uncovered Ranges

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2655. Find Maximal Uncovered Ranges
 * https://leetcode.com/problems/find-maximal-uncovered-ranges/
 * Difficulty: Medium
 *
 * You are given an integer n which is the length of a 0-indexed array nums, and a 0-indexed
 * 2D-array ranges, which is a list of sub-ranges of nums (sub-ranges may overlap).
 *
 * Each row ranges[i] has exactly 2 cells:
 * - ranges[i][0], which shows the start of the ith range (inclusive)
 * - ranges[i][1], which shows the end of the ith range (inclusive)
 *
 * These ranges cover some cells of nums and leave some cells uncovered. Your task is to find
 * all of the uncovered ranges with maximal length.
 *
 * Return a 2D-array answer of the uncovered ranges, sorted by the starting point in ascending
 * order.
```

```
 *
 * By all of the uncovered ranges with maximal length, we mean satisfying two conditions:
 * - Each uncovered cell should belong to exactly one sub-range
 * - There should not exist two ranges (l1, r1) and (l2, r2) such that r1 + 1 = l2
 */

/**
 * @param {number} n
 * @param {number[][]} ranges
 * @return {number[][]}
 */
var findMaximalUncoveredRanges = function(n, ranges) {
  if (ranges.length === 0) return [[0, n - 1]];

  ranges.sort((a, b) => a[0] - b[0]);

  const mergedRanges = [];
  let currentStart = ranges[0][0];
  let currentEnd = ranges[0][1];
  for (let i = 1; i < ranges.length; i++) {
    const [start, end] = ranges[i];
    if (start <= currentEnd + 1) {
      currentEnd = Math.max(currentEnd, end);
    } else {
      mergedRanges.push([currentStart, currentEnd]);
      currentStart = start;
      currentEnd = end;
    }
  }
  mergedRanges.push([currentStart, currentEnd]);

  const result = [];

  if (mergedRanges[0][0] > 0) {
    result.push([0, mergedRanges[0][0] - 1]);
  }

  for (let i = 0; i < mergedRanges.length - 1; i++) {
    const gapStart = mergedRanges[i][1] + 1;
    const gapEnd = mergedRanges[i + 1][0] - 1;
    if (gapStart <= gapEnd) {
      result.push([gapStart, gapEnd]);
    }
  }

  if (mergedRanges[mergedRanges.length - 1][1] < n - 1) {
    result.push([mergedRanges[mergedRanges.length - 1][1] + 1, n - 1]);
  }

  return result;
};
```

2656 Maximum Sum With Exactly K Elements

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2656. Maximum Sum With Exactly K Elements
 * https://leetcode.com/problems/maximum-sum-with-exactly-k-elements/
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums and an integer k. Your task is to perform
 * the following operation exactly k times in order to maximize your score:
 * 1. Select an element m from nums.
 * 2. Remove the selected element m from the array.
 * 3. Add a new element with a value of m + 1 to the array.
 * 4. Increase your score by m.
 *
 * Return the maximum score you can achieve after performing the operation exactly k times.
 */
```

```
/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var maximizeSum = function(nums, k) {
  return k * Math.max(...nums) + k * (k - 1) / 2;
};
```

2657 Find The Prefix Common Array Of Two Arrays

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2657. Find the Prefix Common Array of Two Arrays
 * https://leetcode.com/problems/find-the-prefix-common-array-of-two-arrays/
 * Difficulty: Medium
 *
 * You are given two 0-indexed integer permutations A and B of length n.
 *
 * A prefix common array of A and B is an array C such that C[i] is equal to the count of
 * numbers that are present at or before the index i in both A and B.
 *
 * Return the prefix common array of A and B.
 *
 * A sequence of n integers is called a permutation if it contains all integers from 1 to
 * n exactly once.
 */

/**
 * @param {number[]} A
 * @param {number[]} B
 * @return {number[]}
 */
var findThePrefixCommonArray = function(A, B) {
  const result = [];

  for (let i = 0, count = 0, set = new Set(); i < A.length; i++) {

    if (set.has(B[i])) count++;
    if (A[i] === B[i]) count++;
    [A[i], B[i]].forEach(n => set.add(n));
    result.push(count);
  }

  return result;
};
```

2658 Maximum Number Of Fish In A Grid

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2658. Maximum Number of Fish in a Grid
 * https://leetcode.com/problems/maximum-number-of-fish-in-a-grid/
 * Difficulty: Medium
 *
 * You are given a 0-indexed 2D matrix grid of size m x n, where (r, c) represents:
 * - A land cell if grid[r][c] = 0, or
 * - A water cell containing grid[r][c] fish, if grid[r][c] > 0.
 *
 * A fisher can start at any water cell (r, c) and can do the following operations
 * any number of times:
 * - Catch all the fish at cell (r, c), or
```

```
 * - Move to any adjacent water cell.
 *
 * Return the maximum number of fish the fisher can catch if he chooses his starting
 * cell optimally, or 0 if no water cell exists.
 *
 * An adjacent cell of the cell (r, c), is one of the cells (r, c + 1), (r, c - 1),
 * (r + 1, c) or (r - 1, c) if it exists.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var findMaxFish = function(grid) {

    secondHalfEnd = secondHalfEnd.next;
  }

  firstHalfEnd.next = list;
  secondHalfEnd.next = secondHalfStart;

  return [list, secondHalfStart];
};
```

2675 Array Of Objects To Matrix

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2675. Array of Objects to Matrix
 * https://leetcode.com/problems/array-of-objects-to-matrix/
 * Difficulty: Hard
 *
 * Write a function that converts an array of objects arr into a matrix m.
 *
 * arr is an array of objects or arrays. Each item in the array can be deeply nested with
child
 * arrays and child objects. It can also contain numbers, strings, booleans, and null values.
 *
 * The first row m should be the column names. If there is no nesting, the column names are
the
 * unique keys within the objects. If there is nesting, the column names are the respective
paths
 * in the object separated by ".".
 *
 * Each of the remaining rows corresponds to an object in arr. Each value in the matrix
corresponds
 * to a value in an object. If a given object doesn't contain a value for a given column, the
cell
 * should contain an empty string "".
```

```
 *
 * The columns in the matrix should be in lexographically ascending order.
 */

/**
 * @param {Array} arr
 * @return {(string | number | boolean | null)[][]}
 */
var jsonToMatrix = function(arr) {

2676 Throttle

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2676. Throttle
 * https://leetcode.com/problems/throttle/
 * Difficulty: Medium
 *
 * Given a function fn and a time in milliseconds t, return a throttled version of that
 * function.
 *
 * A throttled function is first called without delay and then, for a time interval of
 * t milliseconds, can't be executed but should store the latest function arguments provided
 * to call fn with them after the end of the delay.
 *
 * For instance, t = 50ms, and the function was called at 30ms, 40ms, and 60ms.
 *
 * At 30ms, without delay, the throttled function fn should be called with the arguments,
 * and calling the throttled function fn should be blocked for the following t milliseconds.
 *
 * At 40ms, the function should just save arguments.
```

```
 *
 * At 60ms, arguments should overwrite currently stored arguments from the second call because
 * the second and third calls are made before 80ms. Once the delay has passed, the throttled
 * function fn should be called with the latest arguments provided during the delay period,
 * and it should also create another delay period of 80ms + t.
 */

/**
 * @param {Function} fn
 * @param {number} t
 * @return {Function}
 */
var throttle = function(fn, t) {
  let isThrottled = false;
  let nextArgs = null;

      nextArgs = null;
      setTimeout(invoke, t);
    } else {
      isThrottled = false;
    }
  }

  return function(...args) {
    if (isThrottled) {
      nextArgs = args;
      return;
    }

    fn(...args);
    isThrottled = true;
    setTimeout(invoke, t);
  };
};
```

2677 Chunk Array

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2677. Chunk Array
 * https://leetcode.com/problems/chunk-array/
 * Difficulty: Easy
 *
 * Given an array arr and a chunk size size, return a chunked array.
 *
 * A chunked array contains the original elements in arr, but consists of subarrays each of
 * length size. The length of the last subarray may be less than size if arr.length is not
 * evenly divisible by size.
 *
 * You may assume the array is the output of JSON.parse. In other words, it is valid JSON.
 *
 * Please solve it without using lodash's _.chunk function.
 */

/**
 * @param {Array} arr
 * @param {number} size
 * @return {Array}
 */
var chunk = function(arr, size) {
  var result = [];

  for (let index = 0; index < arr.length;) {
    result.push(arr.slice(index, index + size));
    index += size;
  }
```

```
  return result;
};
```

2678 Number Of Senior Citizens

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2678. Number of Senior Citizens
 * https://leetcode.com/problems/number-of-senior-citizens/
 * Difficulty: Easy
 *
 * You are given a 0-indexed array of strings details. Each element of details provides
 * information about a given passenger compressed into a string of length 15. The system
 * is such that:
 * - The first ten characters consist of the phone number of passengers.
 * - The next character denotes the gender of the person.
 * - The following two characters are used to indicate the age of the person.
 * - The last two characters determine the seat allotted to that person.
 *
 * Return the number of passengers who are strictly more than 60 years old.
 */

/**
 * @param {string[]} details
 * @return {number}
 */
var countSeniors = function(details) {
  let result = 0;

  for (const detail of details) {
    const age = parseInt(detail.slice(11, 13));
    if (age > 60) result++;
  }

  return result;
};
```

2680 Maximum Or

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2680. Maximum OR
 * https://leetcode.com/problems/maximum-or/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums of length n and an integer k. In an operation,
 * you can choose an element and multiply it by 2.
 *
 * Return the maximum possible value of nums[0] | nums[1] | ... | nums[n - 1] that can be
obtained
 * after applying the operation on nums at most k times.
 *
 * Note that a | b denotes the bitwise or between two integers a and b.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var maximumOr = function(nums, k) {
  const n = nums.length;
```

```
  const prefixOr = new Array(n + 1).fill(0n);
  const suffixOr = new Array(n + 1).fill(0n);

  for (let i = 0; i < n; i++) {
    prefixOr[i + 1] = prefixOr[i] | BigInt(nums[i]);
  }

  for (let i = n - 1; i >= 0; i--) {
    suffixOr[i] = suffixOr[i + 1] | BigInt(nums[i]);
  }

  let maxOr = 0n;
  for (let i = 0; i < n; i++) {
    maxOr = maxOr > (prefixOr[i] | (BigInt(nums[i]) << BigInt(k)) | suffixOr[i + 1])
      ? maxOr
      : (prefixOr[i] | (BigInt(nums[i]) << BigInt(k)) | suffixOr[i + 1]);
  }

  return Number(maxOr);
};
```

2682 Find The Losers Of The Circular Game

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2682. Find the Losers of the Circular Game
 * https://leetcode.com/problems/find-the-losers-of-the-circular-game/
 * Difficulty: Easy
 *
 * There are n friends that are playing a game. The friends are sitting in a circle and are
numbered
 * from 1 to n in clockwise order. More formally, moving clockwise from the ith friend brings
you to
 * the (i+1)th friend for 1 <= i < n, and moving clockwise from the nth friend brings you to
the 1st
 * friend.
 *
 * The rules of the game are as follows:
 *
 * 1st friend receives the ball.
 * - After that, 1st friend passes it to the friend who is k steps away from them in the
clockwise
 *   direction.
 * - After that, the friend who receives the ball should pass it to the friend who is 2 * k
steps
 *   away from them in the clockwise direction.
 * - After that, the friend who receives the ball should pass it to the friend who is 3 * k
steps
 *   away from them in the clockwise direction, and so on and so forth.
 *
 * In other words, on the ith turn, the friend holding the ball should pass it to the friend
who
 * is i * k steps away from them in the clockwise direction.
 *
 * The game is finished when some friend receives the ball for the second time.
 *
 * The losers of the game are friends who did not receive the ball in the entire game.
 *
 * Given the number of friends, n, and an integer k, return the array answer, which contains
the
 * losers of the game in the ascending order.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {number[]}
 */
```

```
var circularGameLosers = function(n, k) {
  const visited = new Set();
  let current = 0;
  let step = 1;

  while (!visited.has(current)) {
    visited.add(current);
    current = (current + step * k) % n;
    step++;
  }

  const result = [];
  for (let i = 0; i < n; i++) {
    if (!visited.has(i)) {
      result.push(i + 1);
    }
  }

  return result;
};
```

2683 Neighboring Bitwise Xor

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2683. Neighboring Bitwise XOR
 * https://leetcode.com/problems/neighboring-bitwise-xor/
 * Difficulty: Medium
 *
 * A 0-indexed array derived with length n is derived by computing the bitwise XOR (⊕)
 * of adjacent values in a binary array original of length n.
 *
 * Specifically, for each index i in the range [0, n - 1]:
 * - If i = n - 1, then derived[i] = original[i] ⊕ original[0].
 * - Otherwise, derived[i] = original[i] ⊕ original[i + 1].
 *
 * Given an array derived, your task is to determine whether there exists a valid binary
 * array original that could have formed derived.
 *
 * Return true if such an array exists or false otherwise.
 * - A binary array is an array containing only 0's and 1's
 */

/**
 * @param {number[]} derived
 * @return {boolean}
 */
var doesValidArrayExist = function(derived) {
  return derived.reduce((xor, n) => xor ^ n, 0) === 0;
};
```

2684 Maximum Number Of Moves In A Grid

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2684. Maximum Number of Moves in a Grid
 * https://leetcode.com/problems/maximum-number-of-moves-in-a-grid/
 * Difficulty: Medium
 *
 * You are given a 0-indexed m x n matrix grid consisting of positive integers.
 *
 * You can start at any cell in the first column of the matrix, and traverse the grid in the
 * following way:
```

```
 * - From a cell (row, col), you can move to any of the cells: (row - 1, col + 1), (row, col +
 1)
 *   and (row + 1, col + 1) such that the value of the cell you move to, should be strictly
bigger
 *   than the value of the current cell.
 *
 * Return the maximum number of moves that you can perform.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */

    }
  }

  return result;
};
```

2689 Extract Kth Character From The Rope Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2689. Extract Kth Character From The Rope Tree
 * https://leetcode.com/problems/extract-kth-character-from-the-rope-tree/
 * Difficulty: Easy
 *
 * You are given the root of a binary tree and an integer k. Besides the left and right
children,
 * every node of this tree has two other properties, a string node.val containing only
lowercase
 * English letters (possibly empty) and a non-negative integer node.len. There are two types
of
 * nodes in this tree:
 * - Leaf: These nodes have no children, node.len = 0, and node.val is some non-empty string.
 * - Internal: These nodes have at least one child (also at most two children), node.len > 0,
```

```
 *   and node.val is an empty string.
 *
 * The tree described above is called a Rope binary tree. Now we define S[node] recursively
 * as follows:
 * - If node is some leaf node, S[node] = node.val,
 * - Otherwise if node is some internal node, S[node] = concat(S[node.left], S[node.right])
 *   and S[node].length = node.len.
 *
 * Return k-th character of the string S[root].
 *
 * Note: If s and p are two strings, concat(s, p) is a string obtained by concatenating p to
s.
 * For example, concat("ab", "zz") = "abzz".
 */

/**
 * Definition for a rope tree node.
 * class RopeTreeNode {
 *     constructor(len, val, left, right) {
 *         this.len = (len===undefined ? 0 : len);
 *         this.val = (val===undefined ? "" : val);
 *         this.left = (left===undefined ? null : left);
 *         this.right = (right===undefined ? null : right);
 *     }
 * }
 */
/**
 * @param {RopeTreeNode} root
 * @param {number} k
 * @return {character}
 */
var getKthCharacter = function(root, k) {
  if (!root.left && !root.right) {
    return root.val[k - 1];
  }

  const leftLength = getSubtreeLength(root.left);

  if (k <= leftLength) {
    return getKthCharacter(root.left, k);
  } else {
    return getKthCharacter(root.right, k - leftLength);
  }

  function getSubtreeLength(node) {
    if (!node) return 0;
    if (!node.left && !node.right) {
      return node.val.length;
    }
    return node.len;
  }
};
```

2690 Infinite Method Object

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2690. Infinite Method Object
 * https://leetcode.com/problems/infinite-method-object/
 * Difficulty: Easy
 *
 * Write a function that returns an infinite-method object.
 *
 * An infinite-method object is defined as an object that allows you to call any method and
 * it will always return the name of the method.
 *
 * For example, if you execute obj.abc123(), it will return "abc123".
 */
```

```
/**
 * @return {Object}
 */
var createInfiniteObject = function() {
  return new Proxy({}, {
    get(target, property) {
      return () => property;
    }
  });
};
```

2691 Immutability Helper

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2691. Immutability Helper
 * https://leetcode.com/problems/immutability-helper/
 * Difficulty: Hard
 *
 * Creating clones of immutable objects with minor alterations can be a tedious process.
 * Write a class ImmutableHelper that serves as a tool to help with this requirement.
 * The constructor accepts an immutable object obj which will be a JSON object or array.
 *
 * The class has a single method produce which accepts a function mutator. The function
 * returns a new object which is similar to the original except it has those mutations
applied.
 *
 * mutator accepts a proxied version of obj. A user of this function can (appear to) mutate
 * this object, but the original object obj should not actually be effected.
 *
 * For example, a user could write code like this:
 * const originalObj = {"x": 5};
 * const helper = new ImmutableHelper(originalObj);
 * const newObj = helper.produce((proxy) => {
 *   proxy.x = proxy.x + 1;
 * });
 * console.log(originalObj); // {"x": 5}
 * console.log(newObj); // {"x": 6}
 *
 * Properties of the mutator function:
 * - It will always return undefined.
 * - It will never access keys that don't exist.
 * - It will never delete keys (delete obj.key)
 * - It will never call methods on a proxied object (push, shift, etc).
 * - It will never set keys to objects (proxy.x = {})
 *
 * Note on how the solution will be tested: the solution validator will only analyze
differences
 * between what was returned and the original obj. Doing a full comparison would be too
 * computationally expensive. Also, any mutations to the original object will result in a
 * wrong answer.
 */

var ImmutableHelper = function(obj) {
  this.original = obj;
};

/**
 * @param {Function} mutator
 * @return {JSON} clone of obj
 */
ImmutableHelper.prototype.produce = function(mutator) {
  const mutated = { _: this.original };

  mutator(proxify(mutated, { _: this.original }, (field, value) => {
    mutated[field] = value;
    return mutated;
  })._);
```

```
  return mutated._;

  function proxify(mutableObj, originalObj, setter) {
    return new Proxy(mutableObj, {
      set(_, property, value) {
        mutableObj = setter(property, value);
      },

      get(_, property) {
        let value = mutableObj[property];

        if (!value || typeof value !== 'object') {
          return value;
        } else {
          return proxify(value, originalObj[property], (field, newValue) => {
            if (value === originalObj[property]) {
              mutableObj = setter(
                property,
                value = Array.isArray(value) ? [...value] : { ...value }
              );
            }
            value[field] = newValue;
            return value;
          });
        }
      }
    });
  }
};
```

