NUMBERED SOLUTION COMPANION

Match each exercise by its four-digit problem number. Includes the original JavaScript source, approach hints and study prompts. Use PDF bookmarks to jump directly to a problem.

READING CODE: A QUICK MAP

Loop

Trace changing values after each iteration.

Map / Set

Track keys, values, membership checks and duplicates.

Recursion

Identify the base case and what each call returns.

Dynamic programming

Record the state definition and recurrence.

Complexity

Count repeated operations and extra data structures.

0001 Two Sum

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1. Two Sum
 * https://leetcode.com/problems/two-sum/
 * Difficulty: Easy
 *
 * Given an array of integers `nums` and an integer `target`, return indices
 * of the two numbers such that they add up to `target`.
 *
 * You may assume that each input would have exactly one solution, and you
 * may not use the same element twice.
 *
 * You can return the answer in any order.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number[]}
 */
var twoSum = function(nums, target) {
  const map = new Map();

  for (let i = 0; i < nums.length; i++) {
    const diff = target - nums[i];

    if (map.has(diff)) {
      return [map.get(diff), i];
    }

    map.set(nums[i], i);
  }
};
```

0002 Add Two Numbers

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 2. Add Two Numbers
 * https://leetcode.com/problems/add-two-numbers/
 * Difficulty: Medium
 *
 * You are given two non-empty linked lists representing two non-negative integers.
 *
 * The digits are stored in reverse order, and each of their nodes contains a single digit.
 * Add the two numbers and return the sum as a linked list.
 *
 * You may assume the two numbers do not contain any leading zero, except the number 0 itself.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} l1
 * @param {ListNode} l2
 * @return {ListNode}
```

```
 */
var addTwoNumbers = function(l1, l2) {
  const result = new ListNode();

  for (let tail = result, carry = 0; l1 || l2 || carry;) {
    const value = (l1?.val ?? 0) + (l2?.val ?? 0) + carry;
    tail.next = new ListNode(value % 10);
    tail = tail.next;
    carry = value >= 10 ? 1 : 0;
    [l1, l2] = [l1 && l1.next, l2 && l2.next];
  }

  return result.next;
};
```

0003 Longest Substring Without Repeating Characters

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 3. Longest Substring Without Repeating Characters
 * https://leetcode.com/problems/longest-substring-without-repeating-characters/
 * Difficulty: Medium
 *
 * Given a string `s`, find the length of the longest substring without repeating characters.
 */

/**
 * @param {string} s
 * @return {number}
 */
var lengthOfLongestSubstring = function(s) {
  const map = {};
  let offset = 0;

  return s.split('').reduce((max, value, i) => {
    offset = map[value] >= offset ? map[value] + 1 : offset;
    map[value] = i;
    return Math.max(max, i - offset + 1);
  }, 0);
};
```

0004 Median Of Two Sorted Arrays

HARD

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 4. Median of Two Sorted Arrays
 * https://leetcode.com/problems/median-of-two-sorted-arrays/
 * Difficulty: Hard
 *
 * There are two sorted arrays nums1 and nums2 of size m and n respectively.
 *
 * Find the median of the two sorted arrays.
 * The overall run time complexity should be O(log (m+n)).
 *
 * You may assume nums1 and nums2 cannot be both empty.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number}
 */
var findMedianSortedArrays = function(nums1, nums2) {
```

```
  const sorted = [...nums1, ...nums2].sort((a, b) => a - b);
  const index = Math.floor((sorted.length - 1) / 2);

  return sorted.length % 2 === 0
    ? (sorted[index] + sorted[index + 1]) / 2
    : sorted[index];
};
```

0005 Longest Palindromic Substring

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 5. Longest Palindromic Substring
 * https://leetcode.com/problems/longest-palindromic-substring/
 * Difficulty: Medium
 *
 * Given a string `s`, return the longest palindromic substring in `s`.
 */

/**
 * @param {string} s
 * @return {string}
 */
var longestPalindrome = function(s) {
  let result = '';

  for (let i = 0; i < s.length; i++) {
    const palindrome1 = getExtendedPalindrome(s, i, i);
    const palindrome2 = getExtendedPalindrome(s, i, i + 1);
    const longerPalindrome = palindrome1.length > palindrome2.length
      ? palindrome1
      : palindrome2;

    if (longerPalindrome.length > result.length) {
      result = longerPalindrome;
    }
  }

  return result;
};

function getExtendedPalindrome(s, start, end) {
  while (start >= 0 && end < s.length && s[start] === s[end]) {
    start--;
    end++;
  }

  return s.slice(start + 1, end);
}
```

0006 Zigzag Conversion

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 6. ZigZag Conversion
 * https://leetcode.com/problems/zigzag-conversion/
 * Difficulty: Medium
 *
 * The string `"PAYPALISHIRING"` is written in a zigzag pattern on a given
 * number of rows like this: (you may want to display this pattern in a
 * fixed font for better legibility)
 *
 * > P   A   H   N
```

```
 * > A P L S I I G
 * > Y   I   R
 *
 * And then read line by line: `"PAHNAPLSIIGYIR"`
 */

/**
 * @param {string} s
 * @param {number} numRows
 * @return {string}
 */
var convert = function(s, numRows) {
  const order = [...new Array(numRows).keys()];
  order.push(...order.slice(1, -1).reverse());

  const rows = new Array(numRows).fill('');
  [...s].forEach((c, i) => (rows[order[i % order.length]] += c));

  return rows.join('');
};
```

0007 Reverse Integer

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 7. Reverse Integer
 * https://leetcode.com/problems/reverse-integer/
 * Difficulty: Easy
 *
 * Given a signed 32-bit integer x, return x with its digits reversed.
 * If reversing x causes the value to go outside the signed 32-bit integer
 * range [-2^31, 2^31 - 1], then return 0.
 */

/**
 * @param {number} x
 * @return {number}
 */
var reverse = function(x) {
  const reversed = String(Math.abs(x)).split('').reverse().join('');

  if (reversed > Math.pow(2, 31)) {
    return 0;
  }

  return reversed * Math.sign(x);
};
```

0008 String To Integer Atoi

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 8. String to Integer (atoi)
 * https://leetcode.com/problems/string-to-integer-atoi/
 * Difficulty: Medium
 *
 * Implement the myAtoi(string s) function, which converts a string to a
 * 32-bit signed integer (similar to C/C++'s atoi function).
 *
 * The algorithm for myAtoi(string s) is as follows:
 *
 * - Read in and ignore any leading whitespace.
 * - Check if the next character (if not already at the end of the string)
```

```
 *   is '-' or '+'. Read this character in if it is either. This determines
 *   if the final result is negative or positive respectively.
 *   Assume the result is positive if neither is present.
 * - Read in next the characters until the next non-digit charcter or the end
 *   of the input is reached. The rest of the string is ignored.
 * - Convert these digits into an integer (i.e. "123" -> 123, "0032" -> 32).
 *   If no digits were read, then the integer is 0. Change the sign as
 *   necessary (from step 2).
 * - If the integer is out of the 32-bit signed integer range [-231, 231 - 1],
 *   then clamp the integer so that it remains in the range. Specifically,
 *   integers less than -231 should be clamped to -231, and integers greater
 *   than 231 - 1 should be clamped to 231 - 1.
 * - Return the integer as the final result.
 */

/**
 * @param {string} s
 * @return {number}
 */
var myAtoi = function(s) {
  const parsed = +(s.trim().match(/^[-+]?\d+/g) || [0])[0];
  const clamped = Math.min(Math.max(parsed, (-2)**31), 2**31 - 1);

  return clamped;
};
```

0009 Palindrome Number

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 9. Palindrome Number
 * https://leetcode.com/problems/palindrome-number/
 * Difficulty: Easy
 *
 * Given an integer `x`, return `true` if `x` is palindrome integer.
 *
 * An integer is a palindrome when it reads the same backward as forward.
 * - For example, `121` is palindrome while `123` is not.
 */

/**
 * @param {number} x
 * @return {boolean}
 */
var isPalindrome = function(x) {
  if (x < 0) return false;
  return +String(x).split('').reverse().join('') === x;
};
```

0010 Regular Expression Matching

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 10. Regular Expression Matching
 * https://leetcode.com/problems/regular-expression-matching/
 * Difficulty: Hard
 *
 * Given an input string s and a pattern p, implement regular expression
 * matching with support for '.' and '*' where:
 *
 * '.' Matches any single character.
 * '*' Matches zero or more of the preceding element.
 *
```

```
 * The matching should cover the entire input string (not partial).
 */

/**
 * @param {string} s
 * @param {string} p
 * @return {boolean}
 */
var isMatch = function(s, p) {
  return new RegExp(`^${p}$`).test(s);
};
```

0011 Container With Most Water

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 11. Container With Most Water
 * https://leetcode.com/problems/container-with-most-water/
 * Difficulty: Medium
 *
 * Given n non-negative integers `a1, a2, ..., an ,` where each represents a point at
 * coordinate `(i, ai)`. `n` vertical lines are drawn such that the two endpoints of
 * the line `i` is at `(i, ai)` and `(i, 0)`. Find two lines, which, together with the
 * x-axis forms a container, such that the container contains the most water.
 *
 * Notice that you may not slant the container.
 */

/**
 * @param {number[]} height
 * @return {number}
 */
var maxArea = function(height) {
  let maxArea = 0;

  for (let left = 0, right = height.length - 1; left < right;) {
    maxArea = Math.max(
      maxArea,
      Math.min(height[left], height[right]) * (right - left)
    );

    if (height[left] < height[right]) {
      left++;
    } else {
      right--;
    }
  }

  return maxArea;
};
```

0012 Integer To Roman

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 12. Integer to Roman
 * https://leetcode.com/problems/integer-to-roman/
 * Difficulty: Medium
 *
 * Roman numerals are represented by seven different symbols: `I`, `V`, `X`,
 * `L`, `C`, `D` and `M`.
 *
 * Symbol       Value
```

```
 * I            1
 * V            5
 * X            10
 * L            50
 * C            100
 * D            500
 * M            1000
 *
 * For example, `2` is written as `II` in Roman numeral, just two one's
 * added together. `12` is written as `XII`, which is simply `X + II`.
 * The number `27` is written as `XXVII`, which is `XX + V + II`.
 *
 * Roman numerals are usually written largest to smallest from left to right.
 * However, the numeral for four is not `IIII`. Instead, the number four is
 * written as `IV`. Because the one is before the five we subtract it making
 * four. The same principle applies to the number nine, which is written as
 * `IX`. There are six instances where subtraction is used:
 *
 * - `I` can be placed before `V (5)` and `X (10)` to make 4 and 9.
 * - `X` can be placed before `L (50)` and `C (100)` to make 40 and 90.
 * - `C` can be placed before `D (500)` and `M (1000)` to make 400 and 900.
 *
 * Given an integer, convert it to a roman numeral.
 */

/**
 * @param {number} num
 * @return {string}
 */
var intToRoman = function(num) {
  const map = {
    M: 1000, CM: 900, D: 500, CD: 400, C: 100, XC: 90,
    L: 50, XL: 40, X: 10, IX: 9, V: 5, IV: 4, I: 1
  };

  return Object.entries(map).reduce((result, [letter, n]) => {
    result += letter.repeat(Math.floor(num / n));
    num %= n;
    return result;
  }, '');
};
```

0013 Roman To Integer

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 13. Roman to Integer
 * https://leetcode.com/problems/roman-to-integer/
 * Difficulty: Easy
 *
 * Roman numerals are represented by seven different symbols: `I`, `V`, `X`,
 * `L`, `C`, `D` and `M`.
 *
 * Symbol       Value
 * I            1
 * V            5
 * X            10
 * L            50
 * C            100
 * D            500
 * M            1000
 *
 * For example, `2` is written as `II` in Roman numeral, just two one's
 * added together. `12` is written as `XII`, which is simply `X + II`.
 * The number `27` is written as `XXVII`, which is `XX + V + II`.
 *
 * Roman numerals are usually written largest to smallest from left to right.
 * However, the numeral for four is not `IIII`. Instead, the number four is
 * written as `IV`. Because the one is before the five we subtract it making
```

```
 * four. The same principle applies to the number nine, which is written as
 * `IX`. There are six instances where subtraction is used:
 *
 * - `I` can be placed before `V (5)` and `X (10)` to make 4 and 9.
 * - `X` can be placed before `L (50)` and `C (100)` to make 40 and 90.
 * - `C` can be placed before `D (500)` and `M (1000)` to make 400 and 900.
 *
 * Given a roman numeral, convert it to an integer.
 */

/**
 * @param {string} s
 * @return {number}
 */
var romanToInt = function(s) {
  const map = { M: 1000, D: 500, C: 100, L: 50, X: 10, V: 5, I: 1 };

  return s.split('').reduce((result, v, i) => {
    result += map[v] >= map[s[i + 1]] || s.length === i + 1
      ? map[v]
      : -1 * map[v];
    return result;
  }, 0);
};
```

0014 Longest Common Prefix

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 14. Longest Common Prefix
 * https://leetcode.com/problems/longest-common-prefix/
 * Difficulty: Easy
 *
 * Write a function to find the longest common prefix string amongst an array of strings.
 *
 * If there is no common prefix, return an empty string `""`.
 */

/**
 * @param {string[]} strs
 * @return {string}
 */
var longestCommonPrefix = function(strs) {
  const prefixes = strs[0].split('').map((_, i) => strs[0].slice(0, i + 1));

  for (let i = strs.length - 1; i > -1; i--) {
    for (let j = prefixes.length - 1; j > -1; j--) {
      if (strs[i].substr(0, j + 1) !== prefixes[j]) {
        prefixes.pop();
      }
    }
  }

  return prefixes.pop() || '';
};
```

0015 3Sum

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 15. 3Sum
 * https://leetcode.com/problems/3sum/
```

```
 * Difficulty: Medium
 *
 * Given an integer array nums, return all the triplets [nums[i], nums[j], nums[k]]
 * such that i != j, i != k, and j != k, and nums[i] + nums[j] + nums[k] == 0.
 *
 * Notice that the solution set must not contain duplicate triplets.
 */

/**
 * @param {number[]} nums
 * @return {number[][]}
 */
var threeSum = function(nums) {
  const result = [];
  nums.sort((a, b) => a - b);

  for (let i = 0; i < nums.length - 2; i++) {
    if (i > 0 && nums[i] === nums[i - 1]) continue;
    let j = i + 1;
    let k = nums.length - 1;
    while (j < k) {
      const sum = nums[i] + nums[j] + nums[k];
      if (!sum) {
        result.push([nums[i], nums[j], nums[k]]);
        j++;
        k--;
        while (j < k && nums[j] === nums[j - 1]) {
          j++;
        }
        while (j < k && nums[k] === nums[k + 1]) {
          k--;
        }
      } else {
        sum < 0 ? j++ : k--;
      }
    }
  }

  return result;
};
```

0016 3Sum Closest

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 16. 3Sum Closest
 * https://leetcode.com/problems/3sum-closest/
 * Difficulty: Medium
 *
 * Given an integer array nums of length n and an integer target, find three integers
 * in nums such that the sum is closest to target.
 *
 * Return the sum of the three integers.
 *
 * You may assume that each input would have exactly one solution.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number}
 */
var threeSumClosest = function(nums, target) {
  const sums = new Set();

  nums.sort((a, b) => a - b);

  for (let i = 0; i < nums.length - 2; i++) {
```

```
    let j = i + 1;
    let k = nums.length - 1;

    while (j < k) {
      const sum = nums[i] + nums[j] + nums[k];
      sums.add(sum);
      if (sum > target) {
        k--;
      } else {
        j++;
      }
    }
  }

  return [...sums].reduce((p, c) => Math.abs(c - target) < Math.abs(p - target) ? c : p);
};
```

0017 Letter Combinations Of A Phone Number

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 17. Letter Combinations of a Phone Number
 * https://leetcode.com/problems/letter-combinations-of-a-phone-number/
 * Difficulty: Medium
 *
 * Given a string containing digits from 2-9 inclusive, return all possible
 * letter combinations that the number could represent. Return the answer
 * in any order.
 *
 * A mapping of digit to letters (just like on the telephone buttons) is
 * given below. Note that 1 does not map to any letters.
 */

/**
 * @param {string} digits
 * @return {string[]}
 */
var letterCombinations = function(digits) {
  if (!digits || !digits.length) return [];

  const map = {
    2: 'abc',
    3: 'def',
    4: 'ghi',
    5: 'jkl',
    6: 'mno',
    7: 'pqrs',
    8: 'tuv',
    9: 'wxyz'
  };

  if (digits.length === 1) {
    return map[digits].split('');
  }

  const result = [];
  const group1 = letterCombinations(digits.substr(0, 1));
  const group2 = letterCombinations(digits.substr(1));

  for (let i = 0; i < group1.length; i++) {
    for (let j = 0; j < group2.length; j++) {
      result.push(group1[i] + group2[j]);
    }
  }

  return result;
};
```

0018 4Sum

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 18. 4Sum
 * https://leetcode.com/problems/4sum/
 * Difficulty: Medium
 *
 * Given an array nums of n integers, return an array of all the unique
 * quadruplets [nums[a], nums[b], nums[c], nums[d]] such that:
 * - 0 <= a, b, c, d < n
 * - a, b, c, and d are distinct.
 * - nums[a] + nums[b] + nums[c] + nums[d] == target
 *
 * You may return the answer in any order.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number[][]}
 */
var fourSum = function(nums, target) {
  const result = [];

  nums.sort((a, b) => a - b);

  for (let i = 0; i < nums.length - 3; i++) {
    for (let j = i + 1; j < nums.length - 2; j++) {
      let high = nums.length - 1;
      let low = j + 1;

      while (low < high) {

  let fast = result;
  slow.next = head;

  for (let i = 0; i <= n; i++) {
    fast = fast.next;
  }

  while (fast) {
    fast = fast.next;
    slow = slow.next;
  }

  slow.next = slow.next.next;

  return result.next;
};
```

0020 Valid Parentheses

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 20. Valid Parentheses
 * https://leetcode.com/problems/valid-parentheses/
 * Difficulty: Easy
 *
 * Given a string s containing just the characters '(', ')', '{', '}',
 * '[' and ']', determine if the input string is valid.
 *
 * An input string is valid if:
 * - Open brackets must be closed by the same type of brackets.
 * - Open brackets must be closed in the correct order.
 */

/**
 * @param {string} s
 * @return {boolean}
```

```
 */
var isValid = function(s) {
  const map = {
    '(': ')',
    '[': ']',
    '{': '}',
  };
  const stack = [];

  for (let i = 0; i < s.length; i++) {
    if (map[s[i]]) {
      stack.push(map[s[i]]);
    } else {
      if (stack.pop() !== s[i]) {
        return false;
      }
    }
  }

  return stack.length === 0;
};
```

0021 Merge Two Sorted Lists

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 21. Merge Two Sorted Lists
 * https://leetcode.com/problems/merge-two-sorted-lists/
 * Difficulty: Easy
 *
 * Merge two sorted linked lists and return it as a sorted list.
 * The list should be made by splicing together the nodes of the
 * first two lists.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} l1
 * @param {ListNode} l2
 * @return {ListNode}
 */
var mergeTwoLists = function(l1, l2) {
  if (!l1 || !l2) {
    return l1 || l2;
  }

  if (l1.val > l2.val) {
    [l2, l1] = [l1, l2];
  }

  l1.next = mergeTwoLists(l1.next, l2);

  return l1;
};
```

0022 Generate Parentheses

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 22. Generate Parentheses
 * https://leetcode.com/problems/generate-parentheses/
 * Difficulty: Medium
 *
 * Given n pairs of parentheses, write a function to generate all combinations of
 * well-formed parentheses.
 */

/**
 * @param {number} n
 * @return {string[]}
 */
var generateParenthesis = function(n) {
  const result = [];
  backtrack(result, '', 0, 0, n);
  return result;
};

function backtrack(result, str, open, close, max) {
  if (str.length === max * 2) {
    result.push(str);
    return;
  }

  if (open < max) backtrack(result, `${str}(`, open + 1, close, max);
  if (close < open) backtrack(result, `${str})`, open, close + 1, max);
}
```

0023 Merge K Sorted Lists

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 23. Merge k Sorted Lists
 * https://leetcode.com/problems/merge-k-sorted-lists/
 * Difficulty: Hard
 *
 * You are given an array of k linked-lists lists, each linked-list is sorted
 * in ascending order.
 *
 * Merge all the linked-lists into one sorted linked-list and return it.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode[]} lists
 * @return {ListNode}
 */
var mergeKLists = function(lists) {
  const map = new Map();
  for (let list of lists) {
    while (list) {
      map.set(list.val, (map.get(list.val) || 0) + 1);
      list = list.next;
    }
  }
  const sorted = [...map].sort(([a], [b]) => a - b);
  const result = new ListNode();
  let tail = result;
```

```
  for (let [key, value] of sorted) {
    while (value--) {
      tail.next = new ListNode(key);
      tail = tail.next;
    }
  }

  return result.next;
};
```