2692 Make Object Immutable

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 2692. Make Object Immutable
 * https://leetcode.com/problems/make-object-immutable/
 * Difficulty: Medium
 *
 * Write a function that takes an object obj and returns a new immutable version of this
object.
 *
 * An immutable object is an object that can't be altered and will throw an error if any
attempt
 * is made to alter it.
 *
 * There are three types of error messages that can be produced from this new object.
 * - Attempting to modify a key on the object will result in this error message:
 *   - `Error Modifying: ${key}`.
 * - Attempting to modify an index on an array will result in this error message:
 *   - `Error Modifying Index: ${index}`.
 * - Attempting to call a method that mutates an array will result in this error message:
 *   - `Error Calling Method: ${methodName}`.
 *   - You may assume the only methods that can mutate an array
 *     are ['pop', 'push', 'shift', 'unshift', 'splice', 'sort', 'reverse'].
 *
 * obj is a valid JSON object or array, meaning it is the output of JSON.parse().
 *
 * Note that a string literal should be thrown, not an Error.
 */

/**
 * @param {Object|Array} obj
 * @return {Object|Array} immutable obj
 */
var makeImmutable = function(obj) {
  const mutatingMethods = new Set(['pop', 'push', 'shift', 'unshift', 'splice', 'sort',
'reverse']);

  return new Proxy(obj, {
```

```
    set(target, key) {
      if (Array.isArray(target)) {
        throw `Error Modifying Index: ${key}`;
      }
      throw `Error Modifying: ${key}`;
    },

    get(target, key) {
      const value = target[key];

      if (typeof value === 'object' && value !== null) {
        return makeImmutable(value);
      }

      if (typeof value === 'function') {
        return new Proxy(value, {
          apply(...args) {
            if (mutatingMethods.has(key)) {
              throw `Error Calling Method: ${key}`;
            }
            return Reflect.apply(...args);
          }
        });
      }

      return value;
    }
  });
};
```

2693 Call Function With Custom Context

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2693. Call Function with Custom Context
 * https://leetcode.com/problems/call-function-with-custom-context/
 * Difficulty: Medium
 *
 * Enhance all functions to have the callPolyfill method. The method accepts an object obj as
 * its first parameter and any number of additional arguments. The obj becomes the this
context
 * for the function. The additional arguments are passed to the function (that the
callPolyfill
 * method belongs on).
 *
 * For example if you had the function:
 *
 * function tax(price, taxRate) {
 *   const totalCost = price * (1 + taxRate);
 *   console.log(`The cost of ${this.item} is ${totalCost}`);
 * }
 *
 * Calling this function like tax(10, 0.1) will log "The cost of undefined is 11". This is
 * because the this context was not defined.
 *
 * However, calling the function like tax.callPolyfill({item: "salad"}, 10, 0.1) will log "The
 * cost of salad is 11". The this context was appropriately set, and the function logged an
 * appropriate output.
 *
 * Please solve this without using the built-in Function.call method.
 */

/**
 * @param {Object} context
 * @param {Array} args
 * @return {null|boolean|number|string|Array|Object}
 */
Function.prototype.callPolyfill = function(context, ...args) {
  return this.bind(context)(...args);
```

```
}
```

2694 Event Emitter

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 2694. Event Emitter
 * https://leetcode.com/problems/event-emitter/
 * Difficulty: Medium
 *
 * Design an EventEmitter class. This interface is similar (but with some differences) to the
one
 * found in Node.js or the Event Target interface of the DOM. The EventEmitter should allow
for
 * subscribing to events and emitting them.
 *
 * Your EventEmitter class should have the following two methods:
 * - subscribe - This method takes in two arguments: the name of an event as a string and a
callback
 *   function. This callback function will later be called when the event is emitted.
 *   An event should be able to have multiple listeners for the same event. When emitting an
event
 *   with multiple callbacks, each should be called in the order in which they were
subscribed.
 *   An array of results should be returned. You can assume no callbacks passed to subscribe
are
 *   referentially identical.
 *   The subscribe method should also return an object with an unsubscribe method that enables
 the
 *   user to unsubscribe. When it is called, the callback should be removed from the list of
 *   subscriptions and undefined should be returned.
 * - emit - This method takes in two arguments: the name of an event as a string and an
optional
 *   array of arguments that will be passed to the callback(s). If there are no callbacks
subscribed
 *   to the given event, return an empty array. Otherwise, return an array of the results of
all
 *   callback calls in the order they were subscribed.
 */

class EventEmitter {
  constructor() {
    this.events = new Map();
  }

  /**
   * @param {string} eventName
   * @param {Function} callback
   * @return {Object}
   */
  subscribe(eventName, callback) {
    if (!this.events.has(eventName)) {
      this.events.set(eventName, []);
    }

    const listeners = this.events.get(eventName);
    listeners.push(callback);

    return {
      unsubscribe: () => {
        const index = listeners.indexOf(callback);
        if (index !== -1) {
          listeners.splice(index, 1);
        }
      }
    };
  }

  /**
```

```
   * @param {string} eventName
   * @param {Array} args
   * @return {Array}
   */
  emit(eventName, args = []) {
    if (!this.events.has(eventName)) {
      return [];
    }

    return this.events.get(eventName).map(listener => listener(...args));
  }
}
```

2695 Array Wrapper

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2695. Array Wrapper
 * https://leetcode.com/problems/array-wrapper/
 * Difficulty: Easy
 *
 * Create a class ArrayWrapper that accepts an array of integers in its constructor.
 *
 * This class should have two features:
 * - When two instances of this class are added together with the + operator, the resulting
 *   value is the sum of all the elements in both arrays.
 * - When the String() function is called on the instance, it will return a comma separated
 *   string surrounded by brackets. For example, [1,2,3].
 */

/**
 * @param {number[]} nums
 * @return {void}
 */
var ArrayWrapper = function(nums) {
  this.nums = nums;
};

/**
 * @return {number}
 */
ArrayWrapper.prototype.valueOf = function() {
  return this.nums.reduce((sum, n) => sum + n, 0);
};

/**
 * @return {string}
 */
ArrayWrapper.prototype.toString = function() {
  return JSON.stringify(this.nums);
};
```

2696 Minimum String Length After Removing Substrings

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2696. Minimum String Length After Removing Substrings
 * https://leetcode.com/problems/minimum-string-length-after-removing-substrings/
 * Difficulty: Easy
 *
 * You are given a string s consisting only of uppercase English letters.
 *
 * You can apply some operations to this string where, in one operation, you can remove any
```

```
 * occurrence of one of the substrings "AB" or "CD" from s.
 *
 * Return the minimum possible length of the resulting string that you can obtain.
 *
 * Note that the string concatenates after removing the substring and could produce new "AB"
 * or "CD" substrings.
 */

/**
 * @param {string} s
 * @return {number}
 */
var minLength = function(s) {
  const stack = [];

  for (const char of s) {
    if (stack.length && ((stack[stack.length - 1] === 'A' && char === 'B')
        || (stack[stack.length - 1] === 'C' && char === 'D'))) {
      stack.pop();
    } else {
      stack.push(char);
    }
  }

  return stack.length;
};
```

2697 Lexicographically Smallest Palindrome

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2697. Lexicographically Smallest Palindrome
 * https://leetcode.com/problems/lexicographically-smallest-palindrome/
 * Difficulty: Easy
 *
 * You are given a string s consisting of lowercase English letters, and you are allowed to
 * perform operations on it. In one operation, you can replace a character in s with another
 * lowercase English letter.
 *
 * Your task is to make s a palindrome with the minimum number of operations possible. If
there
 * are multiple palindromes that can be made using the minimum number of operations, make the
 * lexicographically smallest one.
 *
 * A string a is lexicographically smaller than a string b (of the same length) if in the
first
 * position where a and b differ, string a has a letter that appears earlier in the alphabet
 * than the corresponding letter in b.
 *
 * Return the resulting palindrome string.
 */

/**
 * @param {string} s
 * @return {string}
 */
var makeSmallestPalindrome = function(s) {
  const chars = s.split('');
  let left = 0;
  let right = s.length - 1;

  while (left < right) {
    if (chars[left] !== chars[right]) {
      chars[left] = chars[right] = chars[left] < chars[right] ? chars[left] : chars[right];
    }
    left++;
    right--;
  }
```

```
  return chars.join('');
};
```

2698 Find The Punishment Number Of An Integer

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2698. Find the Punishment Number of an Integer
 * https://leetcode.com/problems/find-the-punishment-number-of-an-integer/
 * Difficulty: Medium
 *
 * Given a positive integer n, return the punishment number of n.
 *
 * The punishment number of n is defined as the sum of the squares of all integers i such
that:
 * - 1 <= i <= n
 * - The decimal representation of i * i can be partitioned into contiguous substrings such
that
 *   the sum of the integer values of these substrings equals i.
 */

/**
 * @param {number} n
 * @return {number}
 */
var punishmentNumber = function(n) {
  function canPartition(num, target, start) {
    if (!target && start === num.length) {
      return true;
    } else if (start >= num.length) {
      return false;
    }
    for (let i = start, sum = 0; i < num.length; i++) {
      sum = sum * 10 + +num[i];
      if (sum > target) {
        break;
      } else if (canPartition(num, target - sum, i + 1)) {
        return true;
      }
    }

    return false;
  }

  let result = 0;
  for (let i = 1; i <= n; i++) {

      result += i * i;
    }
  }

  return result;
};
```

2700 Differences Between Two Objects

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2700. Differences Between Two Objects
 * https://leetcode.com/problems/differences-between-two-objects/
 * Difficulty: Medium
 *
 * Write a function that accepts two deeply nested objects or arrays obj1 and obj2 and returns
```

```
 * a new object representing their differences.
 *
 * The function should compare the properties of the two objects and identify any changes.
 * The returned object should only contains keys where the value is different from obj1 to
obj2.
 *
 * For each changed key, the value should be represented as an array [obj1 value, obj2 value].
 * Keys that exist in one object but not in the other should not be included in the returned
 * object. The end result should be a deeply nested object where each leaf value is a
 * difference array.
 *
 * When comparing two arrays, the indices of the arrays are considered to be their keys.
 *
 * You may assume that both objects are the output of JSON.parse.
 */

/**
 * @param {Object|Array} obj1
 * @param {Object|Array} obj2
 * @return {Object|Array}
 */
function objDiff(obj1, obj2) {
  if (obj1 === obj2) return {};

  if (obj1 === null || obj2 === null || typeof obj1 !== typeof obj2
    || typeof obj1 !== 'object') {

        totalExtraNeeded += extraNeeded;
      }
    }

    return totalExtraNeeded <= operations;
  }
};
```

2703 Return Length Of Arguments Passed

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2703. Return Length of Arguments Passed
 * https://leetcode.com/problems/return-length-of-arguments-passed/
 * Difficulty: Easy
 *
 * Write a function argumentsLength that returns the count of arguments passed to it.
 */

/**
 * @param {...(null|boolean|number|string|Array|Object)} args
 * @return {number}
 */
var argumentsLength = function(...args) {
  return args.length;
};
```

2704 To Be Or Not To Be

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2704. To Be Or Not To Be
 * https://leetcode.com/problems/to-be-or-not-to-be/
 * Difficulty: Easy
 *
 * Write a function expect that helps developers test their code. It should take in any
 * value val and return an object with the following two functions.
 *
 * - toBe(val) accepts another value and returns true if the two values === each other.
 *   If they are not equal, it should throw an error "Not Equal".
```

```
 * - notToBe(val) accepts another value and returns true if the two values !== each
 *   other. If they are equal, it should throw an error "Equal".
 */

/**
 * @param {string} val
 * @return {Object}
 */
var expect = function(val) {
  const compareHelper = (error, fn) => {
    if (fn()) throw new Error(error);
    return true;
  };
  return {
    toBe: input => compareHelper('Not Equal', () => input !== val),
    notToBe: input => compareHelper('Equal', () => input === val),
  };
};
```

2705 Compact Object

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2705. Compact Object
 * https://leetcode.com/problems/compact-object/
 * Difficulty: Medium
 *
 * Given an object or array obj, return a compact object.
 *
 * A compact object is the same as the original object, except with keys containing falsy
 * values removed. This operation applies to the object and any nested objects. Arrays are
 * considered objects where the indices are keys. A value is considered falsy when
 * Boolean(value) returns false.
 *
 * You may assume the obj is the output of JSON.parse. In other words, it is valid JSON.
 */

/**
 * @param {Object|Array} obj
 * @return {Object|Array}
 */

  if (obj === null) return null;
  if (Array.isArray(obj)) return obj.filter(Boolean).map(compactObject);
  if (typeof obj !== 'object') return obj;

  return Object.keys(obj).reduce((result, key) => {
    const value = compactObject(obj[key]);
    if (value) {
      result[key] = value;
    }
    return result;
  }, {});
};
```

2706 Buy Two Chocolates

EASY

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2706. Buy Two Chocolates
 * https://leetcode.com/problems/buy-two-chocolates/
 * Difficulty: Easy
 *
```

```
 * You are given an integer array prices representing the prices of various chocolates in
 * a store. You are also given a single integer money, which represents your initial amount
 * of money.
 *
 * You must buy exactly two chocolates in such a way that you still have some non-negative
 * leftover money. You would like to minimize the sum of the prices of the two chocolates
 * you buy.
 *
 * Return the amount of money you will have leftover after buying the two chocolates. If
 * there is no way for you to buy two chocolates without ending up in debt, return money.
 * Note that the leftover must be non-negative.
 */

/**
 * @param {number[]} prices
 * @param {number} money
 * @return {number}
 */
var buyChoco = function(prices, money) {
  prices.sort((a, b) => a - b);
  const minCost = prices[0] + prices[1];
  return minCost <= money ? money - minCost : money;
};
```

2707 Extra Characters In A String

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```

2710 Remove Trailing Zeros From A String

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2710. Remove Trailing Zeros From a String
 * https://leetcode.com/problems/remove-trailing-zeros-from-a-string/
 * Difficulty: Easy
 *
 * Given a positive integer num represented as a string, return the integer num without
 * trailing zeros as a string.
 */

/**
 * @param {string} num
 * @return {string}
 */
var removeTrailingZeros = function(num) {
  return num.replace(/0+$/g, '');
};
```

2711 Difference Of Number Of Distinct Values On Diagonals

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2711. Difference of Number of Distinct Values on Diagonals
 * https://leetcode.com/problems/difference-of-number-of-distinct-values-on-diagonals/
 * Difficulty: Medium
 *
 * Given a 2D grid of size m x n, you should find the matrix answer of size m x n.
 *
 * The cell answer[r][c] is calculated by looking at the diagonal values of the cell
grid[r][c]:
 * - Let leftAbove[r][c] be the number of distinct values on the diagonal to the left and
above
 *   the cell grid[r][c] not including the cell grid[r][c] itself.
 * - Let rightBelow[r][c] be the number of distinct values on the diagonal to the right and
below
 *   the cell grid[r][c], not including the cell grid[r][c] itself.
 * - Then answer[r][c] = |leftAbove[r][c] - rightBelow[r][c]|.
 *
 * A matrix diagonal is a diagonal line of cells starting from some cell in either the topmost
 * row or leftmost column and going in the bottom-right direction until the end of the matrix
 * is reached.
 *
 * - For example, in the below diagram the diagonal is highlighted using the cell with indices
 *   (2, 3) colored gray:
```

```
 *   - Red-colored cells are left and above the cell.
 *   - Blue-colored cells are right and below the cell.
 */

/**
 * @param {number[][]} grid
 * @return {number[][]}
 */
var differenceOfDistinctValues = function(grid) {
  const rows = grid.length;
  const cols = grid[0].length;
  const result = Array.from({ length: rows }, () => new Array(cols).fill(0));

    for (const [neighbor, weight] of graph[node]) {
      const newDist = currentDist + weight;
      if (newDist < dist[neighbor][hopsLeft]) {
        dist[neighbor][hopsLeft] = newDist;
        pq.enqueue([newDist, hopsLeft, neighbor]);
      }

      if (hopsLeft > 0 && currentDist < dist[neighbor][hopsLeft - 1]) {
        dist[neighbor][hopsLeft - 1] = currentDist;
        pq.enqueue([currentDist, hopsLeft - 1, neighbor]);
      }
    }
  }

  return -1;
};
```

2715 Timeout Cancellation

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2715. Timeout Cancellation
 * https://leetcode.com/problems/timeout-cancellation/
 * Difficulty: Easy
 *
 * Given a function fn, an array of arguments args, and a timeout t in milliseconds,
 * return a cancel function cancelFn.
 *
 * After a delay of cancelTimeMs, the returned cancel function cancelFn will be invoked.
 * > setTimeout(cancelFn, cancelTimeMs)
 *
 * Initially, the execution of the function fn should be delayed by t milliseconds.
 *
 * If, before the delay of t milliseconds, the function cancelFn is invoked, it should
 * cancel the delayed execution of fn. Otherwise, if cancelFn is not invoked within the
 * specified delay t, fn should be executed with the provided args as arguments.
 */

/**
 * @param {Function} fn
 * @param {Array} args
 * @param {number} t
 * @return {Function}
 */
var cancellable = function(fn, args, t) {
  const timeoutId = setTimeout(() => fn(...args), t);
  return () => clearTimeout(timeoutId);
};
```

2716 Minimize String Length

EASY

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 2716. Minimize String Length
 * https://leetcode.com/problems/minimize-string-length/
 * Difficulty: Easy
 *
 * Given a string s, you have two types of operation:
 * 1. Choose an index i in the string, and let c be the character in position i. Delete the
 *    closest occurrence of c to the left of i (if exists).
 * 2. Choose an index i in the string, and let c be the character in position i. Delete the
 *    closest occurrence of c to the right of i (if exists).
 *
 * Your task is to minimize the length of s by performing the above operations zero or more
times.
 *
 * Return an integer denoting the length of the minimized string.
 */

/**
 * @param {string} s
 * @return {number}
 */
var minimizedStringLength = function(s) {
  return new Set(s).size;
};
```

2717 Semi Ordered Permutation

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2717. Semi-Ordered Permutation
 * https://leetcode.com/problems/semi-ordered-permutation/
 * Difficulty: Easy
 *
 * You are given a 0-indexed permutation of n integers nums.
 *
 * A permutation is called semi-ordered if the first number equals 1 and the last number
equals n.
 * You can perform the below operation as many times as you want until you make nums a
semi-ordered
 * permutation:
 * - Pick two adjacent elements in nums, then swap them.
 *
 * Return the minimum number of operations to make nums a semi-ordered permutation.
 *
 * A permutation is a sequence of integers from 1 to n of length n containing each number
exactly
 * once.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var semiOrderedPermutation = function(nums) {
  let oneIndex = 0;
  let nIndex = 0;

  for (let i = 0; i < nums.length; i++) {
    if (nums[i] === 1) oneIndex = i;
    if (nums[i] === nums.length) nIndex = i;
  }

  return oneIndex + (nums.length - 1 - nIndex) - (oneIndex > nIndex ? 1 : 0);
};
```

2721 Execute Asynchronous Functions In Parallel

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2721. Execute Asynchronous Functions in Parallel
 * https://leetcode.com/problems/execute-asynchronous-functions-in-parallel/
 * Difficulty: Medium
 *
 * Given an array of asynchronous functions functions, return a new promise promise.
 * Each function in the array accepts no arguments and returns a promise. All the
 * promises should be executed in parallel.
 *
 * promise resolves:
 * - When all the promises returned from functions were resolved successfully in
 * parallel. The resolved value of promise should be an array of all the resolved
 * values of promises in the same order as they were in the functions. The promise
 * should resolve when all the asynchronous functions in the array have completed
 * execution in parallel.
 *
 * promise rejects:
 * When any of the promises returned from functions were rejected. promise should
 * also reject with the reason of the first rejection.
 *
```

```
 * Please solve it without using the built-in Promise.all function.
 */

/**
 * @param {Array<Function>} functions
 * @return {Promise<any>}
 */
var promiseAll = function(functions) {
  return new Promise((resolve, reject) => {
    const promises = new Array(functions.length);
    let count = 0;
    functions.forEach((fn, i) => {
      fn().then(result => {
        promises[i] = result;
        if (++count === promises.length) {
          resolve(promises);
        }
      }).catch(reject);
    });
  });
};
```

2722 Join Two Arrays By Id

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2722. Join Two Arrays by ID
 * https://leetcode.com/problems/join-two-arrays-by-id/
 * Difficulty: Medium
 *
 * Given two arrays arr1 and arr2, return a new array joinedArray. All the objects in each
 * of the two inputs arrays will contain an id field that has an integer value.
 *
 * joinedArray is an array formed by merging arr1 and arr2 based on their id key. The length
 * of joinedArray should be the length of unique values of id. The returned array should be
 * sorted in ascending order based on the id key.
 *
 * If a given id exists in one array but not the other, the single object with that id should
 * be included in the result array without modification.
 *
 * If two objects share an id, their properties should be merged into a single object:
 * - If a key only exists in one object, that single key-value pair should be included in
 *   the object.
 * - If a key is included in both objects, the value in the object from arr2 should override
 *   the value from arr1.
 */

/**
 * @param {Array} arr1
 * @param {Array} arr2
 * @return {Array}
 */
var join = function(arr1, arr2) {
  const map = new Map();
  [...arr1, ...arr2].forEach(obj => map.set(obj.id, { ...map.get(obj.id), ...obj }));
  return Array.from(map.values()).sort((a, b) => a.id - b.id);
};
```

2723 Add Two Promises

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2723. Add Two Promises
```

```
 * https://leetcode.com/problems/add-two-promises/
 * Difficulty: Easy
 *
 * Given two promises promise1 and promise2, return a new promise. promise1 and promise2
 * will both resolve with a number. The returned promise should resolve with the sum of
 * the two numbers.
 */

/**
 * @param {Promise} promise1
 * @param {Promise} promise2
 * @return {Promise}
 */
var addTwoPromises = async function(promise1, promise2) {
  return Promise.all([promise1, promise2]).then(([a, b]) => a + b);
};
```

2724 Sort By

EASY

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2724. Sort By
 * https://leetcode.com/problems/sort-by/
 * Difficulty: Easy
 *
 * Given an array arr and a function fn, return a sorted array sortedArr.
 * You can assume fn only returns numbers and those numbers determine the
 * sort order of sortedArr. sortedArr must be sorted in ascending order
 * by fn output.
 *
 * You may assume that fn will never duplicate numbers for a given array.
 */

/**
 * @param {Array} arr
 * @param {Function} fn
 * @return {Array}
 */
var sortBy = function(arr, fn) {
  return arr.sort((a, b) => fn(a) - fn(b));
};
```

2725 Interval Cancellation

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2725. Interval Cancellation
 * https://leetcode.com/problems/interval-cancellation/
 * Difficulty: Easy
 *
 * Given a function fn, an array of arguments args, and an interval time t, return a cancel
 * function cancelFn.
 *
 * After a delay of cancelTimeMs, the returned cancel function cancelFn will be invoked.
 * > setTimeout(cancelFn, cancelTimeMs)
 *
 * The function fn should be called with args immediately and then called again every t
 * milliseconds until cancelFn is called at cancelTimeMs ms.
 */

/**
 * @param {Function} fn
 * @param {Array} args
```

```
 * @param {number} t
 * @return {Function}
 */
var cancellable = function(fn, args, t) {
  fn(...args);
  const timer = setInterval(() => fn(...args), t);
  return () => clearInterval(timer);
};
```

2726 Calculator With Method Chaining

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2726. Calculator with Method Chaining
 * https://leetcode.com/problems/calculator-with-method-chaining/
 * Difficulty: Easy
 *
 * Design a Calculator class. The class should provide the mathematical operations of
addition,
 * subtraction, multiplication, division, and exponentiation. It should also allow consecutive
 * operations to be performed using method chaining. The Calculator class constructor should
 * accept a number which serves as the initial value of result.
 *
 * Your Calculator class should have the following methods:
 * - add - This method adds the given number value to the result and returns the updated
Calculator.
 * - subtract - This method subtracts the given number value from the result and returns the
 *   updated Calculator.
 * - multiply - This method multiplies the result  by the given number value and returns the
 *   updated Calculator.
 * - divide - This method divides the result by the given number value and returns the updated
 *   Calculator. If the passed value is 0, an error "Division by zero is not allowed" should
 *   be thrown.
 * - power - This method raises the result to the power of the given number value and returns
 *   the updated Calculator.
 * - getResult - This method returns the result.
 *
 * Solutions within 10-5 of the actual result are considered correct.
 */

class Calculator {
  /**
   * @param {number} value
   */
  constructor(value) {
    this.value = value;
  }

  /**
   * @param {number} value
   * @return {Calculator}
   */
  add(value) {
    this.value += value;
    return this;
  }

  /**
   * @param {number} value
   * @return {Calculator}
   */
  subtract(value) {
    this.value -= value;
    return this;
  }

  /**
   * @param {number} value
   * @return {Calculator}
```

```
   */
  multiply(value) {
    this.value *= value;
    return this;
  }

  /**
   * @param {number} value
   * @return {Calculator}
   */
  divide(value) {
    if (value === 0) {
      throw new Error('Division by zero is not allowed');
    }
    this.value /= value;
    return this;
  }

  /**
   * @param {number} value
   * @return {Calculator}
   */
  power(value) {
    this.value **= value;
    return this;
  }

  /**
   * @return {number}
   */
  getResult() {
    return this.value;
  }
}
```

2727 Is Object Empty

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2727. Is Object Empty
 * https://leetcode.com/problems/is-object-empty/
 * Difficulty: Easy
 *
 * Given an object or an array, return if it is empty.
 *
 * - An empty object contains no key-value pairs.
 * - An empty array contains no elements.
 *
 * You may assume the object or array is the output of JSON.parse.
 */

/**
 * @param {Object|Array} obj
 * @return {boolean}
 */
var isEmpty = function(obj) {
  return !Object.keys(obj).length;
};
```

2728 Count Houses In A Circular Street

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 2728. Count Houses in a Circular Street
 * https://leetcode.com/problems/count-houses-in-a-circular-street/
 * Difficulty: Easy
 *
 * You are given an object street of class Street that represents a circular street and a
positive
 * integer k which represents a maximum bound for the number of houses in that street (in
other
 * words, the number of houses is less than or equal to k). Houses' doors could be open or
closed
 * initially.
 *
 * Initially, you are standing in front of a door to a house on this street. Your task is to
count
 * the number of houses in the street.
 *
 * The class Street contains the following functions which may help you:
 * - void openDoor(): Open the door of the house you are in front of.
 * - void closeDoor(): Close the door of the house you are in front of.
 * - boolean isDoorOpen(): Returns true if the door of the current house is open and false
 *   otherwise.
 * - void moveRight(): Move to the right house.
 * - void moveLeft(): Move to the left house.
 *
 * Return ans which represents the number of houses on this street.
 */

/**
 * Definition for a street.
 * class Street {
 *     @param {number[]} doors
 *     constructor(doors);
 *
 *     @return {void}
 *     openDoor();
 *
 *     @return {void}
 *     closeDoor();
 *
 *     @return {boolean}
 *     isDoorOpen();
 *
 *     @return {void}
 *     moveRight();
 *
 *     @return {void}
 *     moveLeft();
 * }
 */
/**
 * @param {Street} street
 * @param {number} k
 * @return {number}
 */
var houseCount = function(street, k) {
  for (let i = 0; i < k; i++) {
    street.closeDoor();
    street.moveLeft();
  }

  street.openDoor();
  let count = 1;

  street.moveLeft();
  while (!street.isDoorOpen()) {
    street.moveLeft();
    count++;
  }

  return count;
};
```

2729 Check If The Number Is Fascinating

EASY

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 2729. Check if The Number is Fascinating
 * https://leetcode.com/problems/check-if-the-number-is-fascinating/
 * Difficulty: Easy
 *
 * You are given an integer n that consists of exactly 3 digits.
 *
 * We call the number n fascinating if, after the following modification, the resulting number
 * contains all the digits from 1 to 9 exactly once and does not contain any 0's:
 * - Concatenate n with the numbers 2 * n and 3 * n.
 *
 * Return true if n is fascinating, or false otherwise.
 *
 * Concatenating two numbers means joining them together. For example, the concatenation of
121
 * and 371 is 121371.
 */

/**
 * @param {number} n
 * @return {boolean}
 */
var isFascinating = function(n) {
  const concatenated = `${n}${2 * n}${3 * n}`;
  const digitSet = new Set(concatenated);
  return concatenated.length === 9 && digitSet.size === 9 && !digitSet.has('0');
};
```

2732 Find A Good Subset Of The Matrix

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2732. Find a Good Subset of the Matrix
 * https://leetcode.com/problems/find-a-good-subset-of-the-matrix/
 * Difficulty: Hard
 *
 * You are given a 0-indexed m x n binary matrix grid.
 *
 * Let us call a non-empty subset of rows good if the sum of each column of the subset is at
 * most half of the length of the subset.
 *
 * More formally, if the length of the chosen subset of rows is k, then the sum of each column
 * should be at most floor(k / 2).
 *
 * Return an integer array that contains row indices of a good subset sorted in ascending
order.
 *
 * If there are multiple good subsets, you can return any of them. If there are no good
subsets,
 * return an empty array.
 *
 * A subset of rows of the matrix grid is any matrix that can be obtained by deleting some
(possibly
 * none or all) rows from grid.
 */

/**
 * @param {number[][]} grid
 * @return {number[]}
 */
```

```
var goodSubsetofBinaryMatrix = function(grid) {
  const rows = grid.length;
  const cols = grid[0].length;
  const rowMasks = new Map();

  for (let i = 0; i < rows; i++) {
    let mask = 0;
    for (let j = 0; j < cols; j++) {
      mask |= grid[i][j] << j;
    }
    if (mask === 0) return [i];
    rowMasks.set(mask, i);
  }

  for (const [mask1, i] of rowMasks) {
    for (const [mask2, j] of rowMasks) {
      if ((mask1 & mask2) === 0) return [Math.min(i, j), Math.max(i, j)];
    }
  }

  return [];
};
```

2733 Neither Minimum Nor Maximum

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2733. Neither Minimum nor Maximum
 * https://leetcode.com/problems/neither-minimum-nor-maximum/
 * Difficulty: Easy
 *
 * Given an integer array nums containing distinct positive integers, find and return any
 * number from the array that is neither the minimum nor the maximum value in the array,
 * or -1 if there is no such number.
 *
 * Return the selected integer.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var findNonMinOrMax = function(nums) {
  if (nums.length < 3) return -1;
  const minVal = Math.min(nums[0], nums[1], nums[2]);
  const maxVal = Math.max(nums[0], nums[1], nums[2]);

  for (const num of [nums[0], nums[1], nums[2]]) {
    if (num !== minVal && num !== maxVal) return num;
  }

  return -1;
};
```

2737 Find The Closest Marked Node

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2737. Find the Closest Marked Node
 * https://leetcode.com/problems/find-the-closest-marked-node/
 * Difficulty: Medium
 *
```

```
 * You are given a positive integer n which is the number of nodes of a 0-indexed directed
 * weighted graph and a 0-indexed 2D array edges where edges[i] = [ui, vi, wi] indicates
 * that there is an edge from node ui to node vi with weight wi.
 *
 * You are also given a node s and a node array marked; your task is to find the minimum
 * distance from s to any of the nodes in marked.
 *
 * Return an integer denoting the minimum distance from s to any node in marked or -1 if
 * there are no paths from s to any of the marked nodes.
 */

/**
 * @param {number} n
 * @param {number[][]} edges
 * @param {number} s
 * @param {number[]} marked
 * @return {number}
 */
var minimumDistance = function(n, edges, s, marked) {
  const graph = new Array(n).fill().map(() => []);
  const markedSet = new Set(marked);

  for (const [u, v, w] of edges) {
    graph[u].push([v, w]);
  }

  const distances = new Array(n).fill(Infinity);
  const pq = new PriorityQueue((a, b) => a[0] - b[0]);

    }
  }

  return -1;
};
```

2739 Total Distance Traveled

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2739. Total Distance Traveled
 * https://leetcode.com/problems/total-distance-traveled/
 * Difficulty: Easy
 *
 * A truck has two fuel tanks. You are given two integers, mainTank representing the fuel
present
 * in the main tank in liters and additionalTank representing the fuel present in the
additional
 * tank in liters.
 *
 * The truck has a mileage of 10 km per liter. Whenever 5 liters of fuel get used up in the
main
 * tank, if the additional tank has at least 1 liters of fuel, 1 liters of fuel will be
```

```
transferred
 * from the additional tank to the main tank.
 *
 * Return the maximum distance which can be traveled.
 *
 * Note: Injection from the additional tank is not continuous. It happens suddenly and
immediately
 * for every 5 liters consumed.
 */

/**
 * @param {number} mainTank
 * @param {number} additionalTank
 * @return {number}
 */
var distanceTraveled = function(mainTank, additionalTank) {
  let distance = 0;
  let fuel = mainTank;

  while (fuel >= 5 && additionalTank > 0) {
    distance += 50;
    fuel -= 5;
    fuel += 1;
    additionalTank -= 1;
  }

  distance += fuel * 10;
  return distance;
};
```

2740 Find The Value Of The Partition

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2740. Find the Value of the Partition
 * https://leetcode.com/problems/find-the-value-of-the-partition/
 * Difficulty: Medium
 *
 * You are given a positive integer array nums.
 *
 * Partition nums into two arrays, nums1 and nums2, such that:
 * - Each element of the array nums belongs to either the array nums1 or the array nums2.
 * - Both arrays are non-empty.
 * - The value of the partition is minimized.
 *
 * The value of the partition is |max(nums1) - min(nums2)|.
 *
 * Here, max(nums1) denotes the maximum element of the array nums1, and min(nums2) denotes the
 * minimum element of the array nums2.
 *
 * Return the integer denoting the value of such partition.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var findValueOfPartition = function(nums) {
  nums.sort((a, b) => a - b);
  let result = Infinity;

  for (let i = 1; i < nums.length; i++) {
    result = Math.min(result, nums[i] - nums[i - 1]);
  }

  return result;
};
```

2742 Painting The Walls

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2742. Painting the Walls
 * https://leetcode.com/problems/painting-the-walls/
 * Difficulty: Hard
 *
 * You are given two 0-indexed integer arrays, cost and time, of size n representing the costs
 * and the time taken to paint n different walls respectively. There are two painters
available:
 * - A paid painter that paints the ith wall in time[i] units of time and takes cost[i] units
of
 *   money.
 * - A free painter that paints any wall in 1 unit of time at a cost of 0. But the free
painter
 *   can only be used if the paid painter is already occupied.
 *
 * Return the minimum amount of money required to paint the n walls.
 */

/**
 * @param {number[]} cost
 * @param {number[]} time
 * @return {number}
 */
var paintWalls = function(cost, time) {
  const n = cost.length;
  const dp = new Array(n + 1).fill().map(() => new Array(n + 1).fill(Infinity));

  for (let i = 0; i < n; i++) {
    for (let j = 0; j <= n; j++) {
      if (dp[i][j] === Infinity) continue;

      dp[i + 1][j] = Math.min(dp[i + 1][j], dp[i][j]);

      const walls = Math.min(n, j + time[i] + 1);
      dp[i + 1][walls] = Math.min(dp[i + 1][walls], dp[i][j] + cost[i]);
    }
  }

  return dp[n][n];
};
```

2743 Count Substrings Without Repeating Character

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2743. Count Substrings Without Repeating Character
 * https://leetcode.com/problems/count-substrings-without-repeating-character/
 * Difficulty: Medium
 *
 * You are given a string s consisting only of lowercase English letters. We call a substring
 * special if it contains no character which has occurred at least twice (in other words, it
 * does not contain a repeating character). Your task is to count the number of special
 * substrings. For example, in the string "pop", the substring "po" is a special substring,
 * however, "pop" is not special (since 'p' has occurred twice).
 *
 * Return the number of special substrings.
 *
```

```
 * A substring is a contiguous sequence of characters within a string. For example, "abc" is
 * a substring of "abcd", but "acd" is not.
 */

/**
 * @param {string} s
 * @return {number}
 */
var numberOfSpecialSubstrings = function(s) {
  const n = s.length;
  const map = new Map();
  let result = 0;
  let left = 0;

  for (let right = 0; right < n; right++) {
    const char = s[right];
    map.set(char, (map.get(char) || 0) + 1);

  }

  return result;
};
```

2744 Find Maximum Number Of String Pairs

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2744. Find Maximum Number of String Pairs
 * https://leetcode.com/problems/find-maximum-number-of-string-pairs/
 * Difficulty: Easy
 *
 * You are given a 0-indexed array words consisting of distinct strings.
 *
 * The string words[i] can be paired with the string words[j] if:
 * - The string words[i] is equal to the reversed string of words[j].
 * - 0 <= i < j < words.length.
 *
 * Return the maximum number of pairs that can be formed from the array words.
 *
 * Note that each string can belong in at most one pair.
 */

/**
 * @param {string[]} words
 * @return {number}
 */
var maximumNumberOfStringPairs = function(words) {
  const set = new Set();
  let result = 0;

  for (const word of words) {
    const reversed = word[1] + word[0];
    if (set.has(reversed)) {
      result++;
      set.delete(reversed);
    } else {
      set.add(word);
    }
  }
```

```
  return result;
};
```

2745 Construct The Longest New String

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2745. Construct the Longest New String
 * https://leetcode.com/problems/construct-the-longest-new-string/
 * Difficulty: Medium
 *
 * You are given three integers x, y, and z.
 *
 * You have x strings equal to "AA", y strings equal to "BB", and z strings equal to "AB". You
 * want to choose some (possibly all or none) of these strings and concatenate them in some
order
 * to form a new string. This new string must not contain "AAA" or "BBB" as a substring.
 *
 * Return the maximum possible length of the new string.
 *
 * A substring is a contiguous non-empty sequence of characters within a string.
 */

/**
 * @param {number} x
 * @param {number} y
 * @param {number} z
 * @return {number}
 */
var longestString = function(x, y, z) {
  const minPairs = Math.min(x, y);
  return 2 * (minPairs * 2 + (x > minPairs ? 1 : 0) + (y > minPairs ? 1 : 0) + z);
};
```

2748 Number Of Beautiful Pairs

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2748. Number of Beautiful Pairs
 * https://leetcode.com/problems/number-of-beautiful-pairs/
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums. A pair of indices i, j where
 * 0 <= i < j < nums.length is called beautiful if the first digit of nums[i] and
 * the last digit of nums[j] are coprime.
 *
 * Return the total number of beautiful pairs in nums.
 *
 * Two integers x and y are coprime if there is no integer greater than 1 that divides
 * both of them. In other words, x and y are coprime if gcd(x, y) == 1, where gcd(x, y)
 * is the greatest common divisor of x and y.
 */

    }
    return count;
  }
};
```