0024 Swap Nodes In Pairs

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 24. Swap Nodes in Pairs
 * https://leetcode.com/problems/swap-nodes-in-pairs/
 * Difficulty: Medium
 *
 * Given a linked list, swap every two adjacent nodes and return its head. You must solve the
 * problem without modifying the values in the list's nodes (i.e., only nodes themselves may
 * be changed.)
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {ListNode}
 */
var swapPairs = function(head) {
  if (!head || !head.next) return head;

  const result = head.next;
  head.next = result.next;
  result.next = head;
  head.next = swapPairs(head.next);

  return result;
};
```

0025 Reverse Nodes In K Group

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 25. Reverse Nodes in k-Group
 * https://leetcode.com/problems/reverse-nodes-in-k-group/
 * Difficulty: Hard
 *
 * Given the head of a linked list, reverse the nodes of the list k at a time,
 * and return the modified list.
 *
 * k is a positive integer and is less than or equal to the length of the linked
 * list. If the number of nodes is not a multiple of k then left-out nodes, in
 * the end, should remain as it is.
 *
 * You may not alter the values in the list's nodes, only nodes themselves may
 * be changed.
 */
```

```
/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @param {number} k
 * @return {ListNode}
 */
var reverseKGroup = function(head, k) {
  const result = new ListNode(null, head);
  const stack = [];
  let tail = result;

  while (head) {
    for (let i = 0; i < k && head; i++) {
      stack.push(head);
      head = head.next;
    }
    if (stack.length === k) {
      while (stack.length) {
        tail.next = stack.pop();
        tail = tail.next;
      }
      tail.next = head;
    }
  }

  return result.next;
};
```

0026 Remove Duplicates From Sorted Array

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 26. Remove Duplicates from Sorted Array
 * https://leetcode.com/problems/remove-duplicates-from-sorted-array/
 * Difficulty: Easy
 *
 * Given an integer array nums sorted in non-decreasing order, remove the
 * duplicates in-place such that each unique element appears only once.
 * The relative order of the elements should be kept the same.
 *
 * Since it is impossible to change the length of the array in some languages,
 * you must instead have the result be placed in the first part of the array
 * nums. More formally, if there are k elements after removing the duplicates,
 * then the first k elements of nums should hold the final result. It does not
 * matter what you leave beyond the first k elements.
 *
 * Return k after placing the final result in the first k slots of nums.
 *
 * Do not allocate extra space for another array. You must do this by modifying
 * the input array in-place with O(1) extra memory.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var removeDuplicates = function(nums) {
  let i = 0;
  for (let j = 0; j < nums.length; j++) {
    if (nums[i] !== nums[j]) {
      nums[++i] = nums[j];
    }
```

```
  }
  return ++i;
};
```

0027 Remove Element

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 27. Remove Element
 * https://leetcode.com/problems/remove-element/
 * Difficulty: Easy
 *
 * Given an integer array nums and an integer val, remove all occurrences of val in nums
in-place.
 * The relative order of the elements may be changed.
 *
 * Since it is impossible to change the length of the array in some languages, you must
instead
 * have the result be placed in the first part of the array nums. More formally, if there are
 * k elements after removing the duplicates, then the first k elements of nums should hold the
 * final result. It does not matter what you leave beyond the first k elements.
 *
 * Return k after placing the final result in the first k slots of nums.
 *
 * Do not allocate extra space for another array. You must do this by modifying the input
 * array in-place with O(1) extra memory.
 */

/**
 * @param {number[]} nums
 * @param {number} val
 * @return {number}
 */
var removeElement = function(nums, val) {
  for (let i = nums.length - 1; i > -1; i--) {
    if (nums[i] === val) nums.splice(i, 1);
  }
};
```

0028 Implement Strstr

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 28. Implement strStr()
 * https://leetcode.com/problems/implement-strstr/
 * Difficulty: Easy
 *
 * Return the index of the first occurrence of needle in haystack, or -1 if needle
 * is not part of haystack.
 *
 * Clarification:
 * - What should we return when needle is an empty string? This is a great question
 *   to ask during an interview.
 *
 * - For the purpose of this problem, we will return 0 when needle is an empty string.
 *   This is consistent to C's strstr() and Java's indexOf().
 */

/**
 * @param {string} haystack
 * @param {string} needle
 * @return {number}
 */
```

```
var strStr = function(haystack, needle) {
  if (!needle) return 0;
  const split = haystack.split(needle);
  return split.length > 1 ? split[0].length : -1;
};
```

0029 Divide Two Integers

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 29. Divide Two Integers
 * https://leetcode.com/problems/divide-two-integers/
 * Difficulty: Medium
 *
 * Given two integers dividend and divisor, divide two integers without using multiplication,
 * division, and mod operator.
 *
 * The integer division should truncate toward zero, which means losing its fractional part.
 * For example, 8.345 would be truncated to 8, and -2.7335 would be truncated to -2.
 *
 * Return the quotient after dividing dividend by divisor.
 *
 * Note: Assume we are dealing with an environment that could only store integers within the
 * 32-bit signed integer range: [−231, 231 − 1]. For this problem, if the quotient is strictly
 * greater than 231 - 1, then return 231 - 1, and if the quotient is strictly less than -231,
 * then return -231.
 */

/**
 * @param {number} dividend
 * @param {number} divisor
 * @return {number}
 */
var divide = function(dividend, divisor) {
  if (divisor === -1 && dividend === Math.pow(-2, 31)) {
    return Math.pow(2, 31) - 1;
  }
  const isNegative = dividend > 0 ^ divisor > 0;
  let result = 0;

  dividend = Math.abs(dividend);
  subtract(Math.abs(divisor), 1);

  function subtract(n, quotient) {
    if (dividend > n) {
      subtract(n * 2, quotient * 2);
    }
    if (dividend >= n) {
      dividend -= n;
      result += quotient;
    }
  }

  return isNegative ? -result : result;
};
```

0030 Substring With Concatenation Of All Words

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 30. Substring with Concatenation of All Words
 * https://leetcode.com/problems/substring-with-concatenation-of-all-words/
 * Difficulty: Hard
```

```
 *
 * You are given a string s and an array of strings words. All the strings of words are of the
 same
 * length.
 *
 * A concatenated substring in s is a substring that contains all the strings of any
permutation of
 * words concatenated.
 *
 * - For example, if words = ["ab","cd","ef"], then "abcdef", "abefcd", "cdabef", "cdefab",
"efabcd",
 * and "efcdab" are all concatenated strings. "acdbef" is not a concatenated substring because
 it is
 * not the concatenation of any permutation of words.
 *
 * Return the starting indices of all the concatenated substrings in s. You can return the
answer in
 * any order.
 */

/**
 * @param {string} s
 * @param {string[]} words
 * @return {number[]}
 */
var findSubstring = function(s, words) {
  if (!words || words.length === 0) {
    return [];
  }

  const result = [];
  const map = {};
  const count = words[0].length;

  words.forEach(word => map[word] = ~~map[word] + 1);

  for (let i = 0; i < s.length - words.length * count + 1; i++) {
    const temp = Object.assign({}, map);

    for (let j = i; j < i + words.length * count; j += count) {
      const key = s.slice(j, j + count);
      if (!temp[key]) {
        break;
      } else if (--temp[key] === 0) {
        delete temp[key];
      }
    }

    if (Object.keys(temp).length === 0) {
      result.push(i);
    }
  }

  return result;
};
```

0031 Next Permutation

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 31. Next Permutation
 * https://leetcode.com/problems/next-permutation/
 * Difficulty: Medium
 *
 * Implement next permutation, which rearranges numbers into the
 * lexicographically next greater permutation of numbers.
 *
 * If such an arrangement is not possible, it must rearrange it
 * as the lowest possible order (i.e., sorted in ascending order).
```

```
 *
 * The replacement must be in place and use only constant extra memory.
 */

/**
 * @param {number[]} nums
 * @return {void} Do not return anything, modify nums in-place instead.
 */
var nextPermutation = function(nums) {
  let i = nums.length - 2;

  while (i >= 0 && nums[i + 1] <= nums[i]) {

      }
    }
  }

  return max;
};
```

0033 Search In Rotated Sorted Array

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 33. Search in Rotated Sorted Array
 * https://leetcode.com/problems/search-in-rotated-sorted-array/
 * Difficulty: Medium
 *
 * There is an integer array nums sorted in ascending order (with distinct values).
 *
 * Prior to being passed to your function, nums is possibly rotated at an unknown pivot
 * index k (1 <= k < nums.length) such that the resulting array is [nums[k], nums[k+1],
 * ..., nums[n-1], nums[0], nums[1], ..., nums[k-1]] (0-indexed). For example, [0,1,2,4,5,6,7]
 * might be rotated at pivot index 3 and become [4,5,6,7,0,1,2].
 *
 * Given the array nums after the possible rotation and an integer target, return the index
 * of target if it is in nums, or -1 if it is not in nums.
 *
 * You must write an algorithm with O(log n) runtime complexity.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number}
 */
var search = function(nums, target) {
  let start = 0;
  let end = nums.length;

      ? nums[i]
      : target < nums[0] ? -Infinity : Infinity;

    if (middle < target) {
      start = i + 1;
    } else if (middle > target) {
      end = i;
    } else {
      return i;
    }
  }

  return -1;
};
```

0034 Find First And Last Position Of Element In Sorted Array

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 34. Find First and Last Position of Element in Sorted Array
 * https://leetcode.com/problems/find-first-and-last-position-of-element-in-sorted-array/
 * Difficulty: Medium
 *
 * Given an array of integers nums sorted in non-decreasing order, find the starting and
 * ending position of a given target value.
 *
 * If target is not found in the array, return [-1, -1].
 *
 * You must write an algorithm with O(log n) runtime complexity.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number[]}
 */
var searchRange = function(nums, target) {
  let start = 0;
  let end = nums.length - 1;

  while (start <= end) {
    const middle = Math.floor((start + end) / 2);
    if (target > nums[middle]) {
      start = middle + 1;
    } else {
      end = middle - 1;
    }
  }

  if (nums[start] !== target) {
    return [-1, -1];
  }

  while (nums[start - 1] === target) start--;
  while (nums[end + 1] === target) end++;

  return [start, end];
};
```

0035 Search Insert Position

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 35. Search Insert Position
 * https://leetcode.com/problems/search-insert-position/
 * Difficulty: Easy
 *
 * Given a sorted array of distinct integers and a target value, return the
 * index if the target is found. If not, return the index where it would be
 * if it were inserted in order.
 *
 * You must write an algorithm with O(log n) runtime complexity.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number}
 */
var searchInsert = function(nums, target) {
  let start = 0;

    const [x, y] = [
      3 * Math.floor(i / 3) + Math.floor(index / 3),
      3 * Math.floor(j / 3) + index % 3,
    ];
    if (board[x][y] === k) {
      return false;
    }
  }

  return true;
}
```

0038 Count And Say

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 38. Count and Say
 * https://leetcode.com/problems/count-and-say/
 * Difficulty: Medium
 *
 * The count-and-say sequence is a sequence of digit strings defined by the recursive formula:
 * - countAndSay(1) = "1"
 * - countAndSay(n) is the way you would "say" the digit string from countAndSay(n-1), which
is
 *   then converted into a different digit string.
 *
 * To determine how you "say" a digit string, split it into the minimal number of substrings
such
 * that each substring contains exactly one unique digit. Then for each substring, say the
number
 * of digits, then say the digit. Finally, concatenate every said digit.
```

```
 *
 * For example, the saying and conversion for digit string "3322251":
 * Given a positive integer n, return the nth term of the count-and-say sequence.
 */

/**
 * @param {number} n
 * @return {string}
 */
var countAndSay = function(n) {

                   .split('—')
                   .map(s => s ? `${s.length}${s[0]}` : '')
                   .join('');
  }

  return result;
};
```

0039 Combination Sum

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 39. Combination Sum
 * https://leetcode.com/problems/combination-sum/
 * Difficulty: Medium
 *
 * Given an array of distinct integers candidates and a target integer target,
 * return a list of all unique combinations of candidates where the chosen
 * numbers sum to target. You may return the combinations in any order.
 *
 * The same number may be chosen from candidates an unlimited number of times.
 * Two combinations are unique if the frequency of at least one of the chosen
 * numbers is different.
 *
 * It is guaranteed that the number of unique combinations that sum up to target
 * is less than 150 combinations for the given input.
 */

/**
 * @param {number[]} candidates
 * @param {number} target
 * @return {number[][]}
 */
var combinationSum = function(candidates, target) {
  const result = [];
  backtrack(result, candidates, target);
  return result;
};

function backtrack(result, candidates, target, combination = [], offset = 0) {

    } else {
      j = start + 1;
      i = offset + 1;
      offset = i;
    }
```

```
  }

  for (let index = j; index < p.length; index++) {
    if (p[index] !== '*') {
      return false;
    }
  }

  return true;
};
```

0045 Jump Game Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 45. Jump Game II
 * https://leetcode.com/problems/jump-game-ii/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array of integers nums of length n.
 * You are initially positioned at nums[0].
 *
 * Each element nums[i] represents the maximum length of a forward
 * jump from index i. In other words, if you are at nums[i], you
 * can jump to any nums[i + j] where:
 * - 0 <= j <= nums[i] and
 * - i + j < n
 *
 * Return the minimum number of jumps to reach nums[n - 1].
 * The test cases are generated such that you can reach nums[n - 1].
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var jump = function(nums) {
  let result = 0;
  let max = 0;
  let previous = 0;

  for (let index = 0; index < nums.length - 1; index++) {
    max = Math.max(max, index + nums[index]);
    if (index === previous) {
      result++;
      previous = max;
    }
  }

  return result;
};
```

0046 Permutations

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 46. Permutations
 * https://leetcode.com/problems/permutations/
 * Difficulty: Medium
 *
 * Given an array nums of distinct integers, return all the possible permutations.
 * You can return the answer in any order.
 */
```

```
/**
 * @param {number[]} nums
 * @return {number[][]}
 */
var permute = function(nums) {
  const result = [];
  backtrack(result, nums);

  }
  const result = tailCopy.next;
```

```
  tailCopy.next = null;
  return result;
};
```

0062 Unique Paths

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 62. Unique Paths
 * https://leetcode.com/problems/unique-paths/
 * Difficulty: Medium
 *
 * There is a robot on an m x n grid. The robot is initially located at the top-left
 * corner (i.e., grid[0][0]). The robot tries to move to the bottom-right corner
 * (i.e., grid[m - 1][n - 1]). The robot can only move either down or right at any
 * point in time.
 *
 * Given the two integers m and n, return the number of possible unique paths that
 * the robot can take to reach the bottom-right corner.
 */

/**
 * @param {number} m
 * @param {number} n
 * @return {number}
 */
var uniquePaths = function(m, n) {
  const row = new Array(n);

  for (let i = 0; i < n; i++) {
    row[i] = 1;
  }

  for (let i = 1; i < m; i++) {
    for (let j = 1; j < n; j++) {
      row[j] += row[j - 1];
    }
  }

  return row[n - 1];
};
```

0063 Unique Paths Ii

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 63. Unique Paths II
 * https://leetcode.com/problems/unique-paths-ii/
 * Difficulty: Medium
 *
 * You are given an m x n integer array grid. There is a robot initially located at
 * the top-left corner (i.e., grid[0][0]). The robot tries to move to the bottom-right
 * corner (i.e., grid[m - 1][n - 1]). The robot can only move either down or right at
 * any point in time.
 *
 * An obstacle and space are marked as 1 or 0 respectively in grid. A path that the
 * robot takes cannot include any square that is an obstacle.
 *
 * Return the number of possible unique paths that the robot can take to reach the
 * bottom-right corner.
 *
 * The testcases are generated so that the answer will be less than or equal to 2 * 109.
 */
```

```
/**
 * @param {number[][]} grid
 * @return {number}
 */
var uniquePathsWithObstacles = function(grid) {
  const cache = new Array(grid.length).fill(0).map(v => new Array(grid[0].length).fill(0));

  function traverse(x, y) {
    if (grid[x] === undefined || grid[x][y] === undefined || grid[x][y] === 1) return 0;
    if (x === grid.length - 1 && y === grid[0].length - 1) return 1;
    if (!cache[x][y]) {
      cache[x][y] = traverse(x + 1, y) + traverse(x, y + 1);
    }
    return cache[x][y];
  }

  return traverse(0, 0);
};
```

0064 Minimum Path Sum

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 64. Minimum Path Sum
 * https://leetcode.com/problems/minimum-path-sum/
 * Difficulty: Medium
 *
 * Given a m x n grid filled with non-negative numbers, find a path from
 * top left to bottom right, which minimizes the sum of all numbers along
 * its path.
 *
 * Note: You can only move either down or right at any point in time.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var minPathSum = function(grid) {
  for (let i = 0; i < grid.length; i++) {
    for (let j = 0; j < grid[0].length; j++) {
      if (i === 0 && j === 0) grid[i][j] = grid[i][j];
      else if (i === 0 && j !== 0) grid[i][j] = grid[i][j] + grid[i][j - 1];
      else if (i !== 0 && j === 0) grid[i][j] = grid[i][j] + grid[i - 1][j];
      else grid[i][j] = grid[i][j] + Math.min(grid[i - 1][j], grid[i][j - 1]);
    }
  }

  return grid[grid.length - 1][grid[0].length - 1];
};
```

0065 Valid Number

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 65. Valid Number
 * https://leetcode.com/problems/valid-number/
 * Difficulty: Hard
 *
 * Given a string s, return whether s is a valid number.
 *
 * For example, all the following are valid numbers: "2", "0089", "-0.1", "+3.14", "4.",
```

```
"-.9",
 * "2e10", "-90E3", "3e+7", "+6e-1", "53.5e93", "-123.456e789", while the following are not
 * valid numbers: "abc", "1a", "1e", "e3", "99e2.5", "--6", "-+3", "95a54e53".
 *
 * Formally, a valid number is defined using one of the following definitions:
 * - An integer number followed by an optional exponent.
 * - A decimal number followed by an optional exponent.
 *
 * An integer number is defined with an optional sign '-' or '+' followed by digits.
 * A decimal number is defined with an optional sign '-' or '+' followed by one of the
 * following definitions:
 * - Digits followed by a dot '.'.
 * - Digits followed by a dot '.' followed by digits.
 * - A dot '.' followed by digits.
 * - An exponent is defined with an exponent notation 'e' or 'E' followed by an integer
number.
 *
 * The digits are defined as one or more digits.
 */

/**
 * @param {string} s
 * @return {boolean}
 */
var isNumber = function(s) {
  return s.trim().length && !isNaN(s.trim()) && !s.includes('Infinity');
};
```

0066 Plus One

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 66. Plus One
 * https://leetcode.com/problems/plus-one/
 * Difficulty: Easy
 *
 * Given a non-empty array of digits representing a non-negative integer,
 * plus one to the integer.
 *
 * The digits are stored such that the most significant digit is at the
 * head of the list, and each element in the array contain a single digit.
 *
 * You may assume the integer does not contain any leading zero,
 * except the number 0 itself.
 */

/**
 * @param {number[]} digits
 * @return {number[]}
 */
var plusOne = function(digits) {
  let i = digits.length - 1;
  digits[i] += 1;
  while (digits[i] > 9) {
    digits[i--] = 0;
    if (digits[i]) {
      digits[i] += 1;
    } else {
      digits.unshift(1);
    }
  }
  return digits;
};

// alternative one-liner that breaks the rules:
/**
 * @param {number[]} digits
 * @return {number[]}
 */
```

```
var plusOne = function(digits) {
  return String(BigInt(digits.join('')) + BigInt(1)).split('');
};
```

0067 Add Binary

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 67. Add Binary
 * https://leetcode.com/problems/add-binary/
 * Difficulty: Easy
 *
 * Given two binary strings, return their sum (also a binary string).
 *
 * The input strings are both non-empty and contains only characters 1 or 0.
 */

/**
 * @param {string} a
 * @param {string} b
 * @return {string}
 */
var addBinary = function(a, b) {
  return (BigInt('0b' + a) + BigInt('0b' + b)).toString(2);
};
```

0068 Text Justification

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 68. Text Justification
 * https://leetcode.com/problems/text-justification/
 * Difficulty: Hard
 *
 * Given an array of strings words and a width maxWidth, format the text such that each
 * line has exactly maxWidth characters and is fully (left and right) justified.
 *
 * You should pack your words in a greedy approach; that is, pack as many words as you
 * can in each line. Pad extra spaces ' ' when necessary so that each line has exactly
 * maxWidth characters.
 *
 * Extra spaces between words should be distributed as evenly as possible. If the number
 * of spaces on a line does not divide evenly between words, the empty slots on the left
 * will be assigned more spaces than the slots on the right.
 *
 * For the last line of text, it should be left-justified, and no extra space is inserted
 * between words.
 *
 * Note:
 * - A word is defined as a character sequence consisting of non-space characters only.
 * - Each word's length is guaranteed to be greater than 0 and not exceed maxWidth.
 * - The input array words contains at least one word.
 */

/**
 * @param {string[]} words
 * @param {number} maxWidth
 * @return {string[]}
 */
var fullJustify = function(words, maxWidth) {
  const result = [[]];
  result[0].count = 0;
```

```
  for (const word of words) {
    let row = result[result.length - 1];
    if (row.length && row.count + row.length + word.length > maxWidth) {
      result.push([]);
      row = result[result.length - 1];
      row.count = 0;
    }
    row.push(word);
    row.count += word.length;
  }

  for (let i = 0; i < result.length; i++) {
    const row = result[i];
    if (row.length === 1 || i === result.length - 1) {
      result[i] = row.join(' ') + ' '.repeat(maxWidth - row.count - row.length + 1);
      continue;
    }

    const min = ' '.repeat(Math.floor((maxWidth - row.count) / (row.length - 1)));
    for (let j = 1; j < row.length; j++) {
      const delimiter = j <= (maxWidth - row.count) % (row.length - 1) ? ' ' : '';
      row[0] += min + delimiter + row[j];
    }

    result[i] = row[0];
  }

  return result;
};
```

0069 Sqrtx

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 69. Sqrt(x)
 * https://leetcode.com/problems/sqrtx/
 * Difficulty: Medium
 *
 * Given a non-negative integer x, return the square root of x rounded down to the nearest
 * integer. The returned integer should be non-negative as well.
 *
 * You must not use any built-in exponent function or operator.
 */

/**
 * @param {number} x
 * @return {number}
 */
var mySqrt = function(x) {
  let result = 1;

  while (result * result <= x) {
    result++;
  }

  return result - 1;
};
```

0070 Climbing Stairs

EASY

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 70. Climbing Stairs
```

```
 * https://leetcode.com/problems/climbing-stairs/
 * Difficulty: Easy
 *
 * You are climbing a staircase. It takes n steps to reach the top.
 *
 * Each time you can either climb 1 or 2 steps. In how many distinct
 * ways can you climb to the top?
 */

/**
 * @param {number} n
 * @return {number}
 */
var climbStairs = function(n) {
  const cache = new Map();
  const memo = n => {
    if (n < 4) return n;
    if (!cache.has(n)) {
      cache.set(n, memo(n - 2) + memo(n - 1));
    }
    return cache.get(n);
  };
  return memo(n);
};
```

0071 Simplify Path

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 71. Simplify Path
 * https://leetcode.com/problems/simplify-path/
 * Difficulty: Medium
 *
 * You are given an absolute path for a Unix-style file system, which always begins
 * with a slash '/'. Your task is to transform this absolute path into its simplified
 * canonical path.
 *
 * The rules of a Unix-style file system are as follows:
 * - A single period '.' represents the current directory.
 * - A double period '..' represents the previous/parent directory.
 * - Multiple consecutive slashes such as '//' and '///' are treated as a single slash '/'.
 * - Any sequence of periods that does not match the rules above should be treated as a
 *   valid directory or file name. For example, '...' and '....' are valid directory or
 *   file names.
 *
 * The simplified canonical path should follow these rules:
 * - The path must start with a single slash '/'.
 * - Directories within the path must be separated by exactly one slash '/'.
 * - The path must not end with a slash '/', unless it is the root directory.
 * - The path must not have any single or double periods ('.' and '..') used to denote
 *   current or parent directories.
 *
 * Return the simplified canonical path.
 */

/**
 * @param {string} path
 * @return {string}
 */
var simplifyPath = function(path) {
  const stack = [];
  for (const segment of path.split('/')) {
    if (segment === '.' || segment === '') continue;
    if (segment === '..') stack.pop();
    else stack.push(segment);
  }
  return `/${stack.join('/')}`;
};
```

0072 Edit Distance

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 72. Edit Distance
 * https://leetcode.com/problems/edit-distance/
 * Difficulty: Medium
 *
 * Given two strings word1 and word2, return the minimum number of operations required to
 * convert word1 to word2.
 *
 * You have the following three operations permitted on a word:
 * - Insert a character
 * - Delete a character
 * - Replace a character
 */

/**
 * @param {string} word1
 * @param {string} word2
 * @return {number}
 */
var minDistance = function(word1, word2) {
  const cache = new Array(word1.length + 1).fill(0).map(() => new Array(word2.length + 1));

  for (let i = 0; i <= word1.length; i++) {
    for (let j = 0; j <= word2.length; j++) {
      if (i === 0) {
        cache[0][j] = j;
      } else if (j === 0) {
        cache[i][0] = i;
      } else if (word1[i - 1] == word2[j - 1]) {
        cache[i][j] = cache[i - 1][j - 1];
      } else {
        cache[i][j] = Math.min(cache[i][j - 1], cache[i - 1][j - 1], cache[i - 1][j]) + 1;
      }
    }
  }

  return cache[word1.length][word2.length];
};
```

0073 Set Matrix Zeroes

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 73. Set Matrix Zeroes
 * https://leetcode.com/problems/set-matrix-zeroes/
 * Difficulty: Medium
 *
 * Given an `m x n` integer `matrix` matrix, if an element is `0`, set its entire
 * row and column to `0`'s, and return the matrix.
 *
 * You must do it in place.
 */

/**
 * @param {number[][]} matrix
 * @return {void} Do not return anything, modify matrix in-place instead.
 */
var setZeroes = function(matrix) {
  const columns = new Set();
  const rows = new Set();
```

```
  matrix.forEach((row, i) => {
    row.forEach((value, j) => {
      if (value === 0) {
        columns.add(i);
        rows.add(j);
      }
    });
  });

  [...columns].forEach(i => matrix[i].forEach((_, j) => matrix[i][j] = 0));
  matrix.forEach((_, i) => [...rows].forEach(j => matrix[i][j] = 0));

  return matrix;
};
```

0074 Search A 2D Matrix

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 74. Search a 2D Matrix
 * https://leetcode.com/problems/search-a-2d-matrix/
 * Difficulty: Medium
 *
 * Write an efficient algorithm that searches for a value in an m x n matrix.
 * This matrix has the following properties:
 *
 * Integers in each row are sorted from left to right.
 * The first integer of each row is greater than the last integer of the previous row.
 */

/**
 * @param {number[][]} matrix
 * @param {number} target
 * @return {boolean}
 */
var searchMatrix = function(matrix, target) {
  return matrix
    .filter(row => row[0] <= target && row[row.length - 1] >= target)
    .find(row => row.includes(target)) !== undefined;
};
```

0075 Sort Colors

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 75. Sort Colors
 * https://leetcode.com/problems/sort-colors/
 * Difficulty: Medium
 *
 * Given an array nums with n objects colored red, white, or blue, sort them in-place so
 * that objects of the same color are adjacent, with the colors in the order red, white,
 * and blue.
 *
 * We will use the integers 0, 1, and 2 to represent the color red, white, and blue,
 * respectively.
 *
 * You must solve this problem without using the library's sort function.
 */

/**
 * @param {number[]} nums
 * @return {void} Do not return anything, modify nums in-place instead.
```

```
 */
var sortColors = function(nums) {
  const count = nums.reduce((a, n) => ++a[n] && a, [0, 0, 0]);
  for (let i = 0, j = 0; i < count.length; i++) {
    for (let k = 0; k < count[i]; k++) {
      nums[j++] = i;
    }
  }
  return nums;
};
```

0076 Minimum Window Substring

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 76. Minimum Window Substring
 * https://leetcode.com/problems/minimum-window-substring/
 * Difficulty: Hard
 *
 * Given two strings s and t of lengths m and n respectively, return the minimum window
substring
 * of s such that every character in t (including duplicates) is included in the window. If
there
 * is no such substring, return the empty string "".
 *
 * The testcases will be generated such that the answer is unique.
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {string}
 */
var minWindow = function(s, t) {
  const values = new Array(128).fill(0);
  let [start, end] = [-Infinity, Infinity];

  for (let i = 0; i < t.length; i++) {
    values[t.charCodeAt(i)]++;
  }

  for (let i = 0, j = 0, total = t.length; i < s.length; i++) {
    if (values[s.charCodeAt(i)] > 0) {
      total--;
    }
    values[s.charCodeAt(i)]--;
    while (!total) {
      if (end - start > i - j) {
        [start, end] = [j, i];
      }
      values[s.charCodeAt(j)]++;
      if (values[s.charCodeAt(j)] > 0) {
        total++;
      }
      j++;
    }
  }

  return end !== Infinity ? s.slice(start, end + 1) : '';
};
```

0077 Combinations

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 77. Combinations
 * https://leetcode.com/problems/combinations/
 * Difficulty: Medium
 *
 * Given two integers n and k, return all possible combinations of k numbers
 * out of the range [1, n].
 *
 * You may return the answer in any order.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {number[][]}
 */
var combine = function(n, k) {
  const result = [];
  backtrack(result, n, k);
  return result;
};

function backtrack(result, n, k, combination = [], offset = 1) {
  if (combination.length === k) {
    result.push(combination);
  } else {
    while (offset <= n) {
      backtrack(result, n, k, [...combination, offset], ++offset);
    }
  }
}
```

0078 Subsets

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 78. Subsets
 * https://leetcode.com/problems/subsets/
 * Difficulty: Medium
 *
 * Given an integer array nums of unique elements, return all possible subsets (the power
set).
 *
 * The solution set must not contain duplicate subsets. Return the solution in any order.
 */

/**
 * @param {number[]} nums
 * @return {number[][]}
 */
var subsets = function(nums) {
  const result = [];
  dfs([], 0);

  function dfs(subset, start) {
    result.push(subset);
    for (let index = start; index < nums.length; index++) {
      dfs([...subset, nums[index]], index + 1);
    }
  }

  return result;
};
```

0079 Word Search

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 79. Word Search
 * https://leetcode.com/problems/word-search/
 * Difficulty: Medium
 *
 * Given an m x n grid of characters board and a string word, return true if word exists
 * in the grid.
 *
 * The word can be constructed from letters of sequentially adjacent cells, where adjacent
 * cells are horizontally or vertically neighboring. The same letter cell may not be used
 * more than once.
 */

/**
 * @param {character[][]} board
 * @param {string} word
 * @return {boolean}
 */
var exist = function(board, word) {
  function backtrack(x, y, k) {
    if (board[x][y] !== word[k]) {
      return false;

      }
    }
  }

  return false;
};
```

0080 Remove Duplicates From Sorted Array Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 80. Remove Duplicates from Sorted Array II
 * https://leetcode.com/problems/remove-duplicates-from-sorted-array-ii/
 * Difficulty: Medium
```

```
 *
 * Given an integer array nums sorted in non-decreasing order, remove some duplicates in-place
 such
 * that each unique element appears at most twice. The relative order of the elements should
be kept
 * the same.
 *
 * Since it is impossible to change the length of the array in some languages, you must
instead have
 * the result be placed in the first part of the array nums. More formally, if there are k
elements
 * after removing the duplicates, then the first k elements of nums should hold the final
result.
 * It does not matter what you leave beyond the first k elements.
 *
 * Return k after placing the final result in the first k slots of nums.
 *
 * Do not allocate extra space for another array. You must do this by modifying the input
array
 * in-place with O(1) extra memory.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */

      offset++;
    }
  }

  return offset;
};
```

0081 Search In Rotated Sorted Array Ii

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 81. Search in Rotated Sorted Array II
 * https://leetcode.com/problems/search-in-rotated-sorted-array-ii/
 * Difficulty: Medium
 *
 * There is an integer array nums sorted in non-decreasing order (not
 * necessarily with distinct values).
 *
 * Before being passed to your function, nums is rotated at an unknown
 * pivot index k (0 <= k < nums.length) such that the resulting array
 * is [nums[k], nums[k+1], ..., nums[n-1], nums[0], nums[1], ..., nums[k-1]]
 * (0-indexed). For example, [0,1,2,4,4,4,5,6,6,7] might be rotated at pivot
 * index 5 and become [4,5,6,6,7,0,1,2,4,4].
 *
 * Given the array nums after the rotation and an integer target, return
 * true if target is in nums, or false if it is not in nums.
 *
 * You must decrease the overall operation steps as much as possible.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {boolean}
 */
var search = function(nums, target) {
  return nums.includes(target);
```

```
};
```

0082 Remove Duplicates From Sorted List Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 82. Remove Duplicates from Sorted List II
 * https://leetcode.com/problems/remove-duplicates-from-sorted-list-ii/
 * Difficulty: Medium
 *
 * Given the head of a sorted linked list, delete all nodes that have duplicate
 * numbers, leaving only distinct numbers from the original list. Return the
 * linked list sorted as well.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {ListNode}
 */
var deleteDuplicates = function(head) {
  const result = new ListNode();
  let previous = null;
  let tail = result;

  while (head) {
    if (head.val !== head.next?.val && head.val !== previous) {
      tail.next = new ListNode(head.val);
      tail = tail.next;
    }
    previous = head.val;
    head = head.next;
  }

  return result.next;
};
```

0083 Remove Duplicates From Sorted List

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 83. Remove Duplicates from Sorted List
 * https://leetcode.com/problems/remove-duplicates-from-sorted-list/
 * Difficulty: Easy
 *
 * Given the head of a sorted linked list, delete all duplicates such that each
 * element appears only once. Return the linked list sorted as well.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
```

```
 * @param {ListNode} head
 * @return {ListNode}
 */
var deleteDuplicates = function(head) {
  const result = new ListNode();
  let tail = result;

  while (head) {
    if (head.val !== head.next?.val) {
      tail.next = new ListNode(head.val);
      tail = tail.next;
    }
    previous = head.val;
    head = head.next;
  }

  return result.next;
};
```

0084 Largest Rectangle In Histogram

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 84. Largest Rectangle in Histogram
 * https://leetcode.com/problems/largest-rectangle-in-histogram/
 * Difficulty: Hard
 *
 * Given an array of integers heights representing the histogram's bar height where the
 * width of each bar is 1, return the area of the largest rectangle in the histogram.
 */

/**
 * @param {number[]} heights
 * @return {number}
 */
var largestRectangleArea = function(heights) {
  const entries = [...heights, 0];
  const stack = [];
  let area = 0;

  for (let i = 0; i < entries.length; i++) {
    let updatedHeight = i;

    while (stack.length && stack[stack.length - 1][1] > entries[i]) {
      const [x, y] = stack.pop();
      area = Math.max(area, (i - x) * y);
      updatedHeight = x;
    }

    stack.push([updatedHeight, entries[i]]);
  }

  return area;
};
```

0085 Maximal Rectangle

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 85. Maximal Rectangle
 * https://leetcode.com/problems/maximal-rectangle/
 * Difficulty: Hard
 *
```

```
 * Given a rows x cols binary matrix filled with 0's and 1's, find the largest rectangle
 * containing only 1's and return its area.
 */

/**
 * @param {character[][]} matrix
 * @return {number}
 */
var maximalRectangle = function(matrix) {
  if (!matrix?.length) return 0;
  let maxArea = 0;

  for (let i = 0; i < matrix.length; i++) {
    for (let j = 0; j < matrix[0].length; j++) {
      if (matrix[i][j] === '1') {
        let minWidth = matrix[0].length;

        for (let k = i; k < matrix.length && matrix[k][j] === '1'; k++) {
          let width = 0;

          while (width < minWidth && j + width < matrix[0].length && matrix[k][j + width] ===
'1') {
            width++;
          }

          minWidth = Math.min(minWidth, width);
          maxArea = Math.max(maxArea, minWidth * (k - i + 1));
        }
      }
    }
  }

  return maxArea;
};
```

0086 Partition List

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 86. Partition List
 * https://leetcode.com/problems/partition-list/
 * Difficulty: Medium
 *
 * Given the head of a linked list and a value x, partition it such that
 * all nodes less than x come before nodes greater than or equal to x.
 *
 * You should preserve the original relative order of the nodes in each
 * of the two partitions.
 */

/**
 * @param {ListNode} head
 * @param {number} x
 * @return {ListNode}
 */
var partition = function(head, x) {
  const result = [];
  const stack = [];

  while (head) {
    const target = head.val >= x ? result : stack;
    target.push(head.val);
    head = head.next;
  }

  return [...stack, ...result].reverse().reduce((a, b) => {
    return new ListNode(b, a);
  }, null);
};
```

0087 Scramble String

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 87. Scramble String
 * https://leetcode.com/problems/scramble-string/
 * Difficulty: Hard
 *
 * We can scramble a string s to get a string t using the following algorithm:
 *
 * 1. If the length of the string is 1, stop.
 * 2. If the length of the string is > 1, do the following:
 *   - Split the string into two non-empty substrings at a random index, i.e., if the string
 *     is s, divide it to x and y where s = x + y.
 *   - Randomly decide to swap the two substrings or to keep them in the same order. i.e.,
 *     after this step, s may become s = x + y or s = y + x.
 *   - Apply step 1 recursively on each of the two substrings x and y.
 *
 * Given two strings s1 and s2 of the same length, return true if s2 is a scrambled string
 * of s1, otherwise, return false.
 */

/**
 * @param {string} s1
 * @param {string} s2
 * @return {boolean}
 */
var isScramble = function(s1, s2) {
  const n = s1.length;
  const dp = new Array(n).fill().map(() => new Array(n).fill().map(() => new
Array(n).fill(null)));

  function dfs(i1, j1, i2) {
    if (dp[i1][j1][i2] !== null) {
      return dp[i1][j1][i2];
    }
    if (i1 == j1) {
      return dp[i1][j1][i2] = s1[i1] === s2[i2];
    }

    const j2 = j1 - i1 + i2;
    let result = false;
    for (let i = i1; i < j1; i++) {
      result = result || (dfs(i1, i, i2) && dfs(i + 1, j1, i2 + i - i1 + 1))
        || (dfs(i1, i, j2 - i + i1) && dfs(i + 1, j1, i2));
    }

    return dp[i1][j1][i2] = result;
  }

  return dfs(0, n - 1, 0);
};
```

0088 Merge Sorted Array

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 88. Merge Sorted Array
 * https://leetcode.com/problems/merge-sorted-array/
 * Difficulty: Easy
 *
 * You are given two integer arrays `nums1` and `nums2`, sorted in non-decreasing order,
 * and two integers `m` and `n`, representing the number of elements in `nums1` and `nums2`
```

```
 * respectively.
 *
 * Merge `nums1` and `nums2` into a single array sorted in non-decreasing order.
 *
 * The final sorted array should not be returned by the function, but instead be
 * stored inside the array `nums1`. To accommodate this, `nums1` has a length of `m + n`,
 * where the first `m` elements denote the elements that should be merged, and the
 * last `n` elements are set to `0` and should be ignored. `nums2` has a length of `n`.
 */

/**
 * @param {number[]} nums1
 * @param {number} m
 * @param {number[]} nums2
 * @param {number} n
 * @return {void} Do not return anything, modify nums1 in-place instead.
 */
var merge = function(nums1, m, nums2, n) {
  let i = m + n - 1;

  m--;
  n--;

  while (n >= 0) {
    nums1[i--] = nums1[m] > nums2[n] ? nums1[m--] : nums2[n--];
  }
};
```

0089 Gray Code

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 89. Gray Code
 * https://leetcode.com/problems/gray-code/
 * Difficulty: Medium
 *
 * An n-bit gray code sequence is a sequence of 2n integers where:
 * - Every integer is in the inclusive range [0, 2n - 1],
 * - The first integer is 0,
 * - An integer appears no more than once in the sequence,
 * - The binary representation of every pair of adjacent integers differs
 *   by exactly one bit, and
 * - The binary representation of the first and last integers differs by
 *   exactly one bit.
 * Given an integer n, return any valid n-bit gray code sequence.
 */