2751 Robot Collisions

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2751. Robot Collisions
 * https://leetcode.com/problems/robot-collisions/
 * Difficulty: Hard
 *
 * There are n 1-indexed robots, each having a position on a line, health, and movement
direction.
 *
 * You are given 0-indexed integer arrays positions, healths, and a string directions
(directions[i]
 * is either 'L' for left or 'R' for right). All integers in positions are unique.
 *
 * All robots start moving on the line simultaneously at the same speed in their given
directions.
 * If two robots ever share the same position while moving, they will collide.
 *
 * If two robots collide, the robot with lower health is removed from the line, and the health
 of
 * the other robot decreases by one. The surviving robot continues in the same direction it
was
 * going. If both robots have the same health, they are both removed from the line.
 *
 * Your task is to determine the health of the robots that survive the collisions, in the same
 * order that the robots were given, i.e. final health of robot 1 (if survived), final health
 * of robot 2 (if survived), and so on. If there are no survivors, return an empty array.
 *
 * Return an array containing the health of the remaining robots (in the order they were given
 * in the input), after no further collisions can occur.
 *
 * Note: The positions may be unsorted.
 */

/**
 * @param {number[]} positions
 * @param {number[]} healths
 * @param {string} directions
 * @return {number[]}
 */
var survivedRobotsHealths = function(positions, healths, directions) {

    result[robot.index] = robot.health;
  }

  return result.filter(health => health > 0);
};
```

2753 Count Houses In A Circular Street Ii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2753. Count Houses in a Circular Street II
 * https://leetcode.com/problems/count-houses-in-a-circular-street-ii/
 * Difficulty: Hard
 *
 * You are given an object street of class Street that represents a circular street and a
positive
 * integer k which represents a maximum bound for the number of houses in that street (in
other
 * words, the number of houses is less than or equal to k). Houses' doors could be open or
closed
 * initially (at least one is open).
 *
 * Initially, you are standing in front of a door to a house on this street. Your task is to
count
 * the number of houses in the street.
 *
 * The class Street contains the following functions which may help you:
 * - void closeDoor(): Close the door of the house you are in front of.
 * - boolean isDoorOpen(): Returns true if the door of the current house is open and false
 *   otherwise.
 * - void moveRight(): Move to the right house.
 *
 * Note that by circular street, we mean if you number the houses from 1 to n, then the right
house
 * of housei is housei+1 for i < n, and the right house of housen is house1.
 *
 * Return ans which represents the number of houses on this street.
 */

/**
 * Definition for a street.
 * class Street {
 *     @param {number[]} doors
 *     constructor(doors);
 *
 *     @return {void}
 *     closeDoor();
 *
 *     @return {boolean}
```

```
 *     isDoorOpen();
 *
 *     @return {void}
 *     moveRight();
 * }
 */
/**
 * @param {Street} street
 * @param {number} k
 * @return {number}
 */
var houseCount = function(street, k) {
  let result = 0;

  while (true) {
    tryMoveToOpen(street, k, true);
    const distance = tryMoveToOpen(street, k, false);

    }

    return moves;
  }
};
```

2754 Bind Function To Context

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2754. Bind Function to Context
 * https://leetcode.com/problems/bind-function-to-context/
 * Difficulty: Medium
 *
 * Enhance all functions to have the bindPolyfill method. When bindPolyfill is called with
 * a passed object obj, that object becomes the this context for the function.
 *
 * For example, if you had the code:
 * function f() {
 *   console.log('My context is ' + this.ctx);
 * }
 * f();
 *
 * The output would be "My context is undefined". However, if you bound the function:
 * function f() {
 *   console.log('My context is ' + this.ctx);
 * }
 * const boundFunc = f.boundPolyfill({ "ctx": "My Object" })
 * boundFunc();
 *
 * The output should be "My context is My Object".
 *
```

```
 * You may assume that a single non-null object will be passed to the bindPolyfill method.
 *
 * Please solve it without the built-in Function.bind method.
 */

/**
 * @param {Object} obj
 * @return {Function}
 */
Function.prototype.bindPolyfill = function(obj) {
  var fn = this;
  return function() {
    return fn.apply(obj, arguments);
  };
};
```

2755 Deep Merge Of Two Objects

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2755. Deep Merge of Two Objects
 * https://leetcode.com/problems/deep-merge-of-two-objects/
 * Difficulty: Medium
 *
 * Given two values obj1 and obj2, return a deepmerged value.
 *
 * Values should be deepmerged according to these rules:
 * - If the two values are objects, the resulting object should have all the keys that exist
 *   on either object. If a key belongs to both objects, deepmerge the two associated values.
 *   Otherwise, add the key-value pair to the resulting object.
 * - If the two values are arrays, the resulting array should be the same length as the longer
 *   array. Apply the same logic as you would with objects, but treat the indices as keys.
 * - Otherwise the resulting value is obj2.
 *
 * You can assume obj1 and obj2 are the output of JSON.parse().
 */

/**
 * @param {null|boolean|number|string|Array|Object} obj1
 * @param {null|boolean|number|string|Array|Object} obj2
 * @return {null|boolean|number|string|Array|Object}
 */

    const maxLength = Math.max(obj1.length, obj2.length);
    const result = [];

    for (let i = 0; i < maxLength; i++) {
      if (i < obj2.length) {
        result[i] = deepMerge(obj1[i], obj2[i]);
      } else {
        result[i] = obj1[i];
      }
    }

    return result;
  }
```

```
  const result = { ...obj1 };

  Object.keys(obj2).forEach(key => {
    result[key] = deepMerge(obj1[key], obj2[key]);
  });

  return result;
};
```

2756 Query Batching

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2756. Query Batching
 * https://leetcode.com/problems/query-batching/
 * Difficulty: Hard
 *
 * Batching multiple small queries into a single large query can be a useful optimization.
 * Write a class QueryBatcher that implements this functionality.
 *
 * The constructor should accept two parameters:
 * - An asynchronous function queryMultiple which accepts an array of string keys input. It
will
 *   resolve with an array of values that is the same length as the input array. Each index
 *   corresponds to the value associated with input[i]. You can assume the promise will never
 *   reject.
 * - A throttle time in milliseconds t.
 *
 * The class has a single method.
 * - async getValue(key). Accepts a single string key and resolves with a single string value.
 *   The keys passed to this function should eventually get passed to the queryMultiple
function.
 *   queryMultiple should never be called consecutively within t milliseconds. The first time
 *   getValue is called, queryMultiple should immediately be called with that single key.
 *   If after t milliseconds, getValue had been called again, all the passed keys should be
 *   passed to queryMultiple and ultimately returned. You can assume every key passed to this
 *   method is unique.
 *
 * The following diagram illustrates how the throttling algorithm works. Each rectangle
represents
 * 100ms. The throttle time is 400ms.
 */

/**
 * @param {Function} queryMultiple
 * @param {number} t
 * @return {void}
 */
var QueryBatcher = function(queryMultiple, t) {
  this.queryMultiple = queryMultiple;
  this.throttleTime = t;
  this.pendingRequests = [];
  this.batchTimer = null;
  this.lastExecutionTime = 0;
};

/**
 * @param {string} key
 * @return {Promise<string>}
 */
QueryBatcher.prototype.getValue = function(key) {
  return new Promise((resolve) => {
    const currentTime = Date.now();
    const timeSinceLastExecution = currentTime - this.lastExecutionTime;
    const remainingDelay = Math.max(0, this.throttleTime - timeSinceLastExecution);

    this.lastExecutionTime = currentTime + remainingDelay;
```

```
    this.pendingRequests.push({ key, resolve });

 * @return {Promise<void>}
 */
QueryBatcher.prototype.executeBatch = async function() {
  const currentBatch = this.pendingRequests.slice();
  this.pendingRequests = [];
  this.batchTimer = null;

  const keys = currentBatch.map((request) => request.key);
  const resolvers = currentBatch.map((request) => request.resolve);

  this.lastExecutionTime = Date.now();
  const results = await this.queryMultiple(keys);

  for (let i = 0; i < keys.length; i++) {
    resolvers[i](results[i]);
  }
};
```

2757 Generate Circular Array Values

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2757. Generate Circular Array Values
 * https://leetcode.com/problems/generate-circular-array-values/
 * Difficulty: Medium
 *
 * Given a circular array arr and an integer startIndex, return a generator object gen that
 * yields values from arr.
 *
 * The first time gen.next() is called on the generator, it should should yield
arr[startIndex].
 *
 * Each subsequent time gen.next() is called, an integer jump will be passed into the function
 * (Ex: gen.next(-3)).
 * - If jump is positive, the index should increase by that value, however if the current
index
 *   is the last index, it should instead jump to the first index.
 * - If jump is negative, the index should decrease by the magnitude of that value, however if
 *   the current index is the first index, it should instead jump to the last index.
 */

/**
 * @param {Array<number>} arr
 * @param {number} startIndex
 * @yields {number}
 */
var cycleGenerator = function* (arr, startIndex) {
  let currentIndex = startIndex;

  while (true) {
    const jump = yield arr[currentIndex];

    if (jump !== undefined) {
      currentIndex = ((currentIndex + jump) % arr.length + arr.length) % arr.length;
    }
  }
};
```

2758 Next Day

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2758. Next Day
 * https://leetcode.com/problems/next-day/
 * Difficulty: Easy
 *
 * Write code that enhances all date objects such that you can call the date.nextDay() method
 * on any date object and it will return the next day in the format YYYY-MM-DD as a string.
 */

2766 Relocate Marbles

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2766. Relocate Marbles
 * https://leetcode.com/problems/relocate-marbles/
 * Difficulty: Medium
 *
 * You are given a 0-indexed integer array nums representing the initial positions of some
 * marbles. You are also given two 0-indexed integer arrays moveFrom and moveTo of equal
length.
 *
 * Throughout moveFrom.length steps, you will change the positions of the marbles. On the ith
 * step, you will move all marbles at position moveFrom[i] to position moveTo[i].
 *
 * After completing all the steps, return the sorted list of occupied positions.
 *
 * Notes:
 * - We call a position occupied if there is at least one marble in that position.
 * - There may be multiple marbles in a single position.
 */

/**
 * @param {number[]} nums
 * @param {number[]} moveFrom
 * @param {number[]} moveTo
 * @return {number[]}
 */

```

2769 Find The Maximum Achievable Number

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2769. Find the Maximum Achievable Number
 * https://leetcode.com/problems/find-the-maximum-achievable-number/
 * Difficulty: Easy
 *
 * Given two integers, num and t. A number x is achievable if it can become equal to num
 * after applying the following operation at most t times:
 * - Increase or decrease x by 1, and simultaneously increase or decrease num by 1.
 *
 * Return the maximum possible value of x.
 */

/**
 * @param {number} num
 * @param {number} t
 * @return {number}
 */
var theMaximumAchievableX = function(num, t) {
  return num + 2 * t;
};
```

2773 Height Of Special Binary Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2773. Height of Special Binary Tree
 * https://leetcode.com/problems/height-of-special-binary-tree/
 * Difficulty: Medium
 *
 * You are given a root, which is the root of a special binary tree with n nodes. The nodes of
 * the special binary tree are numbered from 1 to n. Suppose the tree has k leaves in the
 * following order: b1 < b2 < ... < bk.
 *
 * The leaves of this tree have a special property! That is, for every leaf bi, the following
 * conditions hold:
 * - The right child of bi is bi + 1 if i < k, and b1 otherwise.
 * - The left child of bi is bi - 1 if i > 1, and bk otherwise.
 *
 * Return the height of the given tree.
 *
 * Note: The height of a binary tree is the length of the longest path from the root to any
 * other node.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number}

  }
```

```
  return 1 + Math.max(heightOfTree(root.left), heightOfTree(root.right));
};
```

2774 Array Upper Bound

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2774. Array Upper Bound
 * https://leetcode.com/problems/array-upper-bound/
 * Difficulty: Easy
 *
 * Write code that enhances all arrays such that you can call the upperBound() method on any
 * array and it will return the last index of a given target number. nums is a sorted
ascending
 * array of numbers that may contain duplicates. If the target number is not found in the
array,
 * return -1.
 */

/**
 * @param {number} target
 * @return {number}
 */
Array.prototype.upperBound = function(target) {
  let left = 0;
  let right = this.length - 1;
  let result = -1;

  while (left <= right) {
    const mid = Math.floor((left + right) / 2);

    if (this[mid] === target) {
      result = mid;
      left = mid + 1;
    } else if (this[mid] < target) {
      left = mid + 1;
    } else {
      right = mid - 1;
    }
  }

  return result;
};
```

2775 Undefined To Null

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2775. Undefined to Null
 * https://leetcode.com/problems/undefined-to-null/
 * Difficulty: Medium
 *
 * Given a deeply nested object or array obj, return the object obj with any undefined
 * values replaced by null.
 *
 * undefined values are handled differently than null values when objects are converted
 * to a JSON string using JSON.stringify(). This function helps ensure serialized data
 * is free of unexpected errors.
 */

/**
 * @param {Object|Array} obj
```

```
 * @return {Object|Array}
 */
var undefinedToNull = function(obj) {
  if (obj === undefined) {
    return null;
  }

  if (obj === null || typeof obj !== 'object') {
    return obj;
  }

  if (Array.isArray(obj)) {
    return obj.map(item => undefinedToNull(item));
  }

  const result = {};
  Object.keys(obj).forEach(key => {
    result[key] = undefinedToNull(obj[key]);
  });

  return result;
};
```

2776 Convert Callback Based Function To Promise Based Function

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2776. Convert Callback Based Function to Promise Based Function
 * https://leetcode.com/problems/convert-callback-based-function-to-promise-based-function/
 * Difficulty: Medium
 *
 * Write a function that accepts another function fn and converts the callback-based function
into
 * a promise-based function.
 *
 * The function fn takes a callback as its first argument, along with any additional arguments
 * args passed as separate inputs.
 *
 * The promisify function returns a new function that should return a promise. The promise
should
 * resolve with the argument passed as the first parameter of the callback when the callback
is
 * invoked without error, and reject with the error when the callback is called with an error
as
 * the second argument.
 *
 * The following is an example of a function that could be passed into promisify.
 * function sum(callback, a, b) {
 *   if (a < 0 || b < 0) {
 *     const err = Error('a and b must be positive');
 *     callback(undefined, err);
 *   } else {
 *     callback(a + b);
 *   }
 * }
 *
 * This is the equivalent code based on promises:
 *
 * async function sum(a, b) {
 *   if (a < 0 || b < 0) {
 *     throw Error('a and b must be positive');
 *   } else {
 *     return a + b;
 *   }
 * }
 * */

/**
 * @param {Function} fn
```

```
 * @return {Function<Promise<number>>}
 */
var promisify = function(fn) {
  return async function(...args) {
    return new Promise((resolve, reject) => {
      fn((result, error) => {
        if (error) {
          reject(error);
        } else {
          resolve(result);
        }
      }, ...args);
    });
  };
};
```

2777 Date Range Generator

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2777. Date Range Generator
 * https://leetcode.com/problems/date-range-generator/
 * Difficulty: Medium
 *
 * Given a start date start, an end date end, and a positive integer step, return a generator
 * object that yields dates in the range from start to end inclusive.
 *
 * The value of step indicates the number of days between consecutive yielded values.
 *
 * All yielded dates must be in the string format YYYY-MM-DD.
 */

/**
 * @param {string} start
 * @param {string} end
 * @param {number} step
 * @yields {string}
 */
var dateRangeGenerator = function* (start, end, step) {
  const startDate = new Date(start);
  const endDate = new Date(end);
  const currentDate = new Date(startDate);

  while (currentDate <= endDate) {
    yield currentDate.toISOString().split('T')[0];
    currentDate.setDate(currentDate.getDate() + step);
  }
};
```

2778 Sum Of Squares Of Special Elements

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2778. Sum of Squares of Special Elements
 * https://leetcode.com/problems/sum-of-squares-of-special-elements/
 * Difficulty: Easy
 *
 * You are given a 1-indexed integer array nums of length n.
 *
 * An element nums[i] of nums is called special if i divides n, i.e. n % i == 0.
 *
 * Return the sum of the squares of all special elements of nums.
 */
```

```
/**
 * @param {number[]} nums
 * @return {number}
 */
var sumOfSquares = function(nums) {
  const n = nums.length;
  let total = 0;

  for (let i = 1; i <= n; i++) {
    if (n % i === 0) {

    }
  }

  return total;
};
```

2779 Maximum Beauty Of An Array After Applying Operation

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2779. Maximum Beauty of an Array After Applying Operation
 * https://leetcode.com/problems/maximum-beauty-of-an-array-after-applying-operation/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array nums and a non-negative integer k.
 *
 * In one operation, you can do the following:
 * - Choose an index i that hasn't been chosen before from the range [0, nums.length - 1].
 * - Replace nums[i] with any integer from the range [nums[i] - k, nums[i] + k].
 *
 * The beauty of the array is the length of the longest subsequence consisting of equal
elements.
 *
 * Return the maximum possible beauty of the array nums after applying the operation any
number
 * of times.
 *
 * Note that you can apply the operation to each index only once.
 *
 * A subsequence of an array is a new array generated from the original array by deleting some
 * elements (possibly none) without changing the order of the remaining elements.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var maximumBeauty = function(nums, k) {
  nums.sort((a, b) => a - b);
  let result = 0;
  let left = 0;

  for (let right = 0; right < nums.length; right++) {
    while (nums[right] - nums[left] > 2 * k) {
      left++;
    }
    result = Math.max(result, right - left + 1);
  }

  return result;
};
```

2780 Minimum Index Of A Valid Split

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2780. Minimum Index of a Valid Split
 * https://leetcode.com/problems/minimum-index-of-a-valid-split/
 * Difficulty: Medium
 *
 * An element x of an integer array arr of length m is dominant if more than half the elements
 * of arr have a value of x.
 *
 * You are given a 0-indexed integer array nums of length n with one dominant element.
 *
 * You can split nums at an index i into two arrays nums[0, ..., i] and nums[i + 1, ..., n -
1],
 * but the split is only valid if:
 * - 0 <= i < n - 1
 * - nums[0, ..., i], and nums[i + 1, ..., n - 1] have the same dominant element.
 *
 * Here, nums[i, ..., j] denotes the subarray of nums starting at index i and ending at index
j,
 * both ends being inclusive. Particularly, if j < i then nums[i, ..., j] denotes an empty
subarray.
 *
 * Return the minimum index of a valid split. If no valid split exists, return -1.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var minimumIndex = function(nums) {
  const map = new Map();

  for (const num of nums) {
    map.set(num, (map.get(num) || 0) + 1);
  }

  let dominantElement;
  for (const [num, count] of map) {
    if (count * 2 > nums.length) {
      dominantElement = num;
      break;
    }
  }

  let leftCount = 0;

    leftCount += nums[i] === dominantElement ? 1 : 0;
    const rightCount = map.get(dominantElement) - leftCount;

    if (leftCount * 2 > i + 1 && rightCount * 2 > nums.length - i - 1) {
      return i;
    }
  }

  return -1;
};
```

2782 Number Of Unique Categories

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 2782. Number of Unique Categories
 * https://leetcode.com/problems/number-of-unique-categories/
 * Difficulty: Medium
 *
 * You are given an integer n and an object categoryHandler of class CategoryHandler.
 *
 * There are n elements, numbered from 0 to n - 1. Each element has a category, and your task
 * is to find the number of unique categories.
 *
 * The class CategoryHandler contains the following function, which may help you:
 * - boolean haveSameCategory(integer a, integer b): Returns true if a and b are in the same
 *   category and false otherwise. Also, if either a or b is not a valid number (i.e. it's
greater
 *   than or equal to nor less than 0), it returns false.
 *
 * Return the number of unique categories.
 */