/**
 * @param {number} n
 * @return {number[]}
 */
var grayCode = function(n) {
  const result = [0];
  for (let i = 0; i < n; i++) {
    result.push(...result.map((v) => v | 1 << i).reverse());
  }
  return result;
};
```

0090 Subsets Ii

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 90. Subsets II
 * https://leetcode.com/problems/subsets-ii/
 * Difficulty: Medium
 *
 * Given an integer array nums that may contain duplicates, return all possible subsets (the
power set).
 *
 * The solution set must not contain duplicate subsets. Return the solution in any order.
 */

/**
 * @param {number[]} nums
 * @return {number[][]}
 */
var subsetsWithDup = function(nums) {
  const seen = new Set();
  const result = [];
  dfs([], 0);

  function dfs(subset, start) {
    const key = subset.sort((a, b) => a - b).join('');
    if (!seen.has(key)) {
      result.push(subset);
      seen.add(key);
    }
    for (let index = start; index < nums.length; index++) {
      dfs([...subset, nums[index]], index + 1);
    }
  }

  return result;
};
```

0091 Decode Ways

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 91. Decode Ways
 * https://leetcode.com/problems/decode-ways/
 * Difficulty: Medium
 *
 * You have intercepted a secret message encoded as a string of numbers. The message
 * is decoded via the following mapping:
 * "1" -> 'A'
 * "2" -> 'B'
 * ...
 * "25" -> 'Y'
 * "26" -> 'Z'
 *
 * However, while decoding the message, you realize that there are many different
 * ways you can decode the message because some codes are contained in other codes
 * ("2" and "5" vs "25").
 *
 * For example, "11106" can be decoded into:
 * - "AAJF" with the grouping (1, 1, 10, 6)
 * - "KJF" with the grouping (11, 10, 6)
 * - The grouping (1, 11, 06) is invalid because "06" is not a valid code (only "6"
 *   is valid).
 *
 * Note: there may be strings that are impossible to decode.
 *
 * Given a string s containing only digits, return the number of ways to decode it.
 * If the entire string cannot be decoded in any valid way, return 0.
 *
 * The test cases are generated so that the answer fits in a 32-bit integer.
 */

/**
```

```
 * @param {string} s
 * @return {number}
 */
var numDecodings = function(s) {
  if (s == null || s.length === 0) return 0;
  if (s[0] === '0') return 0;

  const group = new Array(s.length + 1).fill(0);
  group[0] = 1;
  group[1] = 1;

  for (let i = 2; i <= s.length; i++) {
    const a = Number(s.slice(i - 1, i));
    if (a >= 1 && a <= 9) {
      group[i] += group[i - 1];
    }

    const b = Number(s.slice(i - 2, i));
    if (b >= 10 && b <= 26) {
      group[i] += group[i - 2];
    }
  }

  return group[s.length];
};
```

0092 Reverse Linked List Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 92. Reverse Linked List II
 * https://leetcode.com/problems/reverse-linked-list-ii/
 * Difficulty: Medium
 *
 * Given the head of a singly linked list and two integers left and right where
 * left <= right, reverse the nodes of the list from position left to position
 * right, and return the reversed list.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @param {number} left
 * @param {number} right
 * @return {ListNode}
 */
var reverseBetween = function(head, left, right) {
  const result = new ListNode(0, head);
  let previous = result;
  let currentIndex = 1;

  while (currentIndex++ < left) {
    previous = previous.next;
  }

  const tail = previous.next;
  while (left++ < right) {
    const next = tail.next;
    tail.next = next.next;
    next.next = previous.next;
    previous.next = next;
  }
```

```
  return result.next;
};
```

0093 Restore Ip Addresses

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 93. Restore IP Addresses
 * https://leetcode.com/problems/restore-ip-addresses/
 * Difficulty: Medium
 *
 * A valid IP address consists of exactly four integers separated by single
 * dots. Each integer is between 0 and 255 (inclusive) and cannot have
 * leading zeros.
 *
 * For example, "0.1.2.201" and "192.168.1.1" are valid IP addresses, but
 * "0.011.255.245", "192.168.1.312" and "192.168@1.1" are invalid IP addresses.
 *
 * Given a string s containing only digits, return all possible valid IP
 * addresses that can be formed by inserting dots into s. You are not allowed
 * to reorder or remove any digits in s. You may return the valid IP addresses
 * in any order.
 */

/**
 * @param {string} s
 * @return {string[]}
 */
var restoreIpAddresses = function(s) {
  return backtrack([], s);
};

function backtrack(order, string, result = []) {
  const isValid = s => +s <= 255 && `${+s}` === s;

  if (order.length === 3 && isValid(string)) {
    result.push([...order, string].join('.'));
  } else {
    for (let index = 1; index < 4; index++) {
      const sliced = string.slice(0, index);
      if (isValid(sliced)) {
        backtrack([...order, sliced], string.slice(index), result);
      }
    }
  }

  return result;
}
```

0094 Binary Tree Inorder Traversal

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 94. Binary Tree Inorder Traversal
 * https://leetcode.com/problems/binary-tree-inorder-traversal/
 * Difficulty: Easy
 *
 * Given the root of a binary tree, return the inorder traversal of its nodes' values.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
```

```
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number[]}
 */

      if (!large) {
        large = previous;
      } else {
        return false;
      }
    }
    previous = root;
    dfs(root.right);
  }
};
```

0100 Same Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 100. Same Tree
 * https://leetcode.com/problems/same-tree/
 * Difficulty: Easy
 *
 * Given the roots of two binary trees p and q, write a function to check if they are
 * the same or not.
 *
 * Two binary trees are considered the same if they are structurally identical, and
 * the nodes have the same value.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} p
 * @param {TreeNode} q
 * @return {boolean}
 */
var isSameTree = function(p, q) {
  const hasSameValue = p !== null && q !== null && p.val === q.val;
  const hasSameTree = hasSameValue && isSameTree(p.left, q.left) && isSameTree(p.right,
q.right);
  return (p === null && q === null) || hasSameTree;
};
```

0101 Symmetric Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 101. Symmetric Tree
 * https://leetcode.com/problems/symmetric-tree/
 * Difficulty: Easy
 *
 * Given the root of a binary tree, check whether it is a mirror
 * of itself (i.e., symmetric around its center).
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {boolean}
 */
var isSymmetric = function(root) {
  return isBalanced(root.left, root.right);
};

function isBalanced(a, b) {
  if (!a && !b) {
    return true;
  }
  if (!a || !b) {
    return false;
  }
  return a.val === b.val && isBalanced(a.left, b.right) && isBalanced(a.right, b.left);
}
```

0102 Binary Tree Level Order Traversal

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 102. Binary Tree Level Order Traversal
 * https://leetcode.com/problems/binary-tree-level-order-traversal/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, return the level order traversal of its
 * nodes' values. (i.e., from left to right, level by level).
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number[][]}
 */

    return 0;
  }
  const [left, right] = [root.left, root.right].map(maxDepth);
  return 1 + Math.max(left, right);
};
```

0105 Construct Binary Tree From Preorder And Inorder Traversal

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 105. Construct Binary Tree from Preorder and Inorder Traversal
 * https://leetcode.com/problems/construct-binary-tree-from-preorder-and-inorder-traversal/
 * Difficulty: Medium
 *
 * Given two integer arrays preorder and inorder where preorder is the preorder traversal of a
 * binary tree and inorder is the inorder traversal of the same tree, construct and return the
 * binary tree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {number[]} preorder
 * @param {number[]} inorder
 * @return {TreeNode}
 */
var buildTree = function(preorder, inorder) {
  if (!preorder.length || !inorder.length) return null;
```

```
  const root = new TreeNode(preorder[0]);
  const mid = inorder.indexOf(preorder[0]);

  root.left = buildTree(preorder.slice(1, mid + 1), inorder.slice(0, mid));
  root.right = buildTree(preorder.slice(mid + 1), inorder.slice(mid + 1));

  return root;
};
```

0106 Construct Binary Tree From Inorder And Postorder Traversal

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 106. Construct Binary Tree from Inorder and Postorder Traversal
 * https://leetcode.com/problems/construct-binary-tree-from-inorder-and-postorder-traversal/
 * Difficulty: Medium
 *
 * Given two integer arrays inorder and postorder where inorder is the inorder traversal of a
 * binary tree and postorder is the postorder traversal of the same tree, construct and return
 * the binary tree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {number[]} inorder
 * @param {number[]} postorder
 * @return {TreeNode}
 */
var buildTree = function(inorder, postorder) {
  if (inorder.length === 0) return null;

  const root = postorder[postorder.length - 1];
  const index = inorder.indexOf(root);

  return {
    val: root,
    left: buildTree(inorder.slice(0, index), postorder.slice(0, index)),
    right: buildTree(inorder.slice(index + 1), postorder.slice(index, -1))
  };
};
```

0107 Binary Tree Level Order Traversal Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 107. Binary Tree Level Order Traversal II
 * https://leetcode.com/problems/binary-tree-level-order-traversal-ii/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, return the bottom-up level order traversal of its nodes'
values.
 * (i.e., from left to right, level by level from leaf to root).
 */

/**
 * Definition for a binary tree node.
```

```
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number[][]}
 */

  for (let i = triangle.length - 2; i > -1; i--) {
    for (let j = 0; j < triangle[i].length; j++) {
      triangle[i][j] += Math.min( triangle[i + 1][j], triangle[i + 1][j + 1]);
    }
  }

  return triangle[0][0];
};
```

0121 Best Time To Buy And Sell Stock

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 121. Best Time to Buy and Sell Stock
 * https://leetcode.com/problems/best-time-to-buy-and-sell-stock/
 * Difficulty: Easy
 *
 * You are given an array prices where prices[i] is the price of a given stock
 * on the ith day.
 *
 * You want to maximize your profit by choosing a single day to buy one stock
 * and choosing a different day in the future to sell that stock.
```

```
 *
 * Return the maximum profit you can achieve from this transaction. If you
 * cannot achieve any profit, return 0.
 */

/**
 * @param {number[]} prices
 * @return {number}
 */
var maxProfit = function(prices) {
  let max = 0;

  for (let i = 0, min = prices[0]; i < prices.length; i++) {
    min = Math.min(min, prices[i]);
    max = Math.max(max, prices[i] - min);
  }

  return max;
};
```

0122 Best Time To Buy And Sell Stock Ii

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 122. Best Time to Buy and Sell Stock II
 * https://leetcode.com/problems/best-time-to-buy-and-sell-stock-ii/
 * Difficulty: Medium
 *
 * You are given an integer array prices where prices[i] is the price of a given
 * stock on the ith day.
 *
 * On each day, you may decide to buy and/or sell the stock. You can only hold at
 * most one share of the stock at any time. However, you can buy it then immediately
 * sell it on the same day.
 *
 * Find and return the maximum profit you can achieve.
 */

/**
 * @param {number[]} prices
 * @return {number}
 */
var maxProfit = function(prices) {
  return prices.reduce((result, price, i) => {
    return prices[i - 1] < price ? result + (price - prices[i - 1]) : result;
  }, 0);
};
```

0123 Best Time To Buy And Sell Stock Iii

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 123. Best Time to Buy and Sell Stock III
 * https://leetcode.com/problems/best-time-to-buy-and-sell-stock-iii/
 * Difficulty: Hard
 *
 * You are given an array prices where prices[i] is the price of a given stock on the ith day.
 *
 * Find the maximum profit you can achieve. You may complete at most two transactions.
 *
 * Note: You may not engage in multiple transactions simultaneously (i.e., you must sell the
 * stock before you buy again).
 */
```

```
/**

```

0133 Clone Graph

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 133. Clone Graph
 * https://leetcode.com/problems/clone-graph/
 * Difficulty: Medium
 *
 * Given a reference of a node in a connected undirected graph.
 * Return a deep copy (clone) of the graph.
 * Each node in the graph contains a value (int) and a list (List[Node]) of its neighbors.
 *
 * Test case format:
 * - For simplicity, each node's value is the same as the node's index (1-indexed).
 *   For example, the first node with val == 1, the second node with val == 2, and so on.
 *   The graph is represented in the test case using an adjacency list.
 *
 * - An adjacency list is a collection of unordered lists used to represent a finite graph.
 *   Each list describes the set of neighbors of a node in the graph.
 *
 * - The given node will always be the first node with val = 1. You must return the copy of
 *   the given node as a reference to the cloned graph.
 */

/**
 * // Definition for a Node.
 * function Node(val, neighbors) {
 *    this.val = val === undefined ? 0 : val;
 *    this.neighbors = neighbors === undefined ? [] : neighbors;
 * };
 */

/**

    }
  }

  for (let i = ratings.length - 1; i > 0; i--) {
    if (ratings[i - 1] > ratings[i]) {
      data[i - 1] = data[i - 1] > data[i] + 1 ? data[i - 1] : data[i] + 1;
    }
  }

  return data.reduce((sum, n) => sum + n, 0);
};
```

0136 Single Number

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 136. Single Number
 * https://leetcode.com/problems/single-number/
 * Difficulty: Easy
 *
 * Given a non-empty array of integers nums, every element appears twice
 * except for one. Find that single one.
 *
 * You must implement a solution with a linear runtime complexity and
 * use only constant extra space.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var singleNumber = function(nums) {
  return nums.reduce((result, num) => result ^= num, 0);
};
```

0137 Single Number Ii

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 137. Single Number II
 * https://leetcode.com/problems/single-number-ii/
 * Difficulty: Medium
 *
 * Given an integer array nums where every element appears three times except for one, which
appears
 * exactly once. Find the single element and return it.
 *
 * You must implement a solution with a linear runtime complexity and use only constant extra
space.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var singleNumber = function(nums) {
  let a = 0, b = 0;

  nums.forEach(c => {
    const offset = (~a & b & c) | (a & ~b & ~c);
    b = (~a & ~b & c) | (~a & b & ~c);
    a = offset;
  });

  return a | b;
};
```

0138 Copy List With Random Pointer

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 138. Copy List with Random Pointer
 * https://leetcode.com/problems/copy-list-with-random-pointer/
 * Difficulty: Medium
 *
 * A linked list of length n is given such that each node contains an additional random
pointer,
 * which could point to any node in the list, or null.
 *
 * Construct a deep copy of the list. The deep copy should consist of exactly n brand new
nodes,
 * where each new node has its value set to the value of its corresponding original node. Both
 * the next and random pointer of the new nodes should point to new nodes in the copied list
such
 * that the pointers in the original list and copied list represent the same list state. None
of
 * the pointers in the new list should point to nodes in the original list.
 *
 * For example, if there are two nodes X and Y in the original list, where X.random --> Y,
then
 * for the corresponding two nodes x and y in the copied list, x.random --> y.
 *
 * Return the head of the copied linked list.
 *
 * The linked list is represented in the input/output as a list of n nodes. Each node is
 * represented as a pair of [val, random_index] where:
 * - val: an integer representing Node.val
 * - random_index: the index of the node (range from 0 to n-1) that the random pointer points
 *   to, or null if it does not point to any node.
 *
 * Your code will only be given the head of the original linked list.
 */

0139 Word Break

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 139. Word Break
 * https://leetcode.com/problems/word-break/
 * Difficulty: Medium
 *
 * Given a string s and a dictionary of strings wordDict, return true if s can be segmented
into
 * a space-separated sequence of one or more dictionary words.
 *
 * Note that the same word in the dictionary may be reused multiple times in the segmentation.
 */

/**
 * @param {string} s
 * @param {string[]} wordDict
 * @return {boolean}
 */
var wordBreak = function(s, wordDict) {
  const result = [1, ...new Array(s.length + 1).fill(0)];

  for (let i = 1; i <= s.length; i++) {
    for (let j = 0; j < i; j++) {
      if (result[j] && wordDict.includes(s.slice(j, i))) {
        result[i] = 1;
        break;
      }
    }
  }

  return result[s.length];
};
```

0140 Word Break Ii

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 140. Word Break II
 * https://leetcode.com/problems/word-break-ii/
 * Difficulty: Hard
 *
 * Given a string s and a dictionary of strings wordDict, add spaces in s to
 * construct a sentence where each word is a valid dictionary word. Return
 * all such possible sentences in any order.
 *
 * Note that the same word in the dictionary may be reused multiple times in
 * the segmentation.
 */

/**
 * @param {string} s
 * @param {string[]} wordDict
 * @return {string[]}
 */
var wordBreak = function(s, wordDict) {
  const result = [];
  backtrack(result, s, wordDict, '');
  return result;
};

function backtrack(result, s, wordDict, substr) {
  if (!s.length) {
    result.push(substr);
    return;
  }

  wordDict.forEach(word => {
```

```
    if (s.length >= word.length && word === s.substring(0, word.length)) {
      backtrack(
        result,
        s.substring(word.length),
        wordDict,
        substr.length ? `${substr} ${word}` : word,
      );
    }
  });
}
```

0141 Linked List Cycle

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 141. Linked List Cycle
 * https://leetcode.com/problems/linked-list-cycle/
 * Difficulty: Easy
 *
 * Given head, the head of a linked list, determine if the linked list has a cycle in it.
 *
 * There is a cycle in a linked list if there is some node in the list that can be reached
 * again by continuously following the next pointer. Internally, pos is used to denote the
 * index of the node that tail's next pointer is connected to. Note that pos is not passed
 * as a parameter.
 *
 * Return true if there is a cycle in the linked list. Otherwise, return false.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val) {
 *     this.val = val;
 *     this.next = null;
 * }
 */

/**
 * @param {ListNode} head
 * @return {boolean}
 */
var hasCycle = function(head) {
  while (head) {
    if (head.visited) {

 * @return {number[]}
 */
var preorderTraversal = function(root) {
  return root
    ? [root.val, ...preorderTraversal(root.left), ...preorderTraversal(root.right)]
    : [];
};
```

0145 Binary Tree Postorder Traversal

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 145. Binary Tree Postorder Traversal
 * https://leetcode.com/problems/binary-tree-postorder-traversal/
 * Difficulty: Easy
 *
 * Given the root of a binary tree, return the postorder traversal
```

```
 * of its nodes' values.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number[]}
 */
var postorderTraversal = function(root) {
  if (!root) {
    return [];
  }

  return [
    ...postorderTraversal(root.left),
    ...postorderTraversal(root.right),
    root.val
  ];
};
```

0146 Lru Cache

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 146. LRU Cache
 * https://leetcode.com/problems/lru-cache/
 * Difficulty: Medium
 *
 * Design a data structure that follows the constraints of a Least Recently Used (LRU) cache.
 *
 * Implement the LRUCache class:
 * - LRUCache(int capacity) Initialize the LRU cache with positive size capacity.
 * - int get(int key) Return the value of the key if the key exists, otherwise return -1.
 * - void put(int key, int value) Update the value of the key if the key exists. Otherwise,
 *   add the key-value pair to the cache. If the number of keys exceeds the capacity from
 *   this operation, evict the least recently used key.
 *
 * The functions get and put must each run in O(1) average time complexity.
 */

/**
 * @param {number} capacity
 */
var LRUCache = function(capacity) {
  this.cache = new Map();
  this.capacity = capacity;
};

/**
 * @param {number} key
 * @return {number}
 */
LRUCache.prototype.get = function(key) {
  if (!this.cache.has(key)) {
    return -1;
  }

  const value = this.cache.get(key);
  this.cache.delete(key);
  this.cache.set(key, value);
  return this.cache.get(key);
};
```

```
/**
 * @param {number} key
 * @param {number} value
 * @return {void}
 */
LRUCache.prototype.put = function(key, value) {
  if (this.cache.has(key)) {
    this.cache.delete(key);
  }
  this.cache.set(key, value);
  if (this.cache.size > this.capacity) {
    this.cache.delete(this.cache.keys().next().value);
  }
};
```

0147 Insertion Sort List

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 147. Insertion Sort List
 * https://leetcode.com/problems/insertion-sort-list/
 * Difficulty: Medium
 *
 * Given the head of a singly linked list, sort the list using insertion sort, and
 * return the sorted list's head.
 *
 * The steps of the insertion sort algorithm:
 * - Insertion sort iterates, consuming one input element each repetition and growing
 *   a sorted output list.
 * - At each iteration, insertion sort removes one element from the input data, finds
 *   the location it belongs within the sorted list and inserts it there.
 * - It repeats until no input elements remain.
 *
 * The following is a graphical example of the insertion sort algorithm. The partially
 * sorted list (black) initially contains only the first element in the list. One
 * element (red) is removed from the input data and inserted in-place into the sorted
 * list with each iteration.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {ListNode}
 */
var insertionSortList = function(head) {
  const result = new ListNode(0);

  while (head) {
    const tail = head;
    let current = result;
    head = head.next;

    while (current) {
      if (!current.next || tail.val <= current.next.val) {
        [current.next, tail.next] = [tail, current.next];
        break;
      }
      current = current.next;
    }
  }

  return result.next;
```

```
};
```

0148 Sort List

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 148. Sort List
 * https://leetcode.com/problems/sort-list/
 * Difficulty: Medium
 *
 * Given the head of a linked list, return the list after sorting it in ascending order.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {ListNode}
 */
var sortList = function(head) {
  if (!head || !head.next) return head;
  let fast = head;

  const ordered = new ListNode(-1);
  let list = ordered;

  while (a && b) {
    list.next = a.val < b.val ? a : b;
    list = list.next;
    if (a.val < b.val) {
      a = a.next;
    } else {
      b = b.next;
    }
  }

  list.next = a ?? b;
  return ordered.next;
}
```

0149 Max Points On A Line

HARD

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 149. Max Points on a Line
 * https://leetcode.com/problems/max-points-on-a-line/
 * Difficulty: Hard
 *
```

```
 * Given an array of points where points[i] = [xi, yi] represents a point on the X-Y plane,
 * return the maximum number of points that lie on the same straight line.
 */

/**
 * @param {number[][]} points
 * @return {number}
 */
var maxPoints = function(points) {
  let max = 0;

  points.forEach(x => {
    const slopes = new Map();

    points.forEach(y => {
      if (x === y) return;
      const slope = y[0] - x[0] !== 0 ? (y[1] - x[1]) / (y[0] - x[0]) : Infinity;
      slopes.set(slope, (slopes.get(slope) || 0) + 1);
      max = Math.max(max, slopes.get(slope));
    });
  });

  return max + 1;
};
```

0150 Evaluate Reverse Polish Notation

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 150. Evaluate Reverse Polish Notation
 * https://leetcode.com/problems/evaluate-reverse-polish-notation/
 * Difficulty: Medium
 *
 * You are given an array of strings tokens that represents an arithmetic expression in a
 * Reverse Polish Notation.
 *
 * Evaluate the expression. Return an integer that represents the value of the expression.
 *
 * Note that:
 * - The valid operators are '+', '-', '*', and '/'.
 * - Each operand may be an integer or another expression.
 * - The division between two integers always truncates toward zero.
 * - There will not be any division by zero.
 * - The input represents a valid arithmetic expression in a reverse polish notation.
 * - The answer and all the intermediate calculations can be represented in a 32-bit integer.
 */

/**
 * @param {string[]} tokens
 * @return {number}
 */
var evalRPN = function(tokens) {
  const stack = [];
  const operators = {
    '+': (a, b) => a + b,
    '-': (a, b) => a - b,
    '*': (a, b) => a * b,
    '/': (a, b) => a / b >= 0 ? Math.floor(a / b) : Math.ceil(a / b),
  };

  tokens.forEach(token => {
    if (operators[token]) {
      const item = stack.pop();
      stack.push(operators[token](stack.pop(), item));
    } else {
      stack.push(Number(token));
    }
  });
```

```
  return stack.pop();
};
```

0151 Reverse Words In A String

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 151. Reverse Words in a String
 * https://leetcode.com/problems/reverse-words-in-a-string/
 * Difficulty: Medium
 *
 * Given an input string, reverse the string word by word.
 */

/**
 * @param {string} s
 * @return {string}
 */
var reverseWords = function(s) {
  return s.trim().replace(/\s+/g, ' ').split(/\s/).reverse().join(' ');
};
```

0152 Maximum Product Subarray

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 152. Maximum Product Subarray
 * https://leetcode.com/problems/maximum-product-subarray/
 * Difficulty: Medium
 *
 * Given an integer array nums, find the contiguous subarray within an array
 * (containing at least one number) which has the largest product.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var maxProduct = function(nums) {
  let result = nums[0];
  let min = 1;
  let max = 1;
  for (let n of nums) {
    [min, max] = [Math.min(n, min * n, max * n), Math.max(n, min * n, max * n)];
    result = Math.max(result, max);
  }
  return result;
};
```

0153 Find Minimum In Rotated Sorted Array

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 153. Find Minimum in Rotated Sorted Array
 * https://leetcode.com/problems/find-minimum-in-rotated-sorted-array/
 * Difficulty: Medium
```

```
 *
 * Suppose an array of length n sorted in ascending order is rotated between 1 and n times.
 * For example, the array nums = [0,1,2,4,5,6,7] might become:
 * - [4,5,6,7,0,1,2] if it was rotated 4 times.
 * - [0,1,2,4,5,6,7] if it was rotated 7 times.
 *
 * Notice that rotating an array [a[0], a[1], a[2], ..., a[n-1]] 1 time results in the array
 * [a[n-1], a[0], a[1], a[2], ..., a[n-2]].
 *
 * Given the sorted rotated array nums of unique elements, return the minimum element of this
 * array.
 *
 * You must write an algorithm that runs in O(log n) time.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var findMin = function(nums) {
  let left = 0;
  let right = nums.length - 1;

  while (left < right) {
    const mid = Math.floor((left + right) / 2);

    if (nums[mid] <= nums[right]) {
      right = mid;
    } else {
      left = mid + 1;
    }
  }

  return nums[left];
};
```

0154 Find Minimum In Rotated Sorted Array Ii

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 154. Find Minimum in Rotated Sorted Array II
 * https://leetcode.com/problems/find-minimum-in-rotated-sorted-array-ii/
 * Difficulty: Hard
 *
 * Suppose an array of length n sorted in ascending order is rotated between 1 and n times.
 * For example, the array nums = [0,1,4,4,5,6,7] might become:
 * - [4,5,6,7,0,1,4] if it was rotated 4 times.
 * - [0,1,4,4,5,6,7] if it was rotated 7 times.
 *
 * Notice that rotating an array [a[0], a[1], a[2], ..., a[n-1]] 1 time results in the array
 * [a[n-1], a[0], a[1], a[2], ..., a[n-2]].
 *
 * Given the sorted rotated array nums that may contain duplicates, return the minimum element
 * of this array.
 *
 * You must decrease the overall operation steps as much as possible.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var findMin = function(nums) {
  for (let i = 0; i < nums.length - 1; i++) {
    if (nums[i] > nums[i + 1]) {
      return nums[i + 1];
    }
  }
  return nums[0];
```

```
};
```

0155 Min Stack

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 155. Min Stack
 * https://leetcode.com/problems/min-stack/
 * Difficulty: Medium
 *
 * Design a stack that supports push, pop, top, and retrieving the minimum element in constant
 time.
 *
 * Implement the MinStack class:
 * - MinStack() initializes the stack object.
 * - void push(int val) pushes the element val onto the stack.
 * - void pop() removes the element on the top of the stack.
 * - int top() gets the top element of the stack.
 * - int getMin() retrieves the minimum element in the stack.
 *
 * You must implement a solution with O(1) time complexity for each function.
 */

var MinStack = function() {
  this.stack = [];
};

/**
 * @param {number} val
 * @return {void}
 */
MinStack.prototype.push = function(val) {
  this.stack.push({ val, min: this.stack.length ? Math.min(val, this.getMin()) : val });
};

/**
 * @return {void}
 */
MinStack.prototype.pop = function() {
  this.stack.pop();
};

/**
 * @return {number}
 */
MinStack.prototype.top = function() {

};

/**
 * @return {number}
 */
MinStack.prototype.getMin = function() {
  return this.stack.length ? this.stack[this.stack.length - 1].min : 0;
};
```

0156 Binary Tree Upside Down

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 156. Binary Tree Upside Down
 * https://leetcode.com/problems/binary-tree-upside-down/
```

```
 * Difficulty: Medium
 *
 * Given the root of a binary tree, turn the tree upside down and return the new root.
 *
 * You can turn a binary tree upside down with the following steps:
 * - The original left child becomes the new root.
 * - The original root becomes the new right child.
 * - The original right child becomes the new left child.
 *
 * The mentioned steps are done level by level. It is guaranteed that every right node has
 * a sibling (a left node with the same parent) and has no children.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {TreeNode}
 */

        cacheSize = read4(cache);
        cacheIndex = 0;
        if (cacheSize === 0) break;
      }

      buf[charsRead++] = cache[cacheIndex++];
    }

    return charsRead;
  };
};
```

0158 Read N Characters Given Read4 Ii Call Multiple Times

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 158. Read N Characters Given read4 II - Call Multiple Times
 * https://leetcode.com/problems/read-n-characters-given-read4-ii-call-multiple-times/
 * Difficulty: Hard
 *
 * Given a file and assume that you can only read the file using a given method read4,
implement
 * a method read to read n characters. Your method read may be called multiple times.
 *
 * Method read4:
 * - The API read4 reads four consecutive characters from file, then writes those characters
into
 *   the buffer array buf4.
 *
 * The return value is the number of actual characters read.
 *
 * Note that read4() has its own file pointer, much like FILE *fp in C.
 */

/**
 * @param {function} read4()
 * @return {function}
 */
var solution = function(read4) {
  let cache = [];
  let cacheIndex = 0;
  let cacheSize = 0;

  /**
    * @param {character[]} buf Destination buffer
    * @param {number} n Number of characters to read
    * @return {number} The number of actual characters read
    */
  return function(buf, n) {
    let charsRead = 0;

    while (charsRead < n) {
      if (cacheIndex >= cacheSize) {
        cache = new Array(4);
        cacheSize = read4(cache);
        cacheIndex = 0;
        if (cacheSize === 0) break;
      }
```

```
      buf[charsRead++] = cache[cacheIndex++];
    }

    return charsRead;
  };
};
```

0159 Longest Substring With At Most Two Distinct Characters

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 159. Longest Substring with At Most Two Distinct Characters
 * https://leetcode.com/problems/longest-substring-with-at-most-two-distinct-characters/
 * Difficulty: Medium
 *
 * Given a string s, return the length of the longest substring that contains at most two
 * distinct characters.
 */

/**
 * @param {string} s
 * @return {number}
 */
var lengthOfLongestSubstringTwoDistinct = function(s) {
  const map = new Map();
  let maxLength = 0;
  let start = 0;

  for (let end = 0; end < s.length; end++) {
    map.set(s[end], (map.get(s[end]) || 0) + 1);

    while (map.size > 2) {
      map.set(s[start], map.get(s[start]) - 1);
      if (map.get(s[start]) === 0) {
        map.delete(s[start]);
      }
      start++;
    }

    maxLength = Math.max(maxLength, end - start + 1);
  }

  return maxLength;
};
```

0160 Intersection Of Two Linked Lists

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 160. Intersection of Two Linked Lists
 * https://leetcode.com/problems/intersection-of-two-linked-lists/
 * Difficulty: Medium
 *
 * Given the heads of two singly linked-lists headA and headB, return the
 * node at which the two lists intersect. If the two linked lists have no
 * intersection at all, return null.
 *
 * For example, the following two linked lists begin to intersect at node c1:
 */

/**
 * Definition for singly-linked list.
```

```
 * function ListNode(val) {
 *     this.val = val;
 *     this.next = null;
 * }
 */

/**
 * @param {ListNode} headA
 * @param {ListNode} headB
 * @return {ListNode}
 */
var getIntersectionNode = function(headA, headB) {
  if (!headA || !headB) {
    return null;
  }

  let a = headA;
  let b = headB;

  while (a !== b) {
    a = a === null ? headB : a.next;
    b = b === null ? headA : b.next;
  }

  return a;
};
```

0161 One Edit Distance

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 161. One Edit Distance
 * https://leetcode.com/problems/one-edit-distance/
 * Difficulty: Medium
 *
 * Given two strings s and t, return true if they are both one edit distance apart, otherwise
 * return false.
 *
 * A string s is said to be one distance apart from a string t if you can:
 * - Insert exactly one character into s to get t.
 * - Delete exactly one character from s to get t.
 * - Replace exactly one character of s with a different character to get t.
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {boolean}
 */
var isOneEditDistance = function(s, t) {
  if (s === t) return false;
  const sLength = s.length;

  if (Math.abs(sLength - tLength) > 1) return false;

  if (sLength > tLength) return isOneEditDistance(t, s);

  let i = 0;
  while (i < sLength && s[i] === t[i]) i++;

  if (sLength === tLength) {
    return i < sLength && s.slice(i + 1) === t.slice(i + 1);
  }

  return s.slice(i) === t.slice(i + 1);
};
```

0162 Find Peak Element

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 162. Find Peak Element
 * https://leetcode.com/problems/find-peak-element/
 * Difficulty: Medium
 *
 * A peak element is an element that is strictly greater than its neighbors.
 *
 * Given a 0-indexed integer array nums, find a peak element, and return its index.
 * If the array contains multiple peaks, return the index to any of the peaks.
 *
 * You may imagine that nums[-1] = nums[n] = -∞. In other words, an element is
 * always considered to be strictly greater than a neighbor that is outside the array.
 *
 * You must write an algorithm that runs in O(log n) time.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var findPeakElement = function(nums) {
  let left = 0;

  for (let right = nums.length - 1, middle = 0; left < right;) {
    middle = Math.floor((right + left) / 2);
    if (nums[middle] > nums[middle + 1]) {
      right = middle;
    } else {
      left = middle + 1;
    }
  }

  return left;
};
```

0163 Missing Ranges

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 163. Missing Ranges
 * https://leetcode.com/problems/missing-ranges/
 * Difficulty: Easy
 *
 * You are given an inclusive range [lower, upper] and a sorted unique integer array nums,
 * where all elements are within the inclusive range.
 *
 * A number x is considered missing if x is in the range [lower, upper] and x is not in nums.
 *
 * Return the shortest sorted list of ranges that exactly covers all the missing numbers.
 * That is, no element of nums is included in any of the ranges, and each missing number
 * is covered by one of the ranges.
 */

/**
 * @param {number[]} nums
 * @param {number} lower
 * @param {number} upper
 * @return {number[][]}
 */
var findMissingRanges = function(nums, lower, upper) {
```

```
  const result = [];
  let prev = lower - 1;

  for (let i = 0; i <= nums.length; i++) {
    const curr = i < nums.length ? nums[i] : upper + 1;
    if (curr - prev > 1) {
      result.push([prev + 1, curr - 1]);
    }
    prev = curr;
  }

  return result;
};
```

0164 Maximum Gap

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 164. Maximum Gap
 * https://leetcode.com/problems/maximum-gap/
 * Difficulty: Medium
 *
 * Given an integer array nums, return the maximum difference between two successive elements
in
 * its sorted form. If the array contains less than two elements, return 0.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var maximumGap = function(nums) {
  nums.sort((a, b) => a - b);
  let result = 0;
  for (let i = 1; i < nums.length; i++) {
    result = Math.max(result, nums[i] - nums[i - 1]);
  }
  return result;
};
```

0165 Compare Version Numbers

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 165. Compare Version Numbers
 * https://leetcode.com/problems/compare-version-numbers/
 * Difficulty: Medium
 *
 * Given two version strings, version1 and version2, compare them. A version string
 * consists of revisions separated by dots '.'. The value of the revision is its
 * integer conversion ignoring leading zeros.
 *
 * To compare version strings, compare their revision values in left-to-right order.
 * If one of the version strings has fewer revisions, treat the missing revision
 * values as 0.
 *
 * Return the following:
 * - If version1 < version2, return -1.
 * - If version1 > version2, return 1.
 * - Otherwise, return 0.
 */

/**
```

```
 * @param {string} version1
 * @param {string} version2
 * @return {number}
 */
var compareVersion = function(version1, version2) {
  const [v1, v2] = [version1.split(/\./), version2.split(/\./)];

  while (v1.length || v2.length) {
    const [a, b] = [v1.shift(), v2.shift()].map(s => Number(s ?? 0));
    if (a < b) return -1;
    if (a > b) return 1;
  }

  return 0;
};
```

0166 Fraction To Recurring Decimal

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 166. Fraction to Recurring Decimal
 * https://leetcode.com/problems/fraction-to-recurring-decimal/
 * Difficulty: Medium
 *
 * Given two integers representing the numerator and denominator of a fraction, return
 * the fraction in string format.
 *
 * If the fractional part is repeating, enclose the repeating part in parentheses.
 *
 * If multiple answers are possible, return any of them.
 *
 * It is guaranteed that the length of the answer string is less than 104 for all the
 * given inputs.
 */

/**
 * @param {number} numerator
 * @param {number} denominator
 * @return {string}
 */
var fractionToDecimal = function(numerator, denominator) {
  if (numerator === 0) return '0';

  const map = new Map();
  let result = '';

  if (Math.sign(numerator) !== Math.sign(denominator)) {

    if (map.has(diff)) {
      return [map.get(diff) + 1, i + 1];
    }

    map.set(numbers[i], i);
  }
};
```

0168 Excel Sheet Column Title

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 168. Excel Sheet Column Title
 * https://leetcode.com/problems/excel-sheet-column-title/
 * Difficulty: Easy
 *
 * Given an integer columnNumber, return its corresponding column
 * title as it appears in an Excel sheet.
 */

/**
 * @param {number} columnNumber
 * @return {string}
 */
var convertToTitle = function(columnNumber) {
  const n = columnNumber - 1;
  return n >= 0 && n < 26
    ? String.fromCharCode(65 + n)
    : convertToTitle(parseInt(n / 26)) + convertToTitle((n % 26) + 1);
};
```

0169 Majority Element

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 169. Majority Element
 * https://leetcode.com/problems/majority-element/
 * Difficulty: Easy
 *
 * Given an array nums of size n, return the majority element.
 *
 * The majority element is the element that appears more than ■n / 2■ times.
 * You may assume that the majority element always exists in the array.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var majorityElement = function(nums) {
  const map = new Map();
  nums.forEach(n => map.set(n, (map.get(n) || 0) + 1));

  const sorted = [...map].sort(([,a], [,b]) => b - a);
  return sorted[0][0];
};
```

0170 Two Sum Iii Data Structure Design

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 170. Two Sum III - Data structure design
 * https://leetcode.com/problems/two-sum-iii-data-structure-design/
 * Difficulty: Easy
 *
 * Design a data structure that accepts a stream of integers and checks if it has a pair of
 * integers that sum up to a particular value.
 *
 * Implement the TwoSum class:
 * - TwoSum() Initializes the TwoSum object, with an empty array initially.
 * - void add(int number) Adds number to the data structure.
 * - boolean find(int value) Returns true if there exists any pair of numbers whose sum is
equal
 *   to value, otherwise, it returns false.
 */

var TwoSum = function() {
  this.numCount = new Map();
};

/**
 * @param {number} number
 * @return {void}
 */
TwoSum.prototype.add = function(number) {
  this.numCount.set(number, (this.numCount.get(number) || 0) + 1);
};

/**
 * @param {number} value
 * @return {boolean}
 */
TwoSum.prototype.find = function(value) {
  for (const num of this.numCount.keys()) {
```

```
    const complement = value - num;
    if (complement === num) {
      if (this.numCount.get(num) > 1) return true;
    } else if (this.numCount.has(complement)) {
      return true;
    }
  }
  return false;
};
```

0171 Excel Sheet Column Number

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 171. Excel Sheet Column Number
 * https://leetcode.com/problems/excel-sheet-column-number/
 * Difficulty: Easy
 *
 * Given a string columnTitle that represents the column title as appears in
 * an Excel sheet, return its corresponding column number.
 */

/**
 * @param {string} columnTitle
 * @return {number}
 */
var titleToNumber = function(columnTitle) {
  return columnTitle.split('').reduce((result, c, i) => {
    return result + (c.charCodeAt() - 64) * Math.pow(26, columnTitle.length - (i + 1));
  }, 0);
};
```

0172 Factorial Trailing Zeroes

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 172. Factorial Trailing Zeroes
 * https://leetcode.com/problems/factorial-trailing-zeroes/
 * Difficulty: Medium
 *
 * Given an integer n, return the number of trailing zeroes in n!.
 *
 * Note that n! = n * (n - 1) * (n - 2) * ... * 3 * 2 * 1.
 */

/**
 * @param {number} n
 * @return {number}
 */
var trailingZeroes = function(n) {
  return n < 5 ? 0 : Math.floor(n / 5) + trailingZeroes(n / 5);
};
```

0173 Binary Search Tree Iterator

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 173. Binary Search Tree Iterator
 * https://leetcode.com/problems/binary-search-tree-iterator/
 * Difficulty: Medium
 *
 * Implement the BSTIterator class that represents an iterator over the in-order traversal
 * of a binary search tree (BST):
 * - BSTIterator(TreeNode root) Initializes an object of the BSTIterator class. The root of
 *   the BST is given as part of the constructor. The pointer should be initialized to a
 *   non-existent number smaller than any element in the BST.
 * - boolean hasNext() Returns true if there exists a number in the traversal to the right
 *   of the pointer, otherwise returns false.
 * - int next() Moves the pointer to the right, then returns the number at the pointer.
 *
 * Notice that by initializing the pointer to a non-existent smallest number, the first call
 * to next() will return the smallest element in the BST.
 *
 * You may assume that next() calls will always be valid. That is, there will be at least a
 * next number in the in-order traversal when next() is called.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 */
var BSTIterator = function(root) {
  this.stack = [];

    this.stack.push(this.root);
    this.root = this.root.left;
  }
  this.root = this.stack.pop();

  const result = this.root.val;
  this.root = this.root.right;
  return result;
};

/**
 * @return {boolean}
 */
BSTIterator.prototype.hasNext = function() {
  return this.root || this.stack.length;
};
```