/**
 * Definition for a category handler.
 * class CategoryHandler {
 *     @param {number[]} categories
 *     constructor(categories);
 *
 *     @param {number} a
 *     @param {number} b
 *     @return {boolean}
 *     haveSameCategory(a, b);
 * }
 */
/**
 * @param {number} n
 * @param {CategoryHandler} categoryHandler
 * @return {number}

  for (const num of nums) {
    if (num > n) return false;
    frequency[num]++;
  }

  for (let i = 1; i < n; i++) {
    if (frequency[i] !== 1) return false;
  }
  return frequency[n] === 2;
};
```

2785 Sort Vowels In A String

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2785. Sort Vowels in a String
 * https://leetcode.com/problems/sort-vowels-in-a-string/
 * Difficulty: Medium
 *
 * Given a 0-indexed string s, permute s to get a new string t such that:
 * - All consonants remain in their original places. More formally, if there is an index i
 *   with 0 <= i < s.length such that s[i] is a consonant, then t[i] = s[i].
 * - The vowels must be sorted in the nondecreasing order of their ASCII values. More
formally,
 *   for pairs of indices i, j with 0 <= i < j < s.length such that s[i] and s[j] are vowels,
 *   then t[i] must not have a higher ASCII value than t[j].
 *
 * Return the resulting string.
 *
 * The vowels are 'a', 'e', 'i', 'o', and 'u', and they can appear in lowercase or uppercase.
 * Consonants comprise all letters that are not vowels.
 */

/**
 * @param {string} s
 * @return {string}
 */
var sortVowels = function(s) {
  const vowels = new Set(['a', 'e', 'i', 'o', 'u', 'A', 'E', 'I', 'O', 'U']);
  const vowelChars = [];

  for (const char of s) {
    if (vowels.has(char)) {

  }

  return result;
};
```

2791 Count Paths That Can Form A Palindrome In A Tree

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2791. Count Paths That Can Form a Palindrome in a Tree
 * https://leetcode.com/problems/count-paths-that-can-form-a-palindrome-in-a-tree/
 * Difficulty: Hard
 *
 * You are given a tree (i.e. a connected, undirected graph that has no cycles) rooted at node
 * 0 consisting of n nodes numbered from 0 to n - 1. The tree is represented by a 0-indexed
 * array parent of size n, where parent[i] is the parent of node i. Since node 0 is the root,
 * parent[0] == -1.
 *
 * You are also given a string s of length n, where s[i] is the character assigned to the edge
 * between i and parent[i]. s[0] can be ignored.
 *
 * Return the number of pairs of nodes (u, v) such that u < v and the characters assigned to
edges
 * on the path from u to v can be rearranged to form a palindrome.
 *
 * A string is a palindrome when it reads the same backwards as forwards.
 */

/**
 * @param {number[]} parent
 * @param {string} s
 * @return {number}
 */
var countPalindromePaths = function(parent, s) {
  const n = parent.length;
  const graph = Array.from({ length: n }, () => []);
  for (let i = 1; i < n; i++) {
    graph[parent[i]].push(i);
  }

  const freq = new Map([[0, 1]]);
  let result = 0;

  dfs(0, 0);
  return result;

  function dfs(node, mask) {
    for (const child of graph[node]) {
      const newMask = mask ^ (1 << (s[child].charCodeAt(0) - 97));
      result += freq.get(newMask) || 0;
      for (let i = 0; i < 26; i++) {
        result += freq.get(newMask ^ (1 << i)) || 0;
      }
      freq.set(newMask, (freq.get(newMask) || 0) + 1);
      dfs(child, newMask);
    }
  }
};
```

2792 Count Nodes That Are Great Enough

HARD

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2792. Count Nodes That Are Great Enough
 * https://leetcode.com/problems/count-nodes-that-are-great-enough/
 * Difficulty: Hard
 *
 * You are given a root to a binary tree and an integer k. A node of this tree is called great
 * enough if the followings hold:
 * - Its subtree has at least k nodes.
 * - Its value is greater than the value of at least k nodes in its subtree.
 *
 * Return the number of nodes in this tree that are great enough.
 *
 * The node u is in the subtree of the node v, if u == v or v is an ancestor of u.
 */
```

```
/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} k
 * @return {number}
 */
var countGreatEnoughNodes = function(root, k) {
  let result = 0;

  dfs(root);

  return result;

  function dfs(node) {
    if (!node) return [];

    const leftValues = dfs(node.left);
    const rightValues = dfs(node.right);
    const combined = [...leftValues, ...rightValues].sort((a, b) => a - b).slice(0, k);

    if (combined.length >= k && combined[k - 1] < node.val) {
      result++;
    } else {
      combined.push(node.val);
    }

    return combined;
  }
};
```

2794 Create Object From Two Arrays

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2794. Create Object from Two Arrays
 * https://leetcode.com/problems/create-object-from-two-arrays/
 * Difficulty: Easy
 *
 * Given two arrays keysArr and valuesArr, return a new object obj. Each key-value pair in obj
 * should come from keysArr[i] and valuesArr[i].
 *
 * If a duplicate key exists at a previous index, that key-value should be excluded. In other
 * words, only the first key should be added to the object.
 *
 * If the key is not a string, it should be converted into a string by calling String() on it.
 */

/**
 * @param {Array} keysArr
 * @param {Array} valuesArr
 * @return {Object}
 */
var createObject = function(keysArr, valuesArr) {
  const result = {};

  for (let i = 0; i < keysArr.length; i++) {
    const stringKey = String(keysArr[i]);
    if (!(stringKey in result)) {
      result[stringKey] = valuesArr[i];
    }
  }
```

```
  return result;
};
```

2795 Parallel Execution Of Promises For Individual Results Retrieval

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2795. Parallel Execution of Promises for Individual Results Retrieval
 *
https://leetcode.com/problems/parallel-execution-of-promises-for-individual-results-retrieval/
 * Difficulty: Medium
 *
 * Given an array functions, return a promise promise. functions is an array of functions that
 * return promises fnPromise. Each fnPromise can be resolved or rejected.
 *
 * If fnPromise is resolved:
 *
 *     obj = { status: "fulfilled", value: resolved value}
 *
 * If fnPromise is rejected:
 *
 *     obj = { status: "rejected", reason: reason of rejection (catched error message)}
 *
 * The promise should resolve with an array of these objects obj. Each obj in the array should
 * correspond to the promises in the original array function, maintaining the same order.
 *
 * Try to implement it without using the built-in method Promise.allSettled().
 */

/**
 * @param {Array<Function>} functions
 * @return {Promise<Array>}
 */
var promiseAllSettled = function(functions) {
  return new Promise(resolve => {
    const results = new Array(functions.length);
    let completedCount = 0;

    functions.forEach((fn, index) => {
      fn().then(value => results[index] = { status: 'fulfilled', value })
        .catch(reason => results[index] = { status: 'rejected', reason })
        .finally(() => {
          completedCount++;
          if (completedCount === functions.length) {
            resolve(results);
          }
        });
    });
  });
};
```

2796 Repeat String

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2796. Repeat String
 * https://leetcode.com/problems/repeat-string/
 * Difficulty: Easy
 *
 * Write code that enhances all strings such that you can call the string.replicate(x) method
 * on any string and it will return repeated string x times.
 *
 * Try to implement it without using the built-in method string.repeat.
```

```
 */

/**
 * @param {number} times
 * @return {string}
 */
String.prototype.replicate = function(times) {
  let result = '';
  for (let i = 0; i < times; i++) {
    result += this;
  }
  return result;
};
```

2797 Partial Function With Placeholders

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2797. Partial Function with Placeholders
 * https://leetcode.com/problems/partial-function-with-placeholders/
 * Difficulty: Easy
 *
 * Given a function fn and an array args, return a function partialFn.
 *
 * Placeholders "_" in the args should be replaced with values from restArgs starting from
 * index 0. Any remaining values in the restArgs should be added at the end of the args.
 *
 * partialFn should return a result of fn. fn should be called with the elements of the
 * modified args passed as separate arguments.
 */

/**
 * @param {Function} fn
 * @param {Array} args
 * @return {Function}
 */
var partial = function(fn, args) {
  return function(...restArgs) {
    const finalArgs = [...args];
    let restIndex = 0;

    for (let i = 0; i < finalArgs.length; i++) {
      if (finalArgs[i] === '_' && restIndex < restArgs.length) {
        finalArgs[i] = restArgs[restIndex];
        restIndex++;
      }
    }

    while (restIndex < restArgs.length) {
      finalArgs.push(restArgs[restIndex]);
      restIndex++;
    }

    return fn(...finalArgs);
  };
};
```

2798 Number Of Employees Who Met The Target

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2798. Number of Employees Who Met the Target
 * https://leetcode.com/problems/number-of-employees-who-met-the-target/
```

```
 * Difficulty: Easy
 *
 * There are n employees in a company, numbered from 0 to n - 1. Each employee i has worked
 * for hours[i] hours in the company.
 *
 * The company requires each employee to work for at least target hours.
 *
 * You are given a 0-indexed array of non-negative integers hours of length n and a
non-negative
 * integer target.
 *
 * Return the integer denoting the number of employees who worked at least target hours.
 */

/**
 * @param {number[]} hours
 * @param {number} target
 * @return {number}
 */
var numberOfEmployeesWhoMetTarget = function(hours, target) {
  let count = 0;

  for (const hoursWorked of hours) {
    if (hoursWorked >= target) count++;
  }

  return count;
};
```

2799 Count Complete Subarrays In An Array

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2799. Count Complete Subarrays in an Array
 * https://leetcode.com/problems/count-complete-subarrays-in-an-array/
 * Difficulty: Medium
 *
 * You are given an array nums consisting of positive integers.
 *
 * We call a subarray of an array complete if the following condition is satisfied:
 * - The number of distinct elements in the subarray is equal to the number of distinct
 *   elements in the whole array.
 *
 * Return the number of complete subarrays.
 *
 * A subarray is a contiguous non-empty part of an array.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var countCompleteSubarrays = function(nums) {
  const totalDistinct = new Set(nums).size;
  const frequency = new Map();
  let completeCount = 0;
  let left = 0;

  for (let right = 0; right < nums.length; right++) {
    frequency.set(nums[right], (frequency.get(nums[right]) || 0) + 1);

    while (frequency.size === totalDistinct) {
      completeCount += nums.length - right;
      const leftNum = nums[left];
      frequency.set(leftNum, frequency.get(leftNum) - 1);
      if (frequency.get(leftNum) === 0) {
        frequency.delete(leftNum);
      }
      left++;
```

```
    }
  }

  return completeCount;
};
```

2802 Find The K Th Lucky Number

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2802. Find The K-th Lucky Number
 * https://leetcode.com/problems/find-the-k-th-lucky-number/
 * Difficulty: Medium
 *
 * We know that 4 and 7 are lucky digits. Also, a number is called lucky if it contains only
 * lucky digits.
 *
 * You are given an integer k, return the kth lucky number represented as a string.
 */

/**
 * @param {number} k
 * @return {string}
 */
var kthLuckyNumber = function(k) {
  let length = 1;
  let totalNumbers = 0;

  while (totalNumbers + Math.pow(2, length) < k) {
    totalNumbers += Math.pow(2, length);
    length++;
  }

  const position = k - totalNumbers;
  const binaryString = (position - 1).toString(2).padStart(length, '0');

  return binaryString.replace(/0/g, '4').replace(/1/g, '7');
};
```

2803 Factorial Generator

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2803. Factorial Generator
 * https://leetcode.com/problems/factorial-generator/
 * Difficulty: Easy
 *
 * Write a generator function that takes an integer n as an argument and returns a generator
 * object which yields the factorial sequence.
 *
 * The factorial sequence is defined by the relation n! = n * (n-1) * (n-2) * ... * 2 * 1.
 *
 * The factorial of 0 is defined as 1.
 */

/**
 * @param {number} n
 * @yields {number}
 */
function* factorial(n) {
  let currentFactorial = 1;

  for (let i = 1; i <= n; i++) {
```

```
    currentFactorial *= i;
    yield currentFactorial;
  }

  if (n === 0) {
    yield 1;
  }
}
```

2804 Array Prototype Foreach

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2804. Array Prototype ForEach
 * https://leetcode.com/problems/array-prototype-foreach/
 * Difficulty: Easy
 *
 * Write your version of method forEach that enhances all arrays such that you can call the
 * array.forEach(callback, context) method on any array and it will execute callback on each
 * element of the array. Method forEach should not return anything.
 *
 * callback accepts the following arguments:
 * - currentValue - represents the current element being processed in the array. It is the
 *   value of the element in the current iteration.
 * - index - represents the index of the current element being processed in the array.
 * - array - represents the array itself, allowing access to the entire array within the
 *   callback function.
 *
 * The context is the object that should be passed as the function context parameter to the
 * callback function, ensuring that the this keyword within the callback function refers to
 * this context object.
 *
 * Try to implement it without using the built-in array methods.
 */

/**
 * @param {Function} callback
 * @param {Object} context
 * @return {void}
 */
Array.prototype.forEach = function(callback, context) {
  for (let i = 0; i < this.length; i++) {
    callback.call(context, this[i], i, this);
  }
};
```

2805 Custom Interval

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 2805. Custom Interval
 * https://leetcode.com/problems/custom-interval/
 * Difficulty: Medium
 *
 * Function customInterval
 *
 * Given a function fn, a number delay and a number period, return a number id.
 *
 * customInterval is a function that should execute the provided function fn at intervals
based
 * on a linear pattern defined by the formula delay + period * count.
 *
 * The count in the formula represents the number of times the interval has been executed
```

```
 * starting from an initial value of 0.
 *
 * Function customClearInterval
 *
 * Given the id. id is the returned value from the function customInterval.
 *
 * customClearInterval should stop executing provided function fn at intervals.
 *
 * Note: The setTimeout and setInterval functions in Node.js return an object, not a number.
 */

const intervalMap = new Map();
let nextId = 1;

/**
 * @param {Function} fn
 * @param {number} delay
 * @param {number} period
 * @return {number} id
 */
function customInterval(fn, delay, period) {
  let count = 0;
  const id = nextId++;

  function scheduleNext() {
    const nextDelay = delay + period * count;
    const timeoutId = setTimeout(() => {
      fn();
      count++;
      scheduleNext();
    }, nextDelay);
    intervalMap.set(id, timeoutId);
  }

  scheduleNext();
  return id;
}

/**
 * @param {number} id
 * @return {void}
 */
function customClearInterval(id) {
  const timeoutId = intervalMap.get(id);
  if (timeoutId) {
    clearTimeout(timeoutId);
    intervalMap.delete(id);
  }
}
```

2806 Account Balance After Rounded Purchase

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2806. Account Balance After Rounded Purchase
 * https://leetcode.com/problems/account-balance-after-rounded-purchase/
 * Difficulty: Easy
 *
 * Initially, you have a bank account balance of 100 dollars.
 *
 * You are given an integer purchaseAmount representing the amount you will spend on a
purchase
 * in dollars, in other words, its price.
 *
 * When making the purchase, first the purchaseAmount is rounded to the nearest multiple of
10.
 * Let us call this value roundedAmount. Then, roundedAmount dollars are removed from your
bank
 * account.
```

```
 *
 * Return an integer denoting your final bank account balance after this purchase.
 *
 * Notes:
 * - 0 is considered to be a multiple of 10 in this problem.
 * - When rounding, 5 is rounded upward (5 is rounded to 10, 15 is rounded to 20, 25 to 30,
and
 *   so on).
 */

/**
 * @param {number} purchaseAmount
 * @return {number}
 */
var accountBalanceAfterPurchase = function(purchaseAmount) {
  return 100 - (Math.round(purchaseAmount / 10) * 10);
};
```

2807 Insert Greatest Common Divisors In Linked List

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2807. Insert Greatest Common Divisors in Linked List
 * https://leetcode.com/problems/insert-greatest-common-divisors-in-linked-list/
 * Difficulty: Medium
 *
 * Given the head of a linked list head, in which each node contains an integer value.
 *
 * Between every pair of adjacent nodes, insert a new node with a value equal to the greatest
 * common divisor of them.
 *
 * Return the linked list after insertion.
 *
 * The greatest common divisor of two numbers is the largest positive integer that evenly
 * divides both numbers.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {ListNode}
 */
var insertGreatestCommonDivisors = function(head) {

      result.push(char);
    }
  }

  return result.join('');
};
```

2814 Minimum Time Takes To Reach Destination Without Drowning

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2814. Minimum Time Takes to Reach Destination Without Drowning
 * https://leetcode.com/problems/minimum-time-takes-to-reach-destination-without-drowning/
 * Difficulty: Hard
 *
 * You are given an n * m 0-indexed grid of string land. Right now, you are standing at the
cell
 * that contains "S", and you want to get to the cell containing "D". There are three other
types
 * of cells in this land:
 * - ".": These cells are empty.
 * - "X": These cells are stone.
 * - "*": These cells are flooded.
 *
 * At each second, you can move to a cell that shares a side with your current cell (if it
exists).
 * Also, at each second, every empty cell that shares a side with a flooded cell becomes
flooded
 * as well.
 *
 * There are two problems ahead of your journey:
 * - You can't step on stone cells.
 * - You can't step on flooded cells since you will drown (also, you can't step on a cell that
 will
```

```
 *   be flooded at the same time as you step on it).
 *
 * Return the minimum time it takes you to reach the destination in seconds, or -1 if it is
 * impossible.
 *
 * Note that the destination will never be flooded.
 */

/**
 * @param {string[][]} land
 * @return {number}
 */
var minimumSeconds = function(land) {
  const rows = land.length;
  const cols = land[0].length;

2818 Apply Operations To Maximize Score

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2818. Apply Operations to Maximize Score
 * https://leetcode.com/problems/apply-operations-to-maximize-score/
 * Difficulty: Hard
 *
 * You are given an array nums of n positive integers and an integer k.
 *
 * Initially, you start with a score of 1. You have to maximize your score by applying the
following
 * operation at most k times:
 * - Choose any non-empty subarray nums[l, ..., r] that you haven't chosen previously.
 * - Choose an element x of nums[l, ..., r] with the highest prime score. If multiple such
elements
```

```
 *   exist, choose the one with the smallest index.
 * - Multiply your score by x.
 *
 * Here, nums[l, ..., r] denotes the subarray of nums starting at index l and ending at the
index
 * r, both ends being inclusive.
 *
 * The prime score of an integer x is equal to the number of distinct prime factors of x. For
 * example, the prime score of 300 is 3 since 300 = 2 * 2 * 3 * 5 * 5.
 *
 * Return the maximum possible score after applying at most k operations.
 *
 * Since the answer may be large, return it modulo 109 + 7.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */

2819 Minimum Relative Loss After Buying Chocolates

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2819. Minimum Relative Loss After Buying Chocolates
 * https://leetcode.com/problems/minimum-relative-loss-after-buying-chocolates/
 * Difficulty: Hard
 *
 * You are given an integer array prices, which shows the chocolate prices and a 2D integer
 * array queries, where queries[i] = [ki, mi].
 *
 * Alice and Bob went to buy some chocolates, and Alice suggested a way to pay for them, and
 * Bob agreed.
 *
 * The terms for each query are as follows:
 * - If the price of a chocolate is less than or equal to ki, Bob pays for it.
 * - Otherwise, Bob pays ki of it, and Alice pays the rest.
 *
 * Bob wants to select exactly mi chocolates such that his relative loss is minimized, more
 * formally, if, in total, Alice has paid ai and Bob has paid bi, Bob wants to minimize bi -
ai.
 *
 * Return an integer array ans where ans[i] is Bob's minimum relative loss possible for
queries[i].
 */

2821 Delay The Resolution Of Each Promise

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 2821. Delay the Resolution of Each Promise
 * https://leetcode.com/problems/delay-the-resolution-of-each-promise/
 * Difficulty: Medium
 *
 * Given an array functions and a number ms, return a new array of functions.
 * - functions is an array of functions that return promises.
 * - ms represents the delay duration in milliseconds. It determines the amount of time to
wait
 *   before resolving or rejecting each promise in the new array.
 *
 * Each function in the new array should return a promise that resolves or rejects after an
 * additional delay of ms milliseconds, preserving the order of the original functions array.
 *
 * The delayAll function should ensure that each promise from functions is executed with a
 * delay, forming the new array of functions returning delayed promises.
 */

/**
 * @param {Array<Function>} functions
 * @param {number} ms
 * @return {Array<Function>}
 */
var delayAll = function(functions, ms) {
  return functions.map(fn => {
    return async function() {

  }

  return result;
};
```

2846 Minimum Edge Weight Equilibrium Queries In A Tree

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 2846. Minimum Edge Weight Equilibrium Queries in a Tree
 * https://leetcode.com/problems/minimum-edge-weight-equilibrium-queries-in-a-tree/
 * Difficulty: Hard
 *
 * There is an undirected tree with n nodes labeled from 0 to n - 1. You are given the integer
 n and
 * a 2D integer array edges of length n - 1, where edges[i] = [ui, vi, wi] indicates that
there is
 * an edge between nodes ui and vi with weight wi in the tree.
 *
 * You are also given a 2D integer array queries of length m, where queries[i] = [ai, bi]. For
 each
 * query, find the minimum number of operations required to make the weight of every edge on
the
 * path from ai to bi equal. In one operation, you can choose any edge of the tree and change
its
 * weight to any value.
 *
 * Note that:
 * - Queries are independent of each other, meaning that the tree returns to its initial state
 on
 *   each new query.
 * - The path from ai to bi is a sequence of distinct nodes starting with node ai and ending
with
 *   node bi such that every two adjacent nodes in the sequence share an edge in the tree.
 *
 * Return an array answer of length m where answer[i] is the answer to the ith query.
 */

/**

    }

    result = Math.max(result, currentSum);
  }

  return result;
};
```

2868 The Wording Game

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2868. The Wording Game
 * https://leetcode.com/problems/the-wording-game/
 * Difficulty: Hard
 *
 * Alice and Bob each have a lexicographically sorted array of strings named a and b
respectively.
```

```
 *
 * They are playing a wording game with the following rules:
 * - On each turn, the current player should play a word from their list such that the new
word is
 *   closely greater than the last played word; then it's the other player's turn.
 * - If a player can't play a word on their turn, they lose.
 *
 * Alice starts the game by playing her lexicographically smallest word.
 *
 * Given a and b, return true if Alice can win knowing that both players play their best, and
 * false otherwise.
 *
 * A word w is closely greater than a word z if the following conditions are met:
 * - w is lexicographically greater than z.
 * - If w1 is the first letter of w and z1 is the first letter of z, w1 should either be equal
 *   to z1 or be the letter after z1 in the alphabet.
 * - For example, the word "care" is closely greater than "book" and "car", but is not closely
 *   greater than "ant" or "cook".
 *
 * A string s is lexicographically greater than a string t if in the first position where s
and
 * t differ, string s has a letter that appears later in the alphabet than the corresponding
 * letter in t. If the first min(s.length, t.length) characters do not differ, then the longer
 * string is the lexicographically greater one.
 */

/**
 * @param {string[]} a
 * @param {string[]} b
 * @return {boolean}
 */
var canAliceWin = function(a, b) {
  const dictionaries = [{}, {}];

  [a, b].forEach((words, playerIndex) => {

      consecutiveNegatives = 0;
    } else {
      consecutiveNegatives++;
      result.push(consecutiveNegatives <= seen.length ? seen[consecutiveNegatives - 1] : -1);
    }
  }

  return result;
};
```

2900 Longest Unequal Adjacent Groups Subsequence I

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2900. Longest Unequal Adjacent Groups Subsequence I
 * https://leetcode.com/problems/longest-unequal-adjacent-groups-subsequence-i/
 * Difficulty: Easy
 *
 * You are given a string array words and a binary array groups both of length n, where
words[i]
 * is associated with groups[i].
 *
 * Your task is to select the longest alternating subsequence from words. A subsequence of
words
 * is alternating if for any two consecutive strings in the sequence, their corresponding
elements
 * in the binary array groups differ. Essentially, you are to choose strings such that
adjacent
 * elements have non-matching corresponding bits in the groups array.
 *
 * Formally, you need to find the longest subsequence of an array of indices [0, 1, ..., n -
1]
 * denoted as [i0, i1, ..., ik-1], such that groups[ij] != groups[ij+1] for each 0 <= j < k -
1
 * and then find the words corresponding to these indices.
 *
 * Return the selected subsequence. If there are multiple answers, return any of them.
 *
 * Note: The elements in words are distinct.
 */

/**
 * @param {string[]} words
 * @param {number[]} groups
 * @return {string[]}
 */
var getLongestSubsequence = function(words, groups) {
  const result = [words[0]];
  let lastGroup = groups[0];

  for (let i = 1; i < words.length; i++) {
    if (groups[i] !== lastGroup) {
      result.push(words[i]);
      lastGroup = groups[i];
    }
  }

  return result;
};
```

2901 Longest Unequal Adjacent Groups Subsequence Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2901. Longest Unequal Adjacent Groups Subsequence II
 * https://leetcode.com/problems/longest-unequal-adjacent-groups-subsequence-ii/
 * Difficulty: Medium
 *
 * You are given a string array words, and an array groups, both arrays having length n.
 *
 * The hamming distance between two strings of equal length is the number of positions at
which the
 * corresponding characters are different.
```

```
 *
 * You need to select the longest subsequence from an array of indices [0, 1, ..., n - 1],
such
 * that for the subsequence denoted as [i0, i1, ..., ik-1] having length k, the following
holds:
 * - For adjacent indices in the subsequence, their corresponding groups are unequal, i.e.,
 *   groups[ij] != groups[ij+1], for each j where 0 < j + 1 < k.
 * - words[ij] and words[ij+1] are equal in length, and the hamming distance between them is
1,
 *   where 0 < j + 1 < k, for all indices in the subsequence.
 *
 * Return a string array containing the words corresponding to the indices (in order) in the
 * selected subsequence. If there are multiple answers, return any of them.
 *
 * Note: strings in words may be unequal in length.
 */

/**
 * @param {string[]} words
 * @param {number[]} groups
 * @return {string[]}
 */
var getWordsInLongestSubsequence = function(words, groups) {
  const n = words.length;
  const dp = new Array(n).fill(1);
  const prev = new Array(n).fill(-1);

2903 Find Indices With Index And Value Difference I

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2903. Find Indices With Index and Value Difference I
 * https://leetcode.com/problems/find-indices-with-index-and-value-difference-i/
```

```
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums having length n, an integer indexDifference,
 * and an integer valueDifference.
 *
 * Your task is to find two indices i and j, both in the range [0, n - 1], that satisfy the
 * following conditions:
 * - abs(i - j) >= indexDifference, and
 * - abs(nums[i] - nums[j]) >= valueDifference
 *
 * Return an integer array answer, where answer = [i, j] if there are two such indices, and
 * answer = [-1, -1] otherwise. If there are multiple choices for the two indices, return
 * any of them.
 *
 * Note: i and j may be equal.
 */

/**
 * @param {number[]} nums
 * @param {number} indexDifference
 * @param {number} valueDifference
 * @return {number[]}
 */
var findIndices = function(nums, indexDifference, valueDifference) {
  for (let i = 0; i < nums.length; i++) {
    for (let j = i; j < nums.length; j++) {
      if (Math.abs(i - j) >= indexDifference && Math.abs(nums[i] - nums[j]) >=
valueDifference) {
        return [i, j];
      }
    }
  }
  return [-1, -1];
};
```

2904 Shortest And Lexicographically Smallest Beautiful String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2904. Shortest and Lexicographically Smallest Beautiful String
 * https://leetcode.com/problems/shortest-and-lexicographically-smallest-beautiful-string/
 * Difficulty: Medium
 *
 * You are given a binary string s and a positive integer k.
 *
 * A substring of s is beautiful if the number of 1's in it is exactly k.
 *
 * Let len be the length of the shortest beautiful substring.
 *
 * Return the lexicographically smallest beautiful substring of string s with length equal to
 * len. If s doesn't contain a beautiful substring, return an empty string.
 *
 * A string a is lexicographically larger than a string b (of the same length) if in the first
 * position where a and b differ, a has a character strictly larger than the corresponding
 * character in b.
 * - For example, "abcd" is lexicographically larger than "abcc" because the first position
they
 *   differ is at the fourth character, and d is greater than c.
 */

      } else {
        break;
      }
    }
  }

  return result;
};
```

2933 High Access Employees

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 2933. High-Access Employees
 * https://leetcode.com/problems/high-access-employees/
 * Difficulty: Medium
 *
 * You are given a 2D 0-indexed array of strings, accessTimes, with size n. For each i where
 * 0 <= i <= n - 1, accessTimes[i][0] represents the name of an employee, and
accessTimes[i][1]
 * represents the access time of that employee. All entries in accessTimes are within the same
 day.
 *
 * The access time is represented as four digits using a 24-hour time format, for example,
"0800"
 * or "2250".
 *
 * An employee is said to be high-access if he has accessed the system three or more times
within
 * a one-hour period.
 *
 * Times with exactly one hour of difference are not considered part of the same one-hour
period.
 * For example, "0815" and "0915" are not part of the same one-hour period.
 *
 * Access times at the start and end of the day are not counted within the same one-hour
period.
 * For example, "0005" and "2350" are not part of the same one-hour period.
 *
 * Return a list that contains the names of high-access employees with any order you want.
 */

/**
 * @param {string[][]} accessTimes
 * @return {string[]}
 */
var findHighAccessEmployees = function(accessTimes) {
  const employeeAccess = new Map();

  for (const [name, time] of accessTimes) {
    const minutes = parseInt(time.slice(0, 2)) * 60 + parseInt(time.slice(2));
    if (!employeeAccess.has(name)) {
      employeeAccess.set(name, []);
    }
```

```
    employeeAccess.get(name).push(minutes);
  }

  const result = [];
  for (const [name, times] of employeeAccess) {
    times.sort((a, b) => a - b);
    if (times.length >= 3) {

        if (times[i + 2] - times[i] < 60) {
          result.push(name);
          break;
        }
      }
    }
  }

  return result;
};
```

2934 Minimum Operations To Maximize Last Elements In Arrays

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2934. Minimum Operations to Maximize Last Elements in Arrays
 * https://leetcode.com/problems/minimum-operations-to-maximize-last-elements-in-arrays/
 * Difficulty: Medium
 *
 * You are given two 0-indexed integer arrays, nums1 and nums2, both having length n.
 *
 * You are allowed to perform a series of operations (possibly none).
 *
 * In an operation, you select an index i in the range [0, n - 1] and swap the values of
 * nums1[i] and nums2[i].
 *
 * Your task is to find the minimum number of operations required to satisfy the following
 * conditions:
 * - nums1[n - 1] is equal to the maximum value among all elements of nums1, i.e.,
 *   nums1[n - 1] = max(nums1[0], nums1[1], ..., nums1[n - 1]).
 * - nums2[n - 1] is equal to the maximum value among all elements of nums2, i.e.,
 *   nums2[n - 1] = max(nums2[0], nums2[1], ..., nums2[n - 1]).
 *
 * Return an integer denoting the minimum number of operations needed to meet both conditions,
 * or -1 if it is impossible to satisfy both conditions.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number}
 */

  if (last1 !== last2) {
    swapsChange++;
  }

  return Math.min(swapsNoChange, swapsChange);
};
```

2936 Number Of Equal Numbers Blocks

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 2936. Number of Equal Numbers Blocks
 * https://leetcode.com/problems/number-of-equal-numbers-blocks/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array of integers, nums. The following property holds for nums:
 * - All occurrences of a value are adjacent. In other words, if there are two indices i < j
 *   such that nums[i] == nums[j], then for every index k that i < k < j, nums[k] == nums[i].
 *
 * Since nums is a very large array, you are given an instance of the class BigArray which has
 * the following functions:
 * - int at(long long index): Returns the value of nums[i].
 * - void size(): Returns nums.length.
 *
 * Let's partition the array into maximal blocks such that each block contains equal values.
 * Return the number of these blocks.
 *
 * Note that if you want to test your solution using a custom test, behavior for tests with
 * nums.length > 10 is undefined.
 */

/**
 * Definition for BigArray.
 * class BigArray {
 *     @param {number[]} elements
 *     constructor(elements);
 *
 *     @param {number} index
 *     @return {number}
 *     at(index);
 *
 *     @return {number}
 *     size();
 * }
 */

3019 Number Of Changing Keys

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 3019. Number of Changing Keys
 * https://leetcode.com/problems/number-of-changing-keys/
 * Difficulty: Easy
 *
 * You are given a 0-indexed string s typed by a user. Changing a key is defined as using a
key
 * different from the last used key. For example, s = "ab" has a change of a key while s =
"bBBb"
 * does not have any.
 *
 * Return the number of times the user had to change the key.
 *
 * Note: Modifiers like shift or caps lock won't be counted in changing the key that is if a
user
 * typed the letter 'a' and then the letter 'A' then it will not be considered as a changing
of key.
 */

/**
 * @param {string} s
 * @return {number}
 */
var countKeyChanges = function(s) {
  let result = 0;

  for (let i = 1; i < s.length; i++) {
    if (s[i].toLowerCase() !== s[i - 1].toLowerCase()) {
      result++;
    }
  }

  return result;
};
```

3021 Alice And Bob Playing Flower Game

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 3021. Alice and Bob Playing Flower Game
 * https://leetcode.com/problems/alice-and-bob-playing-flower-game/
 * Difficulty: Medium
 *
 * Alice and Bob are playing a turn-based game on a circular field surrounded by flowers.
 * The circle represents the field, and there are x flowers in the clockwise direction
 * between Alice and Bob, and y flowers in the anti-clockwise direction between them.
 *
 * The game proceeds as follows:
 * 1. Alice takes the first turn.
 * 2. In each turn, a player must choose either the clockwise or anti-clockwise direction
 *    and pick one flower from that side.
 * 3. At the end of the turn, if there are no flowers left at all, the current player
 *    captures their opponent and wins the game.
 *
 * Given two integers, n and m, the task is to compute the number of possible pairs (x, y)
 * that satisfy the conditions:
 * - Alice must win the game according to the described rules.
 * - The number of flowers x in the clockwise direction must be in the range [1,n].
 * - The number of flowers y in the anti-clockwise direction must be in the range [1,m].
 *
 * Return the number of possible pairs (x, y) that satisfy the conditions mentioned in the
 * statement.
 */

/**
 * @param {number} n
 * @param {number} m
 * @return {number}
 */
var flowerGame = function(n, m) {
```

```
  const evenN = Math.floor(n / 2);
  const evenM = Math.floor(m / 2);

  return evenN * (m - evenM) + (n - evenN) * evenM;
};
```

3023 Find Pattern In Infinite Stream I

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3023. Find Pattern in Infinite Stream I
 * https://leetcode.com/problems/find-pattern-in-infinite-stream-i/
 * Difficulty: Medium
 *
 * You are given a binary array pattern and an object stream of class InfiniteStream
 * representing a 0-indexed infinite stream of bits.
 *
 * The class InfiniteStream contains the following function:
 * - int next(): Reads a single bit (which is either 0 or 1) from the stream and returns it.
 *
 * Return the first starting index where the pattern matches the bits read from the stream.
 * For example, if the pattern is [1, 0], the first match is the highlighted part in the
 * stream [0, 1, 0, 1, ...].
 */

/**
 * Definition for an infinite stream.
 * class InfiniteStream {
 *     @param {number[]} bits
 *     constructor(bits);
 *
 *     @return {number}
 *     next();
 * }
 */
/**
 * @param {InfiniteStream} stream
 * @param {number[]} pattern
 * @return {number}
 */
var findPattern = function(stream, pattern) {
  const patternLength = pattern.length;
  const buffer = [];
  let currentIndex = 0;

  while (buffer.length < patternLength) {
    buffer.push(stream.next());
  }

  while (true) {
    if (isPatternMatch(buffer, pattern)) {
      return currentIndex;
    }

    buffer.shift();
    buffer.push(stream.next());
    currentIndex++;
  }

        return false;
      }
    }
    return true;
  }
};
```

3024 Type Of Triangle

EASY

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 3024. Type of Triangle
 * https://leetcode.com/problems/type-of-triangle/
 * Difficulty: Easy
 *
 * You are given a 0-indexed integer array nums of size 3 which can form the sides of a
triangle.
 * - A triangle is called equilateral if it has all sides of equal length.
 * - A triangle is called isosceles if it has exactly two sides of equal length.
 * - A triangle is called scalene if all its sides are of different lengths.
 *
 * Return a string representing the type of triangle that can be formed or "none" if it cannot
 * form a triangle.
 */

/**
 * @param {number[]} nums
 * @return {string}
 */
var triangleType = function(nums) {
  const [sideA, sideB, sideC] = nums.sort((a, b) => a - b);

  if (sideA + sideB <= sideC) return 'none';
  if (sideA === sideB && sideB === sideC) return 'equilateral';
  if (sideA === sideB || sideB === sideC) return 'isosceles';

  return 'scalene';
};
```

3025 Find The Number Of Ways To Place People I

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 3025. Find the Number of Ways to Place People I
 * https://leetcode.com/problems/find-the-number-of-ways-to-place-people-i/
 * Difficulty: Medium
 *
 * You are given a 2D array points of size n x 2 representing integer coordinates of some
points
 * on a 2D plane, where points[i] = [xi, yi].
 *
 * Count the number of pairs of points (A, B), where
 * - A is on the upper left side of B, and
 * - there are no other points in the rectangle (or line) they make (including the border).
 *
 * Return the count.
 */

/**
 * @param {number[][]} points
 * @return {number}
 */
var numberOfPairs = function(points) {
  points.sort((a, b) => a[0] === b[0] ? b[1] - a[1] : a[0] - b[0]);
  let result = 0;

  for (let i = 0; i < points.length; i++) {
    for (let j = i + 1; j < points.length; j++) {
      if (points[i][1] >= points[j][1]) {
        let isValid = true;
```