0174 Dungeon Game

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 174. Dungeon Game
 * https://leetcode.com/problems/dungeon-game/
 * Difficulty: Hard
 *
 * The demons had captured the princess and imprisoned her in the bottom-right corner of a
dungeon.
```

```
 * The dungeon consists of m x n rooms laid out in a 2D grid. Our valiant knight was initially
 * positioned in the top-left room and must fight his way through dungeon to rescue the
princess.
 *
 * The knight has an initial health point represented by a positive integer. If at any point
his
 * health point drops to 0 or below, he dies immediately.
 *
 * Some of the rooms are guarded by demons (represented by negative integers), so the knight
loses
 * health upon entering these rooms; other rooms are either empty (represented as 0) or
contain
 * magic orbs that increase the knight's health (represented by positive integers).
 *
 * To reach the princess as quickly as possible, the knight decides to move only rightward or
 * downward in each step.
 *
 * Return the knight's minimum initial health so that he can rescue the princess.
 *
 * Note that any room can contain threats or power-ups, even the first room the knight enters
and
 * the bottom-right room where the princess is imprisoned.
 */

/**
 * @param {number[][]} dungeon
 * @return {number}
 */
var calculateMinimumHP = function(dungeon) {
  const dp = new Array(dungeon.length).fill(0).map(() => new
Array(dungeon[0].length).fill(0));
  return traverse(dungeon, dungeon.length, dungeon[0].length, 0, 0, dp);
};

function traverse(dungeon, i, j, row, col, dp) {
  if (row === i - 1 && col === j - 1) {
    return Math.max(1, 1 - dungeon[row][col]);
  } else if (row >= i || col >= j) {
    return Infinity;

```

0179 Largest Number

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 179. Largest Number
 * https://leetcode.com/problems/largest-number/
 * Difficulty: Medium
 *
 * Given a list of non-negative integers nums, arrange them such that they
 * form the largest number.
 *
 * Note: The result may be very large, so you need to return a string
 * instead of an integer.
 */

/**
 * @param {number[]} nums
 * @return {string}
 */
var largestNumber = function(nums) {
  return nums
```

```
    .sort((a, b) => `${b}${a}` - `${a}${b}`)
    .join('')
    .replace(/^0+/, 0);
};
```

0186 Reverse Words In A String Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 186. Reverse Words in a String II
 * https://leetcode.com/problems/reverse-words-in-a-string-ii/
 * Difficulty: Medium
 *
 * Given a character array s, reverse the order of the words.
 *
 * A word is defined as a sequence of non-space characters. The words in s will be separated
 * by a single space.
 *
 * Your code must solve the problem in-place, i.e. without allocating extra space.
 */

/**
 * @param {character[]} s
 * @return {void} Do not return anything, modify s in-place instead.
 */
var reverseWords = function(s) {
  let left = 0;
  let right = s.length - 1;

  while (left < right) {
    [s[left], s[right]] = [s[right], s[left]];
    left++;
    right--;
  }

  left = 0;
  for (let i = 0; i <= s.length; i++) {

      right = i - 1;
      while (left < right) {
        [s[left], s[right]] = [s[right], s[left]];
        left++;
        right--;
      }
      left = i + 1;
    }
  }
};
```

0187 Repeated Dna Sequences

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 187. Repeated DNA Sequences
 * https://leetcode.com/problems/repeated-dna-sequences/
 * Difficulty: Medium
 *
 * The DNA sequence is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and
'T':
 * - For example, "ACGAATTCCG" is a DNA sequence.
 *
 * When studying DNA, it is useful to identify repeated sequences within the DNA.
 *
```

```
 * Given a string s that represents a DNA sequence, return all the 10-letter-long sequences
 * (substrings) that occur more than once in a DNA molecule. You may return the answer in any
order.
 */

/**
 * @param {string} s
 * @return {string[]}
 */
var findRepeatedDnaSequences = function(s) {
  let substring = s.slice(0, 10);
  const set = new Set([substring]);
  const result = new Set();

  for (let i = 10; i < s.length; i++) {
    substring = substring.slice(1) + s[i];
    if (set.has(substring)) {
      result.add(substring);
    }
    set.add(substring);
  }

  return [...result];
};
```

0188 Best Time To Buy And Sell Stock Iv

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 188. Best Time to Buy and Sell Stock IV
 * https://leetcode.com/problems/best-time-to-buy-and-sell-stock-iv/
 * Difficulty: Hard
 *
 * You are given an integer array prices where prices[i] is the price of a given stock on
 * the ith day, and an integer k.
 *
 * Find the maximum profit you can achieve. You may complete at most k transactions: i.e.
 * you may buy at most k times and sell at most k times.
 *
 * Note: You may not engage in multiple transactions simultaneously (i.e., you must sell
 * the stock before you buy again).
 */

/**
 * @param {number} k
 * @param {number[]} prices
 * @return {number}
 */
var maxProfit = function(k, prices) {
  if (prices.length < 2 || k === 0) return 0;

  if (k >= prices.length / 2) {
    let profit = 0;
    for (let i = 1; i < prices.length; i++) {
      profit += prices[i] > prices[i - 1] ? (prices[i] - prices[i - 1]) : 0;
    }
    return profit;

      buy[j] = Math.max(buy[j], sell[j - 1] - prices[i]);
    }
  }

  return sell[k];
```

```
};
```

0189 Rotate Array

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 189. Rotate Array
 * https://leetcode.com/problems/rotate-array/
 * Difficulty: Medium
 *
 * Given an array, rotate the array to the right by k steps, where k is non-negative.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {void} Do not return anything, modify nums in-place instead.
 */
var rotate = function(nums, k) {
  nums.unshift(...nums.splice((k % nums.length) * -1));
};
```

0190 Reverse Bits

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 190. Reverse Bits
 * https://leetcode.com/problems/reverse-bits/
 * Difficulty: Easy
 *
 * Reverse bits of a given 32 bits unsigned integer.
 */

/**
 * @param {number} n - a positive integer
 * @return {number} - a positive integer
 */
var reverseBits = function(n) {
  return parseInt([...n.toString(2)].reverse().join('').padEnd(32, '0'), 2);
};
```

0191 Number Of 1 Bits

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 191. Number of 1 Bits
 * https://leetcode.com/problems/number-of-1-bits/
 * Difficulty: Easy
 *
 * Write a function that takes an unsigned integer and returns the number of
 * '1' bits it has (also known as the Hamming weight).
 */

/**
 * @param {number} n - a positive integer
 * @return {number}
```

```
 */
var hammingWeight = function(n) {
  return n.toString(2).match(/1/g)?.length || 0;
};
```

0198 House Robber

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 198. House Robber
 * https://leetcode.com/problems/house-robber/
 * Difficulty: Medium
 *
 * You are a professional robber planning to rob houses along a street. Each house has a
certain
 * amount of money stashed, the only constraint stopping you from robbing each of them is that
 * adjacent houses have security systems connected and it will automatically contact the
police
 * if two adjacent houses were broken into on the same night.
 *
 * Given an integer array nums representing the amount of money of each house, return the
maximum
 * amount of money you can rob tonight without alerting the police.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var rob = function(nums) {
  let previous = 0;
  let current = 0;

  for (const n of nums) {
    const temp = previous;
    previous = current;
    current = Math.max(temp + n, previous);
  }

  return Math.max(current, previous);
};
```

0199 Binary Tree Right Side View

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 199. Binary Tree Right Side View
 * https://leetcode.com/problems/binary-tree-right-side-view/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, imagine yourself standing on the right side of it, return
the
 * values of the nodes you can see ordered from top to bottom.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
```

```
/**
 * @param {TreeNode} root
 * @return {number[]}
 */
var rightSideView = function(root, result = [], depth = 0) {
  if (!root) return result;
  result[depth] = root.val;
  rightSideView(root.left, result, depth + 1);
  return rightSideView(root.right, result, depth + 1);
};
```

0200 Number Of Islands

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 200. Number of Islands
 * https://leetcode.com/problems/number-of-islands/
 * Difficulty: Medium
 *
 * Given an m x n 2D binary grid grid which represents a map of '1's (land) and '0's (water),
 * return the number of islands.
 *
 * An island is surrounded by water and is formed by connecting adjacent lands horizontally
 * or vertically. You may assume all four edges of the grid are all surrounded by water.
 */

/**
 * @param {character[][]} grid
 * @return {number}
 */
var numIslands = function(grid) {
  let count = 0;

  for (let i = 0; i < grid.length; i++) {
    for (let j = 0; j < grid[i].length; j++) {
      if (grid[i][j] === '1') {
        count++;
        dfs(i, j);
      }
    }
  }

  function dfs(i, j) {
    if (i < 0 || i >= grid.length || j < 0 || j >= grid[i].length || grid[i][j] === '0') {

    }

    grid[i][j] = '0';

    dfs(i + 1, j);
    dfs(i - 1, j);
    dfs(i, j + 1);
    dfs(i, j - 1);
  }

  return count;
};
```

0201 Bitwise And Of Numbers Range

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 201. Bitwise AND of Numbers Range
```

```
 * https://leetcode.com/problems/bitwise-and-of-numbers-range/
 * Difficulty: Medium
 *
 * Given two integers left and right that represent the range [left, right], return the
 * bitwise AND of all numbers in this range, inclusive.
 */

/**
 * @param {number} left
 * @param {number} right
 * @return {number}
 */
var rangeBitwiseAnd = function(left, right) {
  let count = 0;
  while (left !== right) {
    left >>= 1;
    right >>= 1;
    count++;
  }
  return left << count;
};
```

0202 Happy Number

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 202. Happy Number
 * https://leetcode.com/problems/happy-number/
 * Difficulty: Easy
 *
 * Write an algorithm to determine if a number n is happy.
 *
 * A happy number is a number defined by the following process:
 * - Starting with any positive integer, replace the number by the sum of the squares of its
digits.
 * - Repeat the process until the number equals 1 (where it will stay), or it loops endlessly
in a
 *   cycle which does not include 1.
 * - Those numbers for which this process ends in 1 are happy.
 *
 * Return true if n is a happy number, and false if not.
 */

/**
 * @param {number} n
 * @return {boolean}
 */
var isHappy = function(n) {
  while (n !== 1) {
    n = [...String(n)].reduce((sum, digit) => sum + digit ** 2, 0);
    if (n === 4) {
      return false;
    }
  }
  return true;
};
```

0203 Remove Linked List Elements

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 203. Remove Linked List Elements
 * https://leetcode.com/problems/remove-linked-list-elements/
```

```
 * Difficulty: Easy
 *
 * Given the head of a linked list and an integer val, remove all the
 * nodes of the linked list that has Node.val == val, and return the
 * new head.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @param {number} val
 * @return {ListNode}
 */
var removeElements = function(head, val) {
  if (!head) return null;
  head.next = removeElements(head.next, val);
  return head.val === val ? head.next : head;
};
```

0204 Count Primes

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 204. Count Primes
 * https://leetcode.com/problems/count-primes/
 * Difficulty: Medium
 *
 * Given an integer n, return the number of prime numbers that are strictly less than n.
 */

/**
 * @param {number} n
 * @return {number}
 */
var countPrimes = function(n) {
  const nonPrimes = [];
  let result = 0;
  for (let i = 2; i < n; i++) {
    if (!nonPrimes[i]) {
      result++;
      for (let j = 2; i * j < n; j++) {
        nonPrimes[i * j] = 1;
      }
    }
  }
  return result;
};
```

0205 Isomorphic Strings

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 205. Isomorphic Strings
 * https://leetcode.com/problems/isomorphic-strings/
 * Difficulty: Easy
 *
 * Given two strings s and t, determine if they are isomorphic.
```

```
 *
 * Two strings s and t are isomorphic if the characters in s can be replaced to get t.
 *
 * All occurrences of a character must be replaced with another character while preserving
 * the order of characters. No two characters may map to the same character, but a character
 * may map to itself.
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {boolean}
 */
var isIsomorphic = function(s, t) {
  for (let i = 0; i < s.length; i++) {
    if (s.indexOf(s[i], i + 1) !== t.indexOf(t[i], i + 1)) {
      return false;
    }
  }
  return true;
};
```

0206 Reverse Linked List

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 206. Reverse Linked List
 * https://leetcode.com/problems/reverse-linked-list/
 * Difficulty: Easy
 *
 * Given the head of a singly linked list, reverse the list, and return the reversed list.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {ListNode}
 */
var reverseList = function(head) {
  let prev = null;
  let tail = head;

  while (tail) {
    const next = tail.next;
    tail.next = prev;
    prev = tail;
    tail = next;
  }

  return prev;
};
```

0207 Course Schedule

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 207. Course Schedule
```

```
 * https://leetcode.com/problems/course-schedule/
 * Difficulty: Medium
 *
 * There are a total of numCourses courses you have to take, labeled from 0 to numCourses - 1.
 * You are given an array prerequisites where prerequisites[i] = [ai, bi] indicates that you
 * must take course bi first if you want to take course ai.
 *
 * For example, the pair [0, 1], indicates that to take course 0 you have to first take course
 1.
 *
 * Return true if you can finish all courses. Otherwise, return false.
 */

/**
 * @param {number} numCourses
 * @param {number[][]} prerequisites
 * @return {boolean}
 */
var canFinish = function(numCourses, prerequisites) {
  const graph = new Map();
  const seen = new Set();

  prerequisites.forEach(([course, prerequisite]) => {
    graph.set(course, graph.get(course) || []);
    graph.get(course).push(prerequisite);
  });

  function dfs(course) {
    if (seen.has(course)) {

  }

  for (let i = 0; i < numCourses; i++) {
    if (!dfs(i)) {
      return false;
    }
  }

  return true;
};
```

0208 Implement Trie Prefix Tree

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 208. Implement Trie (Prefix Tree)
 * https://leetcode.com/problems/implement-trie-prefix-tree/
 * Difficulty: Medium
 *
 * A trie (pronounced as "try") or prefix tree is a tree data structure used to efficiently
store
 * and retrieve keys in a dataset of strings. There are various applications of this data
structure,
 * such as autocomplete and spellchecker.
 *
 * Implement the Trie class:
 * - Trie() Initializes the trie object.
 * - void insert(String word) Inserts the string word into the trie.
 * - boolean search(String word) Returns true if the string word is in the trie (i.e., was
inserted
 *   before), and false otherwise.
```

```
 * - boolean startsWith(String prefix) Returns true if there is a previously inserted string
word
 *   that has the prefix prefix, and false otherwise.
 */

var Trie = function() {
  this.root = {};
};

/**
 * @param {string} word
 * @return {void}
 */
Trie.prototype.insert = function(word) {
  let node = this.root;
  for (const char of word) {

```

0214 Shortest Palindrome

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 214. Shortest Palindrome
 * https://leetcode.com/problems/shortest-palindrome/
 * Difficulty: Hard
 *
 * You are given a string s. You can convert s to a palindrome by adding characters
 * in front of it.
 *
 * Return the shortest palindrome you can find by performing this transformation.
 */
```

```javascript
/**
 * @param {string} s
 * @return {string}
 */
var shortestPalindrome = function(s) {
  const reversed = s.split('').reverse().join('');
  for (let i = s.length; i > 0; i--) {
    if (s.slice(0, i) === reversed.slice(s.length - i)) {
      return reversed.slice(0, reversed.length - i) + s;
    }
  }
  return '';
};
```

0215 Kth Largest Element In An Array

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```javascript
/**
 * 215. Kth Largest Element in an Array
 * https://leetcode.com/problems/kth-largest-element-in-an-array/
 * Difficulty: Medium
 *
 * Given an integer array nums and an integer k, return the kth largest element in the array.
 *
 * Note that it is the kth largest element in the sorted order, not the kth distinct element.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var findKthLargest = function(nums, k) {
  return nums.sort((a, b) => a - b)[nums.length - k];
};
```

0216 Combination Sum Iii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```javascript
/**
 * 216. Combination Sum III
 * https://leetcode.com/problems/combination-sum-iii/
 * Difficulty: Medium
 *
 * Find all valid combinations of k numbers that sum up to n such that the following
 * conditions are true:
 * - Only numbers 1 through 9 are used.
 * - Each number is used at most once.
 *
 * Return a list of all possible valid combinations. The list must not contain the same
 * combination twice, and the combinations may be returned in any order.
 */

/**
 * @param {number} k
 * @param {number} n
 * @return {number[][]}
 */
var combinationSum3 = function(k, n) {
  const result = [];

  function backtrack(history, sum, start) {
    if (sum > n) return;
```

```
    if (history.length === k && sum === n) {
      result.push(history);
      return;
    }
    for (let i = start; i < 10; i++) {
      backtrack([...history, i], sum + i, i + 1);
    }
  }

  backtrack([], 0, 1);

  return result;
};
```

0217 Contains Duplicate

EASY

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 217. Contains Duplicate
 * https://leetcode.com/problems/contains-duplicate/
 * Difficulty: Easy
 *
 * Given an integer array `nums`, return `true` if any value appears at least
 * twice in the array, and return `false` if every element is distinct.
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */
var containsDuplicate = function(nums) {
  return new Set(nums).size !== nums.length;
};
```

0218 The Skyline Problem

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 218. The Skyline Problem
 * https://leetcode.com/problems/the-skyline-problem/
 * Difficulty: Hard
 *
 * A city's skyline is the outer contour of the silhouette formed by all the buildings in that
 * city when viewed from a distance. Given the locations and heights of all the buildings,
 * return the skyline formed by these buildings collectively.
 *
 * The geometric information of each building is given in the array buildings where
 * buildings[i] = [lefti, righti, heighti]:
 * - lefti is the x coordinate of the left edge of the ith building.
 * - righti is the x coordinate of the right edge of the ith building.
 * - heighti is the height of the ith building.
 *
 * You may assume all buildings are perfect rectangles grounded on an absolutely flat surface
 * at height 0.
 *
 * The skyline should be represented as a list of "key points" sorted by their x-coordinate
 * in the form [[x1,y1],[x2,y2],...]. Each key point is the left endpoint of some horizontal
 * segment in the skyline except the last point in the list, which always has a y-coordinate
 * 0 and is used to mark the skyline's termination where the rightmost building ends. Any
ground
 * between the leftmost and rightmost buildings should be part of the skyline's contour.
 *
 * Note: There must be no consecutive horizontal lines of equal height in the output skyline.
```

```
 * For instance, [...,[2 3],[4 5],[7 5],[11 5],[12 7],...] is not acceptable; the three lines
 * of height 5 should be merged into one in the final output as such: [...,[2 3],[4 5],[12
7],...]
 */

/**
 * @param {number[][]} buildings
 * @return {number[][]}
 */
var getSkyline = function(buildings) {
  const result = [];
  const events = buildings.flatMap(([l, r, h]) => [[l, -h], [r, h]]);

  events.sort((a, b) => a[0] - b[0] || a[1] - b[1]);

  for (let i = 0, previous = 0, heights = [0]; i < events.length; i++) {
    const [x, h] = events[i];
    if (h < 0) {
      heights.push(-h);
    } else {
      heights.splice(heights.indexOf(h), 1);
    }
    const value = Math.max(...heights);
    if (value !== previous) {
      result.push([x, previous = value]);
    }
  }

  return result;
};
```