```
        for (let k = 0; k < points.length; k++) {
          if (k !== i && k !== j) {
            if (points[k][0] >= points[i][0] && points[k][0] <= points[j][0]
                && points[k][1] <= points[i][1] && points[k][1] >= points[j][1]) {
              isValid = false;
              break;
            }
          }
        }
        if (isValid) result++;
      }
    }
  }

  return result;
};
```

3027 Find The Number Of Ways To Place People Ii

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 3027. Find the Number of Ways to Place People II
 * https://leetcode.com/problems/find-the-number-of-ways-to-place-people-ii/
 * Difficulty: Hard
 *
 * You are given a 2D array points of size n x 2 representing integer coordinates of some
points
 * on a 2D-plane, where points[i] = [xi, yi].
 *
 * We define the right direction as positive x-axis (increasing x-coordinate) and the left
 * direction as negative x-axis (decreasing x-coordinate). Similarly, we define the up
direction
 * as positive y-axis (increasing y-coordinate) and the down direction as negative y-axis
 * (decreasing y-coordinate)
 *
 * You have to place n people, including Alice and Bob, at these points such that there is
exactly
 * one person at every point. Alice wants to be alone with Bob, so Alice will build a
rectangular
 * fence with Alice's position as the upper left corner and Bob's position as the lower right
 * corner of the fence (Note that the fence might not enclose any area, i.e. it can be a
line).
 * If any person other than Alice and Bob is either inside the fence or on the fence, Alice
will
 * be sad.
 *
 * Return the number of pairs of points where you can place Alice and Bob, such that Alice
does not
 * become sad on building the fence.
 *
 * Note that Alice can only build a fence with Alice's position as the upper left corner, and
Bob's
 * position as the lower right corner. For example, Alice cannot build either of the fences in
 the
 * picture below with four corners (1, 1), (1, 3), (3, 1), and (3, 3), because:
 * - With Alice at (3, 3) and Bob at (1, 1), Alice's position is not the upper left corner and
 Bob's
 *   position is not the lower right corner of the fence.
 * - With Alice at (1, 3) and Bob at (1, 1), Bob's position is not the lower right corner of
the
 *   fence.
 */

/**
 * @param {number[][]} points
 * @return {number}
 */
var numberOfPairs = function(points) {
  points.sort((a, b) => a[0] === b[0] ? b[1] - a[1] : a[0] - b[0]);
```

```
  let result = 0;

  for (let i = 0; i < points.length; i++) {
    const [, maxY] = points[i];
    let minY = -Infinity;

    for (let j = i + 1; j < points.length; j++) {
      const [, y] = points[j];
      if (y <= maxY && y > minY) {
        let isValid = true;
        for (let k = 0; k < points.length; k++) {
          if (k !== i && k !== j) {
            const [x, ky] = points[k];
            if (x >= points[i][0] && x <= points[j][0]
                && ky <= points[i][1] && ky >= points[j][1]) {
              isValid = false;
              break;
            }
          }
        }
        if (isValid) {
          result++;
          minY = y;
        }
      }
    }
  }

  return result;
};
```

3028 Ant On The Boundary

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3028. Ant on the Boundary
 * https://leetcode.com/problems/ant-on-the-boundary/
 * Difficulty: Easy
 *
 * An ant is on a boundary. It sometimes goes left and sometimes right.
 *
 * You are given an array of non-zero integers nums. The ant starts reading nums from the
 * first element of it to its end. At each step, it moves according to the value of the
 * current element:
 * - If nums[i] < 0, it moves left by -nums[i] units.
 * - If nums[i] > 0, it moves right by nums[i] units.
 *
 * Return the number of times the ant returns to the boundary.
 *
 * Notes:
 * - There is an infinite space on both sides of the boundary.
 * - We check whether the ant is on the boundary only after it has moved |nums[i]| units.
 *   In other words, if the ant crosses the boundary during its movement, it does not count.
 */

3030 Find The Grid Of Region Average

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3030. Find the Grid of Region Average
 * https://leetcode.com/problems/find-the-grid-of-region-average/
 * Difficulty: Medium
 *
 * You are given m x n grid image which represents a grayscale image, where image[i][j]
 * represents a pixel with intensity in the range [0..255]. You are also given a non-negative
 * integer threshold.
 *
 * Two pixels are adjacent if they share an edge.
 *
 * A region is a 3 x 3 subgrid where the absolute difference in intensity between any two
 * adjacent pixels is less than or equal to threshold.
 *
 * All pixels in a region belong to that region, note that a pixel can belong to multiple
regions.
 *
 * You need to calculate a m x n grid result, where result[i][j] is the average intensity of
the
```

```
 * regions to which image[i][j] belongs, rounded down to the nearest integer. If image[i][j]
 * belongs to multiple regions, result[i][j] is the average of the rounded-down average
intensities
 * of these regions, rounded down to the nearest integer. If image[i][j] does not belong to
any
 * region, result[i][j] is equal to image[i][j].
 *
 * Return the grid result.
 */

3037 Find Pattern In Infinite Stream Ii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 3037. Find Pattern in Infinite Stream II
 * https://leetcode.com/problems/find-pattern-in-infinite-stream-ii/
 * Difficulty: Hard
 *
 * You are given a binary array pattern and an object stream of class InfiniteStream
 * representing a 0-indexed infinite stream of bits.
 *
 * The class InfiniteStream contains the following function:
 * - int next(): Reads a single bit (which is either 0 or 1) from the stream and returns it.
 *
 * Return the first starting index where the pattern matches the bits read from the stream.
 * For example, if the pattern is [1, 0], the first match is the highlighted part in the
 * stream [0, 1, 0, 1, ...].
 */

/**
 * Definition for an infinite stream.
 * class InfiniteStream {
 *     @param {number[]} bits
 *     constructor(bits);
 *
 *     @return {number}
 *     next();
 * }
 */
/**
 * @param {InfiniteStream} stream
 * @param {number[]} pattern
 * @return {number}
 */
var findPattern = function(stream, pattern) {
  const patternLength = pattern.length;
  const failureFunction = buildFailureFunction(pattern);
  let streamIndex = 0;
  let patternIndex = 0;

  while (true) {
    const streamBit = stream.next();

    while (patternIndex > 0 && pattern[patternIndex] !== streamBit) {
      patternIndex = failureFunction[patternIndex - 1];
    }

    if (pattern[patternIndex] === streamBit) {
      patternIndex++;
    }

    if (patternIndex === patternLength) {
      return streamIndex - patternLength + 1;
    }

    streamIndex++;
  }

  function buildFailureFunction(pattern) {
    const failure = new Array(pattern.length).fill(0);
    let prefixLength = 0;

    for (let suffixEnd = 1; suffixEnd < pattern.length; suffixEnd++) {
      while (prefixLength > 0 && pattern[prefixLength] !== pattern[suffixEnd]) {
        prefixLength = failure[prefixLength - 1];
      }

      if (pattern[prefixLength] === pattern[suffixEnd]) {
        prefixLength++;
      }

      failure[suffixEnd] = prefixLength;
    }

    return failure;
  }
};
```

3038 Maximum Number Of Operations With The Same Score I

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3038. Maximum Number of Operations With the Same Score I
 * https://leetcode.com/problems/maximum-number-of-operations-with-the-same-score-i/
 * Difficulty: Easy
 *
 * You are given an array of integers nums. Consider the following operation:
 * - Delete the first two elements nums and define the score of the operation as the sum of
 *   these two elements.
 *
 * You can perform this operation until nums contains fewer than two elements. Additionally,
 * the same score must be achieved in all operations.
 *
 * Return the maximum number of operations you can perform.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var maxOperations = function(nums) {
  let result = 0;
  const targetScore = nums[0] + nums[1];

  for (let i = 0; i < nums.length - 1; i += 2) {
    if (nums[i] + nums[i + 1] === targetScore) {
      result++;
    } else {
      break;
    }
  }

  return result;
};
```

3039 Apply Operations To Make String Empty

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3039. Apply Operations to Make String Empty
 * https://leetcode.com/problems/apply-operations-to-make-string-empty/
 * Difficulty: Medium
 *
 * You are given a string s.
 *
 * Consider performing the following operation until s becomes empty:
 * - For every alphabet character from 'a' to 'z', remove the first occurrence of that
 *   character in s (if it exists).
 *
 * For example, let initially s = "aabcbbca". We do the following operations:
 * - Remove the underlined characters s = "aabcbbca". The resulting string is s = "abbca".
 * - Remove the underlined characters s = "abbca". The resulting string is s = "ba".
 * - Remove the underlined characters s = "ba". The resulting string is s = "".
 *
 * Return the value of the string s right before applying the last operation. In the
 * example above, answer is "ba".
 */

/**
 * @param {string} s
 * @return {string}
```

```
 */
var lastNonEmptyString = function(s) {
  const charCount = new Array(26).fill(0);
  let maxFrequency = 0;

  for (const char of s) {
    const index = char.charCodeAt(0) - 97;
    charCount[index]++;
    maxFrequency = Math.max(maxFrequency, charCount[index]);
  }

  let result = '';
  for (let i = s.length - 1; i >= 0; i--) {
    const index = s.charCodeAt(i) - 97;
    if (charCount[index] === maxFrequency) {
      result = s[i] + result;
      charCount[index]--;
    }
  }

  return result;
};
```

3042 Count Prefix And Suffix Pairs I

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3042. Count Prefix and Suffix Pairs I
 * https://leetcode.com/problems/count-prefix-and-suffix-pairs-i/
 * Difficulty: Easy
 *
 * You are given a 0-indexed string array words.
 *
 * Let's define a boolean function isPrefixAndSuffix that takes two strings, str1 and str2:
 * - isPrefixAndSuffix(str1, str2) returns true if str1 is both a prefix and a suffix of
 *   str2, and false otherwise.
 *
 * For example, isPrefixAndSuffix("aba", "ababa") is true because "aba" is a prefix of
 * "ababa" and also a suffix, but isPrefixAndSuffix("abc", "abcd") is false.
 *
 * Return an integer denoting the number of index pairs (i, j) such that i < j, and
 * isPrefixAndSuffix(words[i], words[j]) is true.
 */

/**
 * @param {string[]} words
 * @return {number}
 */
var countPrefixSuffixPairs = function(words) {
  let count = 0;

  for (let i = 0; i < words.length; i++) {
    for (let j = i + 1; j < words.length; j++) {
      if (words[j].startsWith(words[i]) && words[j].endsWith(words[i])) {
        count++;
      }
    }
  }

  return count;
};
```

3043 Find The Length Of The Longest Common Prefix

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3043. Find the Length of the Longest Common Prefix
 * https://leetcode.com/problems/find-the-length-of-the-longest-common-prefix/
 * Difficulty: Medium
 *
 * You are given two arrays with positive integers arr1 and arr2.
 *
 * A prefix of a positive integer is an integer formed by one or more of its digits, starting
 * from its leftmost digit. For example, 123 is a prefix of the integer 12345, while 234 is
not.
 *
 * A common prefix of two integers a and b is an integer c, such that c is a prefix of both a
 * and b. For example, 5655359 and 56554 have common prefixes 565 and 5655 while 1223 and
43456
 * do not have a common prefix.
 *
 * You need to find the length of the longest common prefix between all pairs of integers (x,
y)
 * such that x belongs to arr1 and y belongs to arr2.
 *
 * Return the length of the longest common prefix among all pairs. If no common prefix exists
 * among them, return 0.
 */

/**
 * @param {number[]} arr1
 * @param {number[]} arr2
 * @return {number}
 */
var longestCommonPrefix = function(arr1, arr2) {
  const prefixSet = new Set();
  let result = 0;

  for (const num of arr1) {
    let prefix = num;
    while (prefix > 0) {
      prefixSet.add(prefix);
      prefix = Math.floor(prefix / 10);
    }
  }

  for (const num of arr2) {
    let prefix = num;
    while (prefix > 0) {
      if (prefixSet.has(prefix)) {
        result = Math.max(result, String(prefix).length);
      }
      prefix = Math.floor(prefix / 10);
    }
  }

  return result;
};
```

3044 Most Frequent Prime

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3044. Most Frequent Prime
 * https://leetcode.com/problems/most-frequent-prime/
 * Difficulty: Medium
 *
 * You are given a m x n 0-indexed 2D matrix mat. From every cell, you can create numbers
 * in the following way:
```

```
 * - There could be at most 8 paths from the cells namely: east, south-east, south,
south-west,
 *   west, north-west, north, and north-east.
 * - Select a path from them and append digits in this path to the number being formed by
 *   traveling in this direction.
 * - Note that numbers are generated at every step, for example, if the digits along the path
 *   are 1, 9, 1, then there will be three numbers generated along the way: 1, 19, 191.
 *
 * Return the most frequent prime number greater than 10 out of all the numbers created by
 * traversing the matrix or -1 if no such prime number exists. If there are multiple prime
 * numbers with the highest frequency, then return the largest among them.
 *
 * Note: It is invalid to change the direction during the move.
 */

/**
 * @param {number[][]} mat
 * @return {number}
 */
var mostFrequentPrime = function(mat) {
  const m = mat.length;
  const n = mat[0].length;
  const frequency = new Map();
  const directions = [[0, 1], [1, 1], [1, 0], [1, -1], [0, -1], [-1, -1], [-1, 0], [-1, 1]];

  const isPrime = num => {

SOURCE CODE

```
/**
 * 3069. Distribute Elements Into Two Arrays I
 * https://leetcode.com/problems/distribute-elements-into-two-arrays-i/
 * Difficulty: Easy
 *
 * You are given a 1-indexed array of distinct integers nums of length n.
 *
 * You need to distribute all the elements of nums between two arrays arr1 and arr2 using n
 * operations. In the first operation, append nums[1] to arr1. In the second operation,
 * append nums[2] to arr2. Afterwards, in the ith operation:
 * - If the last element of arr1 is greater than the last element of arr2, append nums[i] to
arr1.
 *   Otherwise, append nums[i] to arr2.
 *
 * The array result is formed by concatenating the arrays arr1 and arr2. For example, if
 * arr1 == [1,2,3] and arr2 == [4,5,6], then result = [1,2,3,4,5,6].
 *
 * Return the array result.
 */

3078 Match Alphanumerical Pattern In Matrix I

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3078. Match Alphanumerical Pattern in Matrix I
 * https://leetcode.com/problems/match-alphanumerical-pattern-in-matrix-i/
 * Difficulty: Medium
 *
 * You are given a 2D integer matrix board and a 2D character matrix pattern.
 * Where 0 <= board[r][c] <= 9 and each element of pattern is either a digit or a
 * lowercase English letter.
 *
 * Your task is to find a submatrix of board that matches pattern.
 *
 * An integer matrix part matches pattern if we can replace cells containing letters in
 * pattern with some digits (each distinct letter with a unique digit) in such a way that
 * the resulting matrix becomes identical to the integer matrix part. In other words,
 * - The matrices have identical dimensions.
 * - If pattern[r][c] is a digit, then part[r][c] must be the same digit.
 * - If pattern[r][c] is a letter x:
 *   - For every pattern[i][j] == x, part[i][j] must be the same as part[r][c].
 *   - For every pattern[i][j] != x, part[i][j] must be different than part[r][c].
 *
 * Return an array of length 2 containing the row number and column number of the upper-left
 * corner of a submatrix of board which matches pattern. If there is more than one such
submatrix,
 * return the coordinates of the submatrix with the lowest row index, and in case there is
still
 * a tie, return the coordinates of the submatrix with the lowest column index. If there are
no
```

3094 Guess The Number Using Bitwise Questions Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3094. Guess the Number Using Bitwise Questions II
 * https://leetcode.com/problems/guess-the-number-using-bitwise-questions-ii/
 * Difficulty: Medium
 *
 * There is a number n between 0 and 230 - 1 (both inclusive) that you have to find.
 *
 * There is a pre-defined API int commonBits(int num) that helps you with your mission.
 * But here is the challenge, every time you call this function, n changes in some way.
 * But keep in mind, that you have to find the initial value of n.
 *
 * commonBits(int num) acts as follows:
 * - Calculate count which is the number of bits where both n and num have the same value
 *   in that position of their binary representation.
 * - n = n XOR num
 * - Return count.
 *
 * Return the number n.
 *
 * Note: In this world, all numbers are between 0 and 230 - 1 (both inclusive), thus for
counting
 * common bits, we see only the first 30 bits of those numbers.
 */

/**

```

3108 Minimum Cost Walk In Weighted Graph

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3108. Minimum Cost Walk in Weighted Graph
 * https://leetcode.com/problems/minimum-cost-walk-in-weighted-graph/
 * Difficulty: Hard
 *
 * There is an undirected weighted graph with n vertices labeled from 0 to n - 1.
 *
 * You are given the integer n and an array edges, where edges[i] = [ui, vi, wi] indicates
that
 * there is an edge between vertices ui and vi with a weight of wi.
 *
 * A walk on a graph is a sequence of vertices and edges. The walk starts and ends with a
vertex,
 * and each edge connects the vertex that comes before it and the vertex that comes after it.
 * It's important to note that a walk may visit the same edge or vertex more than once.
 *
 * The cost of a walk starting at node u and ending at node v is defined as the bitwise AND of
 the
 * weights of the edges traversed during the walk. In other words, if the sequence of edge
weights
 * encountered during the walk is w0, w1, w2, ..., wk, then the cost is calculated as w0 & w1
& w2
 * & ... & wk, where & denotes the bitwise AND operator.
 *
 * You are also given a 2D array query, where query[i] = [si, ti]. For each query, you need to
```

```
 find
 * the minimum cost of the walk starting at vertex si and ending at vertex ti. If there exists
 no
 * such walk, the answer is -1.
 *
 * Return the array answer, where answer[i] denotes the minimum cost of a walk for query i.
 */

/**
 * @param {number} n
 * @param {number[][]} edges
 * @param {number[][]} query
 * @return {number[]}
 */
var minimumCost = function(n, edges, query) {
  const parent = new Array(n).fill().map((_, i) => i);

3279 Maximum Total Area Occupied By Pistons

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 3279. Maximum Total Area Occupied by Pistons
 * https://leetcode.com/problems/maximum-total-area-occupied-by-pistons/
 * Difficulty: Hard
 *
 * There are several pistons in an old car engine, and we want to calculate the maximum
 * possible area under the pistons.
 *
 * You are given:
 * - An integer height, representing the maximum height a piston can reach.
 * - An integer array positions, where positions[i] is the current position of piston i,
 *   which is equal to the current area under it.
 * - A string directions, where directions[i] is the current moving direction of piston
 *   i, 'U' for up, and 'D' for down.
 *
 * Each second:
 * - Every piston moves in its current direction 1 unit. e.g., if the direction is up,
 *   positions[i] is incremented by 1.
 * - If a piston has reached one of the ends, i.e., positions[i] == 0 or
 *   positions[i] == height, its direction will change.
 *
 * Return the maximum possible area under all the pistons.
 */
```

```

3323 Minimize Connected Groups By Inserting Interval

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 3323. Minimize Connected Groups by Inserting Interval
 * https://leetcode.com/problems/minimize-connected-groups-by-inserting-interval/
 * Difficulty: Medium
 *
 * You are given a 2D array intervals, where intervals[i] = [starti, endi] represents the
 * start and the end of interval i. You are also given an integer k.
 *
 * You must add exactly one new interval [startnew, endnew] to the array such that:
 * - The length of the new interval, endnew - startnew, is at most k.
 * - After adding, the number of connected groups in intervals is minimized.
 *
 * A connected group of intervals is a maximal collection of intervals that, when considered
 * together, cover a continuous range from the smallest point to the largest point with no
gaps
 * between them. Here are some examples:
 * - A group of intervals [[1, 2], [2, 5], [3, 3]] is connected because together they cover
the
 *   range from 1 to 5 without any gaps.
 * - However, a group of intervals [[1, 2], [3, 4]] is not connected because the segment (2,
3)
 *   is not covered.
 *
 * Return the minimum number of connected groups after adding exactly one new interval to the
array.
 */

3335 Total Characters In String After Transformations I

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3335. Total Characters in String After Transformations I
 * https://leetcode.com/problems/total-characters-in-string-after-transformations-i/
 * Difficulty: Medium
 *
 * You are given a string s and an integer t, representing the number of transformations to
 * perform. In one transformation, every character in s is replaced according to the following
 * rules:
 * - If the character is 'z', replace it with the string "ab".
 * - Otherwise, replace it with the next character in the alphabet. For example, 'a' is
replaced
 *   with 'b', 'b' is replaced with 'c', and so on.
 *
 * Return the length of the resulting string after exactly t transformations.
 *
 * Since the answer may be very large, return it modulo 109 + 7.
 */
```

```
/**
 * @param {string} s
 * @param {number} t
 * @return {number}
 */
var lengthAfterTransformations = function(s, t) {
  const MOD = 1e9 + 7;
  const freq = new Array(26).fill(0);

3337 Total Characters In String After Transformations Ii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3337. Total Characters in String After Transformations II
 * https://leetcode.com/problems/total-characters-in-string-after-transformations-ii/
 * Difficulty: Hard
 *
 * You are given a string s consisting of lowercase English letters, an integer t representing
 * the number of transformations to perform, and an array nums of size 26. In one
transformation,
 * every character in s is replaced according to the following rules:
 * - Replace s[i] with the next nums[s[i] - 'a'] consecutive characters in the alphabet. For
 *   example, if s[i] = 'a' and nums[0] = 3, the character 'a' transforms into the next 3
 *   consecutive characters ahead of it, which results in "bcd".
 * - The transformation wraps around the alphabet if it exceeds 'z'. For example, if s[i] =
'y'
 *   and nums[24] = 3, the character 'y' transforms into the next 3 consecutive characters
ahead
 *   of it, which results in "zab".
 *
 * Return the length of the resulting string after exactly t transformations.
 *
 * Since the answer may be very large, return it modulo 109 + 7.