0219 Contains Duplicate Ii

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 219. Contains Duplicate II
 * https://leetcode.com/problems/contains-duplicate-ii/
 * Difficulty: Easy
 *
 * Given an integer array `nums` and an integer `k`, return `true` if there are
 * two distinct indices `i` and `j` in the array such that `nums[i] == nums[j]`
 * and `abs(i - j) <= k`.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {boolean}
 */
var containsNearbyDuplicate = function(nums, k) {
  const map = new Map();

  for (let i = 0; i < nums.length; i++) {
    if (Math.abs(i - map.get(nums[i])) <= k) {
      return true;
    }
    map.set(nums[i], i);
  }

  return false;
};
```

0220 Contains Duplicate Iii

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 220. Contains Duplicate III
 * https://leetcode.com/problems/contains-duplicate-iii/
 * Difficulty: Hard
 *
 * You are given an integer array nums and two integers indexDiff and valueDiff.
 *
 * Find a pair of indices (i, j) such that:
 * - i != j,
 * - abs(i - j) <= indexDiff.
 * - abs(nums[i] - nums[j]) <= valueDiff, and
 *
 * Return true if such pair exists or false otherwise.
 */

/**
 * @param {number[]} nums
 * @param {number} indexDiff
 * @param {number} valueDiff
 * @return {boolean}
 */
var containsNearbyAlmostDuplicate = function(nums, indexDiff, valueDiff) {
  if (valueDiff < 0) return false;

  const map = new Map();

  for (let i = 0; i < nums.length; i++) {
    const limit = valueDiff + 1;
    const item = Math.floor(nums[i] / limit);

    if (map.has(item)
      || map.has(item - 1) && Math.abs(nums[i] - map.get(item - 1)) < limit
      || map.has(item + 1) && Math.abs(nums[i] - map.get(item + 1)) < limit) {
      return true;
    }

    map.set(item, nums[i]);

    if (i >= indexDiff) {
      map.delete(Math.floor(nums[i - indexDiff] / limit));
    }
  }

  return false;
};
```

0221 Maximal Square

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 221. Maximal Square
 * https://leetcode.com/problems/maximal-square/
 * Difficulty: Medium
 *
 * Given an m x n binary matrix filled with 0's and 1's, find the largest square containing
only
 * 1's and return its area.
 */

/**
 * @param {character[][]} matrix
 * @return {number}
 */
var maximalSquare = function(matrix) {
  const dp = [...new Array(matrix.length + 1)].map(() => new Array(matrix[0].length +
1).fill(0));
```

```
  let max = 0;

  for (let i = 1; i < dp.length; i++) {
    for (let j = 1; j < dp[0].length; j++) {
      if (matrix[i - 1][j - 1] === '1') {
        max = Math.max(max, dp[i][j] = Math.min(dp[i - 1][j], dp[i][j - 1], dp[i - 1][j - 1])
+ 1);
      }
    }
  }

  return max ** 2;
};
```

0222 Count Complete Tree Nodes

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 222. Count Complete Tree Nodes
 * https://leetcode.com/problems/count-complete-tree-nodes/
 * Difficulty: Easy
 *
 * Given the root of a complete binary tree, return the number of the nodes in the tree.
 *
 * According to Wikipedia, every level, except possibly the last, is completely filled
 * in a complete binary tree, and all nodes in the last level are as far left as possible.
 * It can have between 1 and 2h nodes inclusive at the last level h.
 *
 * Design an algorithm that runs in less than O(n) time complexity.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number}
 */
var countNodes = function(root) {
  return !root ? 0 : 1 + countNodes(root.left) + countNodes(root.right);
};
```

0223 Rectangle Area

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 223. Rectangle Area
 * https://leetcode.com/problems/rectangle-area/
 * Difficulty: Medium
 *
 * Given the coordinates of two rectilinear rectangles in a 2D plane, return the total area
 * covered by the two rectangles.
 *
 * The first rectangle is defined by its bottom-left corner (ax1, ay1) and its top-right
corner
 * (ax2, ay2).
 *
 * The second rectangle is defined by its bottom-left corner (bx1, by1) and its top-right
```

```
corner
 * (bx2, by2).
 */

/**
 * @param {number} ax1
 * @param {number} ay1
 * @param {number} ax2
 * @param {number} ay2
 * @param {number} bx1
 * @param {number} by1
 * @param {number} bx2
 * @param {number} by2
 * @return {number}
 */
var computeArea = function(ax1, ay1, ax2, ay2, bx1, by1, bx2, by2) {
  return (ax2 - ax1) * (ay2 - ay1) + (bx2 - bx1) * (by2 - by1)
    - Math.max(0, Math.min(ax2, bx2) - Math.max(ax1, bx1))
    * Math.max(0, Math.min(ay2, by2) - Math.max(ay1, by1));
};
```

0224 Basic Calculator

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 224. Basic Calculator
 * https://leetcode.com/problems/basic-calculator/
 * Difficulty: Hard
 *
 * Given a string s representing a valid expression, implement a basic calculator to
 * evaluate it, and return the result of the evaluation.
 *
 * Note: You are not allowed to use any built-in function which evaluates strings as
 * mathematical expressions, such as eval().
 */

/**
 * @param {string} s
 * @return {number}
 */
var calculate = function(s) {
  const stack = [];
  let result = 0;

  for (let i = 0, sign = 1; i < s.length; i += 1) {
    if (s[i] >= '0' && s[i] <= '9') {
      let value = 0;
      while (s[i] >= '0' && s[i] <= '9') {
        value = (value * 10) + (s[i] - '0');
        i += 1;
      }
      result += value * sign;
      i -= 1;
    } else if (s[i] === '+') {

      else if (sign === '*') stack.push(stack.pop() * num);
      else if (sign === '/') stack.push(Math.trunc(stack.pop() / num));
```

```
      sign = s[i];
      num = 0;
    }
  }

  return stack.reduce((a, b) => a + b, 0);
};
```

0228 Summary Ranges

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 228. Summary Ranges
 * https://leetcode.com/problems/summary-ranges/
 * Difficulty: Easy
 *
 * You are given a sorted unique integer array nums.
 *
 * A range [a,b] is the set of all integers from a to b (inclusive).
 *
 * Return the smallest sorted list of ranges that cover all the numbers in the
 * array exactly. That is, each element of nums is covered by exactly one of
 * the ranges, and there is no integer x such that x is in one of the ranges
 * but not in nums.
 *
 * Each range [a,b] in the list should be output as:
 * - "a->b" if a != b
 * - "a" if a == b
 */

/**
 * @param {number[]} nums
 * @return {string[]}
 */
var summaryRanges = function(nums) {
  const result = [];
  for (let i = 0, n = nums[0]; i < nums.length; i++) {
    if (nums[i] + 1 !== nums[i + 1]) {
      result.push(nums[i] === n ? `${n}` : `${n}->${nums[i]}`);
      n = nums[i + 1];
    }
  }
  return result;
};
```

0229 Majority Element Ii

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 229. Majority Element II
 * https://leetcode.com/problems/majority-element-ii/
 * Difficulty: Medium
 *
 * Given an integer array of size n, find all elements that appear more than ■ n/3 ■ times.
 */

/**
 * @param {number[]} nums
 * @return {number[]}
 */
var majorityElement = function(nums) {
  const map = new Map();
  nums.forEach(n => map.set(n, (map.get(n) || 0) + 1));
```

```
  return [...map]
    .filter(([key, value]) => value > nums.length / 3)
    .map(([key]) => key);
};
```

0230 Kth Smallest Element In A Bst

MEDIUM

APPROACH NOTES

Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 230. Kth Smallest Element in a BST
 * https://leetcode.com/problems/kth-smallest-element-in-a-bst/
 * Difficulty: Medium
 *
 * Given the root of a binary search tree, and an integer k, return the kth smallest value
 * (1-indexed) of all the values of the nodes in the tree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} k
 * @return {number}
 */
var kthSmallest = function(root, k) {
  const result = [];
  dfs(root);
  return result[k - 1];

  function dfs(node) {
    if (!node || result.length > k) return null;
    dfs(node.left);
    result.push(node.val);
    dfs(node.right);
  }
};
```

0231 Power Of Two

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 231. Power of Two
 * https://leetcode.com/problems/power-of-two/
 * Difficulty: Easy
 *
 * Given an integer n, return true if it is a power of two. Otherwise, return false.
 *
 * An integer n is a power of two, if there exists an integer x such that n == 2x.
 */

/**
 * @param {number} n
 * @return {boolean}
 */

};

/**
 * Your MyQueue object will be instantiated and called as such:
 * var obj = new MyQueue()
 * obj.push(x)
 * var param_2 = obj.pop()
 * var param_3 = obj.peek()
 * var param_4 = obj.empty()
 */
```

0233 Number Of Digit One

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 233. Number of Digit One
 * https://leetcode.com/problems/number-of-digit-one/
 * Difficulty: Hard
 *
 * Given an integer n, count the total number of digit 1 appearing in all non-negative
 * integers less than or equal to n.
 */

/**
 * @param {number} n
 * @return {number}
 */
var countDigitOne = function(n) {
  if (n <= 0) {
    return 0;
  } else if (n < 10) {
    return 1;
  }

  const base = 10 ** (n.toString().length - 1);
  const answer = parseInt(n / base);

  return countDigitOne(base - 1) * answer
    + (answer === 1 ? (n - base + 1) : base) + countDigitOne(n % base);
};
```

0234 Palindrome Linked List

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 234. Palindrome Linked List
 * https://leetcode.com/problems/palindrome-linked-list/
 * Difficulty: Easy
 *
 * Given the `head` of a singly linked list, return `true` if it is a palindrome.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 * @return {boolean}
 */
var isPalindrome = function(head) {
  let a = '', b = '';

  while (head) {
    a = a + head.val;
    b = head.val + b;
    head = head.next;
  }

  return a === b;
};
```

0235 Lowest Common Ancestor Of A Binary Search Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 235. Lowest Common Ancestor of a Binary Search Tree
 * https://leetcode.com/problems/lowest-common-ancestor-of-a-binary-search-tree/
 * Difficulty: Easy
 *
 * Given a binary search tree (BST), find the lowest common ancestor (LCA) of two
 * given nodes in the BST.
 *
 * According to the definition of LCA on Wikipedia: “The lowest common ancestor is
 * defined between two nodes p and q as the lowest node in T that has both p and q
 * as descendants (where we allow a node to be a descendant of itself).”
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val) {
 *     this.val = val;
 *     this.left = this.right = null;

 * @param {TreeNode} root
 * @param {TreeNode} p
 * @param {TreeNode} q
 * @return {TreeNode}
 */
var lowestCommonAncestor = function(root, p, q) {
  if (!root || root === p || root === q) return root;
  const [l, r] = [lowestCommonAncestor(root.left, p, q), lowestCommonAncestor(root.right, p,
q)];
  return l && r ? root : l ?? r;
};
```

0237 Delete Node In A Linked List

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 237. Delete Node in a Linked List
 * https://leetcode.com/problems/delete-node-in-a-linked-list/
 * Difficulty: Easy
 *
 * Write a function to delete a node in a singly-linked list. You will not be
 * given access to the head of the list, instead you will be given access to
 * the node to be deleted directly.
 *
 * It is guaranteed that the node to be deleted is not a tail node in the list.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val) {
 *     this.val = val;
 *     this.next = null;
 * }
 */
/**
 * @param {ListNode} node
 * @return {void} Do not return anything, modify node in-place instead.
 */
var deleteNode = function(node) {
  node.val = node.next.val;
  node.next = node.next.next;
};
```

0238 Product Of Array Except Self

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 238. Product of Array Except Self
 * https://leetcode.com/problems/product-of-array-except-self/
 * Difficulty: Medium
 *
 * Given an integer array nums, return an array answer such that answer[i] is equal to the
product
 * of all the elements of nums except nums[i].
 *
 * The product of any prefix or suffix of nums is guaranteed to fit in a 32-bit integer.
 *
 * You must write an algorithm that runs in O(n) time and without using the division
operation.
 */

/**
 * @param {number[]} nums
```

```
 * @return {number[]}
 */
var productExceptSelf = function(nums) {
  const emptyResult = new Array(nums.length).fill(0);
  const zeroCount = nums.filter(n => n === 0).length;
  if (zeroCount > 1) {
    return emptyResult;
  }
  const product = nums.reduce((product, n) => product * (n === 0 ? 1 : n), 1);
  if (zeroCount === 1) {
    emptyResult[nums.indexOf(0)] = product;
    return emptyResult;
  }
  return nums.map(n => product / n);
};
```

0239 Sliding Window Maximum

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 239. Sliding Window Maximum
 * https://leetcode.com/problems/sliding-window-maximum/
 * Difficulty: Hard
 *
 * You are given an array of integers nums, there is a sliding window of size k which is
moving
 * from the very left of the array to the very right. You can only see the k numbers in the
 * window. Each time the sliding window moves right by one position.
 *
 * Return the max sliding window.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number[]}
 */
var maxSlidingWindow = function(nums, k) {
  const result = [];
  const queue = [];

  for (let i = 0; i < nums.length; i++) {
    while (queue.length && queue[0] < i - k + 1) {
      queue.shift();
    }
    while (queue.length && nums[queue[queue.length - 1]] < nums[i]) {
      queue.pop();
    }
    queue.push(i);
    if (i >= k - 1) {
      result.push(nums[queue[0]]);
    }
  }

  return result;
};
```

0240 Search A 2D Matrix Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 240. Search a 2D Matrix II
 * https://leetcode.com/problems/search-a-2d-matrix-ii/
```

```
 * Difficulty: Medium
 *
 * Write an efficient algorithm that searches for a value target in an m x n integer matrix
 * matrix. This matrix has the following properties:
 * - Integers in each row are sorted in ascending from left to right.
 * - Integers in each column are sorted in ascending from top to bottom.
 */

/**
 * @param {number[][]} matrix
 * @param {number} target
 * @return {boolean}
 */
var searchMatrix = function(matrix, target) {
  for (let i = 0, j = matrix[0].length - 1; i < matrix.length && j >= 0;) {
    if (matrix[i][j] === target) {
      return true;
    }
    matrix[i][j] > target ? j-- : i++;
  }
  return false;
};
```

0241 Different Ways To Add Parentheses

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 241. Different Ways to Add Parentheses
 * https://leetcode.com/problems/different-ways-to-add-parentheses/
 * Difficulty: Medium
 *
 * Given a string expression of numbers and operators, return all possible results from
 * computing all the different possible ways to group numbers and operators. You may
 * return the answer in any order.
 *
 * The test cases are generated such that the output values fit in a 32-bit integer and
 * the number of different results does not exceed 104.
 */

/**
 * @param {string} expression
 * @return {number[]}
 */
var diffWaysToCompute = function(expression) {
  const results = [];

  for (let i = 0; i < expression.length; i++) {
    if ('+-*'.includes(expression[i])) {
      const left = diffWaysToCompute(expression.slice(0, i));
      const right = diffWaysToCompute(expression.slice(i + 1));
      left.forEach(l => right.forEach(r =>
        results.push(expression[i] === '+' ? l + r : expression[i] === '-' ? l - r : l * r)));
    }
  }

  return results.length ? results : [+expression];
};
```

0242 Valid Anagram

EASY

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 242. Valid Anagram
```

```
 * https://leetcode.com/problems/valid-anagram/
 * Difficulty: Easy
 *
 * Given two strings s and t, return true if t is an anagram of s, and false otherwise.
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {boolean}
 */
var isAnagram = function(s, t) {
  const sort = str => str.split('').sort().join('');
  return sort(s) === sort(t);
};
```

0243 Shortest Word Distance

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 243. Shortest Word Distance
 * https://leetcode.com/problems/shortest-word-distance/
 * Difficulty: Easy
 *
 * Given an array of strings wordsDict and two different strings that already exist in the
array
 * word1 and word2, return the shortest distance between these two words in the list.
 */

/**
 * @param {string[]} wordsDict
 * @param {string} word1
 * @param {string} word2
 * @return {number}
 */
var shortestDistance = function(wordsDict, word1, word2) {
  let result = Infinity;
  let index1 = -1;
  let index2 = -1;

  for (let i = 0; i < wordsDict.length; i++) {

```

0249 Group Shifted Strings

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 249. Group Shifted Strings
 * https://leetcode.com/problems/group-shifted-strings/
 * Difficulty: Medium
```

```
 *
 * Perform the following shift operations on a string:
 * - Right shift: Replace every letter with the successive letter of the English alphabet,
where
 *   'z' is replaced by 'a'. For example, "abc" can be right-shifted to "bcd" or "xyz" can be
 *   right-shifted to "yza".
 * - Left shift: Replace every letter with the preceding letter of the English alphabet, where
 *   'a' is replaced by 'z'. For example, "bcd" can be left-shifted to "abc" or "yza" can be
 *   left-shifted to "xyz".
 *
 * We can keep shifting the string in both directions to form an endless shifting sequence.
 * - For example, shift "abc" to form the sequence: ... <-> "abc" <-> "bcd" <-> ... <-> "xyz"
 *   <-> "yza" <-> .... <-> "zab" <-> "abc" <-> ...
 *
 * You are given an array of strings strings, group together all strings[i] that belong to the
 same
 * shifting sequence. You may return the answer in any order.
 */

/**
 * @param {string[]} strings
 * @return {string[][]}
 */
var groupStrings = function(strings) {
  const groups = new Map();

  for (const str of strings) {
    const key = getShiftKey(str);
    if (!groups.has(key)) {
      groups.set(key, []);
    }
    groups.get(key).push(str);
  }

  return Array.from(groups.values());

  function getShiftKey(str) {
    if (str.length === 1) return 'single';

```

0256 Paint House

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 256. Paint House
 * https://leetcode.com/problems/paint-house/
 * Difficulty: Medium
 *
 * There is a row of n houses, where each house can be painted one of three colors: red, blue,
 * or green. The cost of painting each house with a certain color is different. You have to
 * paint all the houses such that no two adjacent houses have the same color.
 *
 * The cost of painting each house with a certain color is represented by an n x 3 cost matrix
 * costs.
 * - For example, costs[0][0] is the cost of painting house 0 with the color red; costs[1][2]
 *   is the cost of painting house 1 with color green, and so on...
 *
 * Return the minimum cost to paint all houses.
 */

/**
 * @param {number[][]} costs
 * @return {number}
 */
var minCost = function(costs) {
  let prev = [...costs[0]];

  for (let i = 1; i < costs.length; i++) {
    prev = [
      costs[i][0] + Math.min(prev[1], prev[2]),
      costs[i][1] + Math.min(prev[0], prev[2]),
      costs[i][2] + Math.min(prev[0], prev[1])
    ];
  }

  return Math.min(...prev);
};
```

0257 Binary Tree Paths

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 257. Binary Tree Paths
```

```
 * https://leetcode.com/problems/binary-tree-paths/
 * Difficulty: Easy
 *
 * Given the root of a binary tree, return all root-to-leaf paths in any order.
 *
 * A leaf is a node with no children.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)

  }
  return result;
}
```

0258 Add Digits

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 258. Add Digits
 * https://leetcode.com/problems/add-digits/
 * Difficulty: Easy
 *
 * Given an integer num, repeatedly add all its digits until
 * the result has only one digit, and return it.
 */

/**
 * @param {number} num
 * @return {number}
 */
var addDigits = function(num) {
  return num < 10 ? num : num % 9 === 0 ? 9 : num % 9;
};
```

0259 3Sum Smaller

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 259. 3Sum Smaller
 * https://leetcode.com/problems/3sum-smaller/
```

```
 * Difficulty: Medium
 *
 * Given an array of n integers nums and an integer target, find the number of index triplets
 * i, j, k with 0 <= i < j < k < n that satisfy the condition nums[i] + nums[j] + nums[k] <
target.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number}
 */
var threeSumSmaller = function(nums, target) {
  nums.sort((a, b) => a - b);
  const n = nums.length;
  let result = 0;

  for (let i = 0; i < n - 2; i++) {
    let left = i + 1;
    let right = n - 1;

    while (left < right) {
      const sum = nums[i] + nums[left] + nums[right];
      if (sum < target) {
        result += right - left;
        left++;
      } else {
        right--;
      }
    }
  }

  return result;
};
```

0260 Single Number Iii

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 260. Single Number III
 * https://leetcode.com/problems/single-number-iii/
 * Difficulty: Medium
 *
 * Given an integer array nums, in which exactly two elements appear only once and all
 * the other elements appear exactly twice. Find the two elements that appear only once.
 * You can return the answer in any order.
 */

/**
 * @param {number[]} nums
 * @return {number[]}
 */
var singleNumber = function(nums) {
  const set = new Set();
  nums.forEach(n => set.has(n) ? set.delete(n) : set.add(n));
  return Array.from(set);
};
```

0261 Graph Valid Tree

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 261. Graph Valid Tree
```

```
 * https://leetcode.com/problems/graph-valid-tree/
 * Difficulty: Medium
 *
 * You have a graph of n nodes labeled from 0 to n - 1. You are given an integer n and a list
of
 * edges where edges[i] = [ai, bi] indicates that there is an undirected edge between nodes ai
 * and bi in the graph.
 *
 * Return true if the edges of the given graph make up a valid tree, and false otherwise.
 */