3354 Make Array Elements Equal To Zero

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3354. Make Array Elements Equal to Zero
 * https://leetcode.com/problems/make-array-elements-equal-to-zero/
 * Difficulty: Easy
 *
 * You are given an integer array nums.
 *
 * Start by selecting a starting position curr such that nums[curr] == 0, and choose a
movement
 * direction of either left or right.
 *
 * After that, you repeat the following process:
 * - If curr is out of the range [0, n - 1], this process ends.
 * - If nums[curr] == 0, move in the current direction by incrementing curr if you are moving
 *   right, or decrementing curr if you are moving left.
 * - Else if nums[curr] > 0:
 *   - Decrement nums[curr] by 1.
 *   - Reverse your movement direction (left becomes right and vice versa).
 *   - Take a step in your new direction.
 *
 * A selection of the initial position curr and movement direction is considered valid if
 * every element in nums becomes 0 by the end of the process.
 *
 * Return the number of possible valid selections.
 */

3363 Find The Maximum Number Of Fruits Collected

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3363. Find the Maximum Number of Fruits Collected
 * https://leetcode.com/problems/find-the-maximum-number-of-fruits-collected/
 * Difficulty: Hard
 *
 * There is a game dungeon comprised of n x n rooms arranged in a grid.
 *
 * You are given a 2D array fruits of size n x n, where fruits[i][j] represents the number of
fruits
 * in the room (i, j). Three children will play in the game dungeon, with initial positions at
 the
 * corner rooms (0, 0), (0, n - 1), and (n - 1, 0).
 *
 * The children will make exactly n - 1 moves according to the following rules to reach the
 * room (n - 1, n - 1):
 * - The child starting from (0, 0) must move from their current room (i, j) to one of the
rooms
 *   (i + 1, j + 1), (i + 1, j), and (i, j + 1) if the target room exists.
 * - The child starting from (0, n - 1) must move from their current room (i, j) to one of the
 rooms
 *   (i + 1, j - 1), (i + 1, j), and (i + 1, j + 1) if the target room exists.
 * - The child starting from (n - 1, 0) must move from their current room (i, j) to one of the
 rooms
 *   (i - 1, j + 1), (i, j + 1), and (i + 1, j + 1) if the target room exists.
 *
 * When a child enters a room, they will collect all the fruits there. If two or more children
 * enter the same room, only one child will collect the fruits, and the room will be emptied
after
 * they leave.
```

```

3369 Design An Array Statistics Tracker

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 3369. Design an Array Statistics Tracker
 * https://leetcode.com/problems/design-an-array-statistics-tracker/
 * Difficulty: Hard
```

```
 *
 * Design a data structure that keeps track of the values in it and answers some queries
regarding
 * their mean, median, and mode.
 *
 * Implement the StatisticsTracker class.
 * - StatisticsTracker(): Initialize the StatisticsTracker object with an empty array.
 * - void addNumber(int number): Add number to the data structure.
 * - void removeFirstAddedNumber(): Remove the earliest added number from the data structure.
 * - int getMean(): Return the floored mean of the numbers in the data structure.
 * - int getMedian(): Return the median of the numbers in the data structure.
 * - int getMode(): Return the mode of the numbers in the data structure. If there are
multiple
 *   modes, return the smallest one.
 *
 * Note:
 * - The mean of an array is the sum of all the values divided by the number of values in the
array.
 * - The median of an array is the middle element of the array when it is sorted in
non-decreasing
 *   order. If there are two choices for a median, the larger of the two values is taken.
 * - The mode of an array is the element that appears most often in the array.
 */

3375 Minimum Operations To Make Array Values Equal To K

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 3375. Minimum Operations to Make Array Values Equal to K
 * https://leetcode.com/problems/minimum-operations-to-make-array-values-equal-to-k/
 * Difficulty: Easy
 *
 * You are given an integer array nums and an integer k.
 *
 * An integer h is called valid if all values in the array that are strictly greater than
 * h are identical.
 *
 * For example, if nums = [10, 8, 10, 8], a valid integer is h = 9 because all nums[i] > 9
 * are equal to 10, but 5 is not a valid integer.
 *
 * You are allowed to perform the following operation on nums:
 * - Select an integer h that is valid for the current values in nums.
 * - For each index i where nums[i] > h, set nums[i] to h.
 *
 * Return the minimum number of operations required to make every element in nums equal to k.
 * If it is impossible to make all elements equal to k, return -1.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */

3383 Minimum Runes To Add To Cast Spell

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3383. Minimum Runes to Add to Cast Spell
 * https://leetcode.com/problems/minimum-runes-to-add-to-cast-spell/
 * Difficulty: Hard
 *
 * Alice has just graduated from wizard school, and wishes to cast a magic spell to celebrate.
 * The magic spell contains certain focus points where magic needs to be concentrated, and
some
 * of these focus points contain magic crystals which serve as the spell's energy source.
Focus
```

```
 * points can be linked through directed runes, which channel magic flow from one focus point
 * to another.
 *
 * You are given a integer n denoting the number of focus points and an array of integers
crystals
 * where crystals[i] indicates a focus point which holds a magic crystal. You are also given
two
 * integer arrays flowFrom and flowTo, which represent the existing directed runes. The ith
rune
 * allows magic to freely flow from focus point flowFrom[i] to focus point flowTo[i].
 *
 * You need to find the number of directed runes Alice must add to her spell, such that each
 * focus point either:
 * - Contains a magic crystal.
 * - Receives magic flow from another focus point.
 *
 * Return the minimum number of directed runes that she should add.

3408 Design Task Manager

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3408. Design Task Manager
 * https://leetcode.com/problems/design-task-manager/
 * Difficulty: Medium
 *
 * There is a task management system that allows users to manage their tasks, each associated
 * with a priority. The system should efficiently handle adding, modifying, executing, and
 * removing tasks.
 *
 * Implement the TaskManager class:
 * - TaskManager(vector<vector<int>>& tasks) initializes the task manager with a list of
 *   user-task-priority triples. Each element in the input list is of the form [userId,
 *   taskId, priority], which adds a task to the specified user with the given priority.
 * - void add(int userId, int taskId, int priority) adds a task with the specified taskId
 *   and priority to the user with userId. It is guaranteed that taskId does not exist in
 *   the system.
 * - void edit(int taskId, int newPriority) updates the priority of the existing taskId to
 *   newPriority. It is guaranteed that taskId exists in the system.
 * - void rmv(int taskId) removes the task identified by taskId from the system. It is
 *   guaranteed that taskId exists in the system.
```

```
 * - int execTop() executes the task with the highest priority across all users. If there
 *   are multiple tasks with the same highest priority, execute the one with the highest
 *   taskId. After executing, the taskId is removed from the system. Return the userId
 *   associated with the executed task. If no tasks are available, return -1.
 *
 * Note that a user may be assigned multiple tasks.
 */

```

3433 Count Mentions Per User

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 3433. Count Mentions Per User
 * https://leetcode.com/problems/count-mentions-per-user/
 * Difficulty: Medium
 *
 * You are given an integer numberOfUsers representing the total number of users and an
 * array events of size n x 3.
 *
 * Each events[i] can be either of the following two types:
 * 1. Message Event: ["MESSAGE", "timestampi", "mentions_stringi"]
 *    - This event indicates that a set of users was mentioned in a message at timestampi.
 *    - The mentions_stringi string can contain one of the following tokens:
 *      - id<number>: where <number> is an integer in range [0,numberOfUsers - 1]. There can
 *        be multiple ids separated by a single whitespace and may contain duplicates. This
 *        can mention even the offline users.
 *      - ALL: mentions all users.
 *      - HERE: mentions all online users.
 * 2. Offline Event: ["OFFLINE", "timestampi", "idi"]
 * - This event indicates that the user idi had become offline at timestampi for 60 time
units.
 *    The user will automatically be online again at time timestampi + 60.
```

```
 *
 * Return an array mentions where mentions[i] represents the number of mentions the user with
 * id i has across all MESSAGE events.
 *
 * All users are initially online, and if a user goes offline or comes back online, their
status
 * change is processed before handling any message event that occurs at the same timestamp.
 *
 * Note that a user can be mentioned multiple times in a single message event, and each
mention
 * should be counted separately.
 */

```

3484 Design Spreadsheet

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 3484. Design Spreadsheet
 * https://leetcode.com/problems/design-spreadsheet/
 * Difficulty: Medium
 *
 * A spreadsheet is a grid with 26 columns (labeled from 'A' to 'Z') and a given number
 * of rows. Each cell in the spreadsheet can hold an integer value between 0 and 105.
 *
 * Implement the Spreadsheet class:
 * - Spreadsheet(int rows) Initializes a spreadsheet with 26 columns (labeled 'A' to 'Z')
 *   and the specified number of rows. All cells are initially set to 0.
 * - void setCell(String cell, int value) Sets the value of the specified cell. The cell
 *   reference is provided in the format "AX" (e.g., "A1", "B10"), where the letter represents
 *   the column (from 'A' to 'Z') and the number represents a 1-indexed row.
 * - void resetCell(String cell) Resets the specified cell to 0.
 * - int getValue(String formula) Evaluates a formula of the form "=X+Y", where X and Y are
 *   either cell references or non-negative integers, and returns the computed sum.
 *
 * Note: If getValue references a cell that has not been explicitly set using setCell, its
 * value is considered 0.
 */
```

```
/**
 * @param {number} rows
 */
var Spreadsheet = function(rows) {
  this.cellValues = new Map();
  this.totalRows = rows;
};

/**
 * @param {string} cell
 * @param {number} value
 * @return {void}

    if (numbers[i + 1].startsWith(numbers[i])) {
      return false;
    }
  }

  return true;
};
```

3494 Find The Minimum Amount Of Time To Brew Potions

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3494. Find the Minimum Amount of Time to Brew Potions
 * https://leetcode.com/problems/find-the-minimum-amount-of-time-to-brew-potions/
 * Difficulty: Medium
 *
 * You are given two integer arrays, skill and mana, of length n and m, respectively.
 *
 * In a laboratory, n wizards must brew m potions in order. Each potion has a mana capacity
 * mana[j] and must pass through all the wizards sequentially to be brewed properly. The
 * time taken by the ith wizard on the jth potion is timeij = skill[i] * mana[j].
 *
 * Since the brewing process is delicate, a potion must be passed to the next wizard
 * immediately after the current wizard completes their work. This means the timing must
 * be synchronized so that each wizard begins working on a potion exactly when it arrives.
 *
 * Return the minimum amount of time required for the potions to be brewed properly.
 */
```

```
/**
 * @param {number[]} skill
 * @param {number[]} mana
 * @return {number}
 */
var minTime = function(skill, mana) {
  const result = new Array(skill.length + 1).fill(0);

  for (let j = 0; j < mana.length; j++) {
    for (let i = 0; i < skill.length; i++) {
      result[i + 1] = Math.max(result[i + 1], result[i]) + mana[j] * skill[i];
    }
    for (let i = skill.length - 1; i > 0; i--) {
      result[i] = result[i + 1] - mana[j] * skill[i];
    }
  }

  return result[skill.length];
};
```

3495 Minimum Operations To Make Array Elements Zero

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3495. Minimum Operations to Make Array Elements Zero
 * https://leetcode.com/problems/minimum-operations-to-make-array-elements-zero/
 * Difficulty: Hard
 *
 * You are given a 2D array queries, where queries[i] is of the form [l, r]. Each
 * queries[i] defines an array of integers nums consisting of elements ranging
 * from l to r, both inclusive.
 *
 * In one operation, you can:
 * - Select two integers a and b from the array.
 * - Replace them with floor(a / 4) and floor(b / 4).
 *
 * Your task is to determine the minimum number of operations required to reduce all
 * elements of the array to zero for each query. Return the sum of the results for
 * all queries.
 */

/**
 * @param {number[][]} queries
 * @return {number}
 */
var minOperations = function(queries) {
  let result = 0;

  for (const [start, end] of queries) {
    let operationsNeeded = 0;

    }
    return totalSum - minPairSum;
  }
};
```

3506 Find Time Required To Eliminate Bacterial Strains

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3506. Find Time Required to Eliminate Bacterial Strains
 * https://leetcode.com/problems/find-time-required-to-eliminate-bacterial-strains/
 * Difficulty: Hard
 *
 * You are given an integer array timeReq and an integer splitTime.
 *
 * In the microscopic world of the human body, the immune system faces an extraordinary
 * challenge: combatting a rapidly multiplying bacterial colony that threatens the body's
survival.
 *
 * Initially, only one white blood cell (WBC) is deployed to eliminate the bacteria. However,
the
 * lone WBC quickly realizes it cannot keep up with the bacterial growth rate.
 *
 * The WBC devises a clever strategy to fight the bacteria:
 * - The ith bacterial strain takes timeReq[i] units of time to be eliminated.
 * - A single WBC can eliminate only one bacterial strain. Afterwards, the WBC is exhausted
and
 *   cannot perform any other tasks.
 * - A WBC can split itself into two WBCs, but this requires splitTime units of time. Once
split,
```

```
 *   the two WBCs can work in parallel on eliminating the bacteria.
 * - Only one WBC can work on a single bacterial strain. Multiple WBCs cannot attack one
strain
 *   in parallel.
 *
 * You must determine the minimum time required to eliminate all the bacterial strains.
 *
 * Note that the bacterial strains can be eliminated in any order.
 */

/**
 * @param {number[]} timeReq
 * @param {number} splitTime
 * @return {number}
 */
var minEliminationTime = function(timeReq, splitTime) {
  const heap = new PriorityQueue((a, b) => a - b);

  for (const time of timeReq) {
    heap.enqueue(time);
  }

  heap.dequeue();

  let result = 0;
  while (!heap.isEmpty()) {
    const bacteria = splitTime + heap.dequeue();
    if (!heap.isEmpty()) {
      heap.enqueue(bacteria);
      result = heap.dequeue();
    } else {
      result = bacteria;
    }
  }

  return result;
};
```

3508 Implement Router

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 3508. Implement Router
 * https://leetcode.com/problems/implement-router/
 * Difficulty: Medium
 *
 * Design a data structure that can efficiently manage data packets in a network router.
 * Each data packet consists of the following attributes:
 * - source: A unique identifier for the machine that generated the packet.
 * - destination: A unique identifier for the target machine.
 * - timestamp: The time at which the packet arrived at the router.
 *
 * Implement the Router class:
 * Router(int memoryLimit): Initializes the Router object with a fixed memory limit.
 * - memoryLimit is the maximum number of packets the router can store at any given time.
 * - If adding a new packet would exceed this limit, the oldest packet must be removed to
 *   free up space.
 * bool addPacket(int source, int destination, int timestamp): Adds a packet with the
 * given attributes to the router.
 * - A packet is considered a duplicate if another packet with the same source, destination,
 *   and timestamp already exists in the router.
 * - Return true if the packet is successfully added (i.e., it is not a duplicate); otherwise
 *   return false.
 * int[] forwardPacket(): Forwards the next packet in FIFO (First In First Out) order.
 * - Remove the packet from storage.
 * - Return the packet as an array [source, destination, timestamp].
 * - If there are no packets to forward, return an empty array.
 * int getCount(int destination, int startTime, int endTime):
 * - Returns the number of packets currently stored in the router (i.e., not yet forwarded)
```

```
that
 *   have the specified destination and have timestamps in the inclusive range [startTime,
endTime].
 *
 * Note that queries for addPacket will be made in increasing order of timestamp.

3541 Find Most Frequent Vowel And Consonant

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3541. Find Most Frequent Vowel and Consonant
 * https://leetcode.com/problems/find-most-frequent-vowel-and-consonant/
 * Difficulty: Easy
 *
 * You are given a string s consisting of lowercase English letters ('a' to 'z').
 *
 * Your task is to:
 * - Find the vowel (one of 'a', 'e', 'i', 'o', or 'u') with the maximum frequency.
 * - Find the consonant (all other letters excluding vowels) with the maximum frequency.
 *
 * Return the sum of the two frequencies.
 *
 * Note: If multiple vowels or consonants have the same maximum frequency, you may choose
 * any one of them. If there are no vowels or no consonants in the string, consider their
 * frequency as 0.
 *
 * The frequency of a letter x is the number of times it occurs in the string.
 */

  const maxConsonantFreq = Math.max(0, ...Object.values(consonantFreq));

  return maxVowelFreq + maxConsonantFreq;
};
```

3577 Count The Number Of Computer Unlocking Permutations

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 3577. Count the Number of Computer Unlocking Permutations
 * https://leetcode.com/problems/count-the-number-of-computer-unlocking-permutations/
 * Difficulty: Medium
 *
 * You are given an array complexity of length n.
 *
 * There are n locked computers in a room with labels from 0 to n - 1, each with its own
 * unique password. The password of the computer i has a complexity complexity[i].
 *
 * The password for the computer labeled 0 is already decrypted and serves as the root.
 * All other computers must be unlocked using it or another previously unlocked computer,
 * following this information:
 * - You can decrypt the password for the computer i using the password for computer j,
 *   where j is any integer less than i with a lower complexity. (i.e. j < i and
 *   complexity[j] < complexity[i])
 * - To decrypt the password for computer i, you must have already unlocked a computer j
 *   such that j < i and complexity[j] < complexity[i].
 *
 * Find the number of permutations of [0, 1, 2, ..., (n - 1)] that represent a valid order
 * in which the computers can be unlocked, starting from computer 0 as the only initially
 * unlocked one.
 *
 * Since the answer may be large, return it modulo 109 + 7.
 *
 * Note that the password for the computer with label 0 is decrypted, and not the computer
 * with the first position in the permutation.
 */