/**
 * @param {number} n
 * @param {number[][]} edges
 * @return {boolean}
 */
var validTree = function(n, edges) {
  const parent = new Array(n).fill(-1);

  for (const [u, v] of edges) {

        used[i] = false;
      }
    }
  }
};
```

0268 Missing Number

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 268. Missing Number
 * https://leetcode.com/problems/missing-number/
 * Difficulty: Easy
 *
 * Given an array `nums` containing `n` distinct numbers in the range `[0, n]`,
 * return the only number in the range that is missing from the array.
 *
 * Follow up: Could you implement a solution using only `O(1)` extra space
```

```
 * complexity and `O(n)` runtime complexity?
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var missingNumber = function(nums) {
  let result = 0;

  for (let i = 0; i < nums.length; i++) {
    result += i + 1 - nums[i];
  }

  return result;
};
```

0269 Alien Dictionary

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 269. Alien Dictionary
 * https://leetcode.com/problems/alien-dictionary/
 * Difficulty: Hard
 *
 * There is a new alien language that uses the English alphabet. However, the order of the
 * letters is unknown to you.
 *
 * You are given a list of strings words from the alien language's dictionary. Now it is
 * claimed that the strings in words are sorted lexicographically by the rules of this new
 * language.
 *
 * If this claim is incorrect, and the given arrangement of string in words cannot correspond
 * to any order of letters, return "".
 *
 * Otherwise, return a string of the unique letters in the new alien language sorted in
 * lexicographically increasing order by the new language's rules. If there are multiple
 * solutions, return any of them.
 */

/**
 * @param {string[]} words
 * @return {string}
 */
var alienOrder = function(words) {

};
```

0270 Closest Binary Search Tree Value

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 270. Closest Binary Search Tree Value
 * https://leetcode.com/problems/closest-binary-search-tree-value/
 * Difficulty: Easy
 *
 * Given the root of a binary search tree and a target value, return the value in the BST that
 * is closest to the target. If there are multiple answers, print the smallest.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} target
 * @return {number}
 */
var closestValue = function(root, target) {
  let closest = root.val;

  while (root) {
    closest = Math.abs(root.val - target) < Math.abs(closest - target)
      || (Math.abs(root.val - target) === Math.abs(closest - target) && root.val < closest)
      ? root.val
      : closest;

    root = target < root.val ? root.left : root.right;
  }

  return closest;
};
```

0271 Encode And Decode Strings

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 271. Encode and Decode Strings
 * https://leetcode.com/problems/encode-and-decode-strings/
 * Difficulty: Medium
 *
 * Design an algorithm to encode a list of strings to a string. The encoded string is then
sent over
 * the network and is decoded back to the original list of strings.
 *
 * Machine 1 (sender) has the function:
 * string encode(vector<string> strs) {
 *   // ... your code
 *   return encoded_string;
 * }
 * Machine 2 (receiver) has the function:
 * vector<string> decode(string s) {
 *   //... your code
 *   return strs;
 * }
 * So Machine 1 does:
 * string encoded_string = encode(strs);
 * and Machine 2 does:
 * vector<string> strs2 = decode(encoded_string);
 * strs2 in Machine 2 should be the same as strs in Machine 1.
 *
 * Implement the encode and decode methods.
 *
 * You are not allowed to solve the problem using any serialize methods (such as eval).
 */

/**
 * Encodes a list of strings to a single string.
 *
 * @param {string[]} strs
 * @return {string}
 */
var encode = function(strs) {
  return strs.map(str => `${str.length}:${str}`).join('');
};

};
```

0277 Find The Celebrity

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 277. Find the Celebrity
 * https://leetcode.com/problems/find-the-celebrity/
 * Difficulty: Medium
 *
 * Suppose you are at a party with n people labeled from 0 to n - 1 and among them, there may
 * exist one celebrity. The definition of a celebrity is that all the other n - 1 people know
 * the celebrity, but the celebrity does not know any of them.
 *
 * Now you want to find out who the celebrity is or verify that there is not one. You are only
 * allowed to ask questions like: "Hi, A. Do you know B?" to get information about whether A
 * knows B. You need to find out the celebrity (or verify there is not one) by asking as few
 * questions as possible (in the asymptotic sense).
 *
 * You are given an integer n and a helper function bool knows(a, b) that tells you whether a
 * knows b. Implement a function int findCelebrity(n). There will be exactly one celebrity if
 * they are at the party.
 *
 * Return the celebrity's label if there is a celebrity at the party. If there is no
celebrity,
 * return -1.
 *
 * Note that the n x n 2D array graph given as input is not directly available to you, and
 * instead only accessible through the helper function knows. graph[i][j] == 1 represents
 * person i knows person j, wherease graph[i][j] == 0 represents person j does not know person
 i.

0278 First Bad Version

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
```

```
 * 278. First Bad Version
 * https://leetcode.com/problems/first-bad-version/
 * Difficulty: Medium
 *
 * You are a product manager and currently leading a team to develop a new product.
 * Unfortunately, the latest version of your product fails the quality check. Since
 * each version is developed based on the previous version, all the versions after
 * a bad version are also bad.
 *
 * Suppose you have n versions [1, 2, ..., n] and you want to find out the first bad
 * one, which causes all the following ones to be bad.
 *
 * You are given an API bool isBadVersion(version) which returns whether version is
 * bad. Implement a function to find the first bad version. You should minimize the
 * number of calls to the API.
 */

/**
 * @param {function} isBadVersion()
 * @return {function}
 */
var solution = function(isBadVersion) {
  /**
   * @param {integer} n Total versions
   * @return {integer} The first bad version
   */
  return n => {
    let left = 1;
    let right = n;

    while (left <= right) {

/**
 * @this ZigzagIterator
 * @returns {integer}
 */
ZigzagIterator.prototype.next = function next() {
  const [vector, index] = this.queue.shift();
  const value = vector[index];

  if (index + 1 < vector.length) {
    this.queue.push([vector, index + 1]);
  }

  return value;
};
```

0282 Expression Add Operators

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 282. Expression Add Operators
 * https://leetcode.com/problems/expression-add-operators/
 * Difficulty: Hard
 *
 * Given a string num that contains only digits and an integer target, return all
possibilities
 * to insert the binary operators '+', '-', and/or '*' between the digits of num so that the
 * resultant expression evaluates to the target value.
 *
 * Note that operands in the returned expressions should not contain leading zeros.
 */

/**
 * @param {string} num
 * @param {number} target
 * @return {string[]}
 */
var addOperators = function(num, target) {
  const result = [];
  backtrack('', 0, 0, 0);
  return result;

  function backtrack(expression, sum, prev, start) {
    if (start === num.length && sum === target) {
      result.push(expression);
      return;
    }
    for (let i = start, str = ''; i < num.length; i++) {
      str += num[i];
      const n = Number(str);
      if (!start) {
        backtrack(str, n, n, i + 1);
        if (str === '0') return;
        continue;
      }
      backtrack(expression + '*' + n, sum - prev + prev * n, prev * n, i + 1);
      backtrack(expression + '+' + n, sum + n, n, i + 1);
      backtrack(expression + '-' + n, sum - n, -n, i + 1);
      if (str === '0') return;
    }
```

```
  }
};
```

0283 Move Zeroes

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 283. Move Zeroes
 * https://leetcode.com/problems/move-zeroes/
 * Difficulty: Easy
 *
 * Given an integer array nums, move all 0's to the end of it while maintaining the
 * relative order of the non-zero elements.
 *
 * Note that you must do this in-place without making a copy of the array.
 */

/**
 * @param {number[]} nums
 * @return {void} Do not return anything, modify nums in-place instead.
 */
var moveZeroes = function(nums) {
  for (let i = 0, j = 0; i < nums.length; i++) {
    if (nums[i] !== 0) {
      [nums[i], nums[j++]] = [nums[j], nums[i]];
    }
  }
};
```

0284 Peeking Iterator

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 284. Peeking Iterator
 * https://leetcode.com/problems/peeking-iterator/
 * Difficulty: Medium
 *
 * Design an iterator that supports the peek operation on an existing iterator in addition to
 * the hasNext and the next operations.
 *
 * Implement the PeekingIterator class:
 * - PeekingIterator(Iterator<int> nums) Initializes the object with the given integer
iterator
 *   iterator.
 * - int next() Returns the next element in the array and moves the pointer to the next
element.
 * - boolean hasNext() Returns true if there are still elements in the array.
 * - int peek() Returns the next element in the array without moving the pointer.
 *
 * Note: Each language may have a different implementation of the constructor and Iterator,
but
 * they all support the int next() and boolean hasNext() functions.
 */

/**
 * @param {Iterator} iterator
 */
var PeekingIterator = function(iterator) {
  this.iterator = iterator;
  this.peekValue = iterator.next();
};

/**
```

```
 * @return {number}
 */

  return this.peekValue;
};

/**
 * @return {number}
 */
PeekingIterator.prototype.next = function() {
  const next = this.peekValue;
  this.peekValue = this.iterator.next();
  return next;
};

/**
 * @return {boolean}
 */
PeekingIterator.prototype.hasNext = function() {
  return this.peekValue > 0;
};
```

0285 Inorder Successor In Bst

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 285. Inorder Successor in BST
 * https://leetcode.com/problems/inorder-successor-in-bst/
 * Difficulty: Medium
 *
 * Given the root of a binary search tree and a node p in it, return the in-order successor of
 * that node in the BST. If the given node has no in-order successor in the tree, return null.
 *
 * The successor of a node p is the node with the smallest key greater than p.val.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val) {
 *     this.val = val;
 *     this.left = this.right = null;
 * }
 */
/**
 * @param {TreeNode} root
 * @param {TreeNode} p
 * @return {TreeNode}
 */
var inorderSuccessor = function(root, p) {
  let successor = null;
  while (root) {
    if (p.val < root.val) {
      successor = root;
      root = root.left;
    } else {
      root = root.right;
    }
  }
  return successor;
};
```

0286 Walls And Gates

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 286. Walls and Gates
 * https://leetcode.com/problems/walls-and-gates/
 * Difficulty: Medium
 *
 * You are given an m x n grid rooms initialized with these three possible values.
 * - -1 A wall or an obstacle.
 * - 0 A gate.
 * - INF Infinity means an empty room. We use the value 231 - 1 = 2147483647 to represent INF
 *   as you may assume that the distance to a gate is less than 2147483647.
 *
 * Fill each empty room with the distance to its nearest gate. If it is impossible to reach
 * a gate, it should be filled with INF.
 */

/**
 * @param {number[][]} rooms
 * @return {void} Do not return anything, modify rooms in-place instead.
 */
var wallsAndGates = function(rooms) {
  const rows = rooms.length;
  const cols = rooms[0].length;
  const queue = [];
  const INF = 2147483647;

  for (let i = 0; i < rows; i++) {
    for (let j = 0; j < cols; j++) {
      if (rooms[i][j] === 0) {
        queue.push([i, j]);
      }
    }
  }

  const directions = [[0, 1], [1, 0], [0, -1], [-1, 0]];
  while (queue.length) {
    const [row, col] = queue.shift();

    for (const [dr, dc] of directions) {
      const newRow = row + dr;
      const newCol = col + dc;

      if (newRow >= 0 && newRow < rows && newCol >= 0 && newCol < cols
          && rooms[newRow][newCol] === INF) {
        rooms[newRow][newCol] = rooms[row][col] + 1;
        queue.push([newRow, newCol]);
      }
    }
  }
};
```

0287 Find The Duplicate Number

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 287. Find the Duplicate Number
 * https://leetcode.com/problems/find-the-duplicate-number/
 * Difficulty: Medium
 *
 * Given an array of integers nums containing n + 1 integers where each integer is in the
 * range [1, n] inclusive.
 *
 * There is only one repeated number in nums, return this repeated number.
 *
 * You must solve the problem without modifying the array nums and using only constant extra
space.
 */

/**
```

```
 * @param {number[]} nums
 * @return {number}
 */
var findDuplicate = function(nums) {
  let slow = nums[0];
  let fast = nums[nums[0]];

  while (slow !== fast) {
    slow = nums[slow];
    fast = nums[nums[fast]];
  }
  slow = 0;
  while (slow !== fast) {
    slow = nums[slow];
    fast = nums[fast];
  }

  return slow;
};
```

0288 Unique Word Abbreviation

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 288. Unique Word Abbreviation
 * https://leetcode.com/problems/unique-word-abbreviation/
 * Difficulty: Medium
 *
 * The abbreviation of a word is a concatenation of its first letter, the number of characters
 * between the first and last letter, and its last letter. If a word has only two characters,
 * then it is an abbreviation of itself.
 *
 * For example:
 * - dog --> d1g because there is one letter between the first letter 'd' and the last letter
'g'.
 * - internationalization --> i18n because there are 18 letters between the first letter 'i'
and
 *   the last letter 'n'.
 * - it --> it because any word with only two characters is an abbreviation of itself.
 *
 * Implement the ValidWordAbbr class:
 * - ValidWordAbbr(String[] dictionary) Initializes the object with a dictionary of words.
 * - boolean isUnique(string word) Returns true if either of the following conditions are met
 *   (otherwise returns false):
 *   - There is no word in dictionary whose abbreviation is equal to word's abbreviation.
 *   - For any word in dictionary whose abbreviation is equal to word's abbreviation, that
word
 *     and word are the same.
 */

/**
 * @param {string[]} dictionary
 */
var ValidWordAbbr = function(dictionary) {
  this.abbrMap = new Map();

  for (const word of dictionary) {
    const abbr = this.getAbbreviation(word);
    if (!this.abbrMap.has(abbr)) {
      this.abbrMap.set(abbr, new Set());
    }
    this.abbrMap.get(abbr).add(word);
  }
};

/**
 * @param {string} word
 * @return {string}
 */
```

```
ValidWordAbbr.prototype.getAbbreviation = function(word) {
  if (word.length <= 2) return word;
  return word[0] + (word.length - 2) + word[word.length - 1];
};

/**
 * @param {string} word
 * @return {boolean}
 */
ValidWordAbbr.prototype.isUnique = function(word) {
  const abbr = this.getAbbreviation(word);
  const words = this.abbrMap.get(abbr);
  return !words || (words.size === 1 && words.has(word));
};
```

0289 Game Of Life

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 289. Game of Life
 * https://leetcode.com/problems/game-of-life/
 * Difficulty: Medium
 *
 * According to Wikipedia's article: "The Game of Life, also known simply as Life, is a
cellular
 * automaton devised by the British mathematician John Horton Conway in 1970."
 *
 * The board is made up of an m x n grid of cells, where each cell has an initial state: live
 * (represented by a 1) or dead (represented by a 0). Each cell interacts with its eight
neighbors
 * (horizontal, vertical, diagonal) using the following four rules (taken from the above
Wikipedia
 * article):
 * 1. Any live cell with fewer than two live neighbors dies as if caused by under-population.
 * 2. Any live cell with two or three live neighbors lives on to the next generation.
 * 3. Any live cell with more than three live neighbors dies, as if by over-population.
 * 4. Any dead cell with exactly three live neighbors becomes a live cell, as if by
reproduction.
 *
 * The next state of the board is determined by applying the above rules simultaneously to
every
 * cell in the current state of the m x n grid board. In this process, births and deaths occur
 * simultaneously.
 *
 * Given the current state of the board, update the board to reflect its next state.
 *
 * Note that you do not need to return anything.
 */

/**
 * @param {number[][]} board
 * @return {void} Do not return anything, modify board in-place instead.
 */
var gameOfLife = function(board) {
  const directions = [[1, -1], [1, 0], [1, 1], [0, -1], [0, 1], [-1, -1], [-1, 0], [-1, 1]];
  const r = board.length;
  const c = board[0].length;

    for (let j = 0; j < c; j++) {
      board[i][j] %= 2;
    }
  }
};
```

0290 Word Pattern

EASY

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 290. Word Pattern
 * https://leetcode.com/problems/word-pattern/
 * Difficulty: Easy
 *
 * Given a pattern and a string s, find if s follows the same pattern.
 *
 * Here follow means a full match, such that there is a bijection between a letter in
 * pattern and a non-empty word in s. Specifically:
 * - Each letter in pattern maps to exactly one unique word in s.
 * - Each unique word in s maps to exactly one letter in pattern.
 * - No two letters map to the same word, and no two words map to the same letter.
 */

/**
 * @param {string} pattern
 * @param {string} s
 * @return {boolean}
 */
var wordPattern = function(pattern, s) {
  const words = s.split(' ');
  if (pattern.length !== words.length) return false;
  const map = new Map();
  return pattern.split('').every((char, i) =>
    map.has(char)
      ? map.get(char) === words[i]
      : !([...map.values()].includes(words[i])) && map.set(char, words[i])
  );
};
```

0291 Word Pattern Ii

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 291. Word Pattern II
 * https://leetcode.com/problems/word-pattern-ii/
 * Difficulty: Medium
 *
 * Given a pattern and a string s, return true if s matches the pattern.
 *
 * A string s matches a pattern if there is some bijective mapping of single characters to
 * non-empty strings such that if each character in pattern is replaced by the string it
 * maps to, then the resulting string is s. A bijective mapping means that no two characters
 * map to the same string, and no character maps to two different strings.
 */
```

```
/**
 * @param {string} pattern
 * @param {string} s
 * @return {boolean}
 */
var wordPatternMatch = function(pattern, s) {
  const charToWord = new Map();
  const usedWords = new Set();

  return backtrack(0, 0);

```

0295 Find Median From Data Stream

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 295. Find Median from Data Stream
 * https://leetcode.com/problems/find-median-from-data-stream/
 * Difficulty: Hard
 *
 * The median is the middle value in an ordered integer list. If the size of the list is
 * even, there is no middle value, and the median is the mean of the two middle values.
 *
 * - For example, for arr = [2,3,4], the median is 3.
 * - For example, for arr = [2,3], the median is (2 + 3) / 2 = 2.5.
 *
 * Implement the MedianFinder class:
 * - MedianFinder() initializes the MedianFinder object.
 * - void addNum(int num) adds the integer num from the data stream to the data structure.
 * - double findMedian() returns the median of all elements so far. Answers within 10-5 of
 *   the actual answer will be accepted.
 */

var MedianFinder = function() {
  this.minHeap = new MinPriorityQueue();
  this.maxHeap = new MaxPriorityQueue();
};

/**
 * @param {number} num
 * @return {void}
 */
MedianFinder.prototype.addNum = function(num) {
  this.minHeap.enqueue(num);
  this.maxHeap.enqueue(this.minHeap.dequeue().element);
  if (this.minHeap.size() < this.maxHeap.size()) {
    this.minHeap.enqueue(this.maxHeap.dequeue().element);
  }
};

/**
 * @return {number}
 */
MedianFinder.prototype.findMedian = function() {
  return this.minHeap.size() > this.maxHeap.size()
    ? this.minHeap.front().element
    : (this.minHeap.front().element + this.maxHeap.front().element) / 2;
};
```

0296 Best Meeting Point

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 296. Best Meeting Point
 * https://leetcode.com/problems/best-meeting-point/
 * Difficulty: Hard
 *
 * Given an m x n binary grid grid where each 1 marks the home of one friend, return the
minimal
 * total travel distance.
 *
 * The total travel distance is the sum of the distances between the houses of the friends and
 * the meeting point.
 *
 * The distance is calculated using Manhattan Distance, where
 * distance(p1, p2) = |p2.x - p1.x| + |p2.y - p1.y|.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var minTotalDistance = function(grid) {
  const rows = [];
  const cols = [];

  for (let i = 0; i < grid.length; i++) {
    for (let j = 0; j < grid[0].length; j++) {
      if (grid[i][j] === 1) {
        rows.push(i);
        cols.push(j);
      }
    }
  }

  rows.sort((a, b) => a - b);
  cols.sort((a, b) => a - b);

  let result = 0;
  for (let i = 0; i < rows.length; i++) {
    result += Math.abs(rows[i] - rows[Math.floor(rows.length / 2)]);
    result += Math.abs(cols[i] - cols[Math.floor(cols.length / 2)]);
  }
  return result;
};
```

0297 Serialize And Deserialize Binary Tree

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 297. Serialize and Deserialize Binary Tree
 * https://leetcode.com/problems/serialize-and-deserialize-binary-tree/
 * Difficulty: Hard
 *
 * Serialization is the process of converting a data structure or object into a sequence of
bits so
 * that it can be stored in a file or memory buffer, or transmitted across a network
connection link
 * to be reconstructed later in the same or another computer environment.
 *
 * Design an algorithm to serialize and deserialize a binary tree. There is no restriction on
how
```

```
 * your serialization/deserialization algorithm should work. You just need to ensure that a
binary
 * tree can be serialized to a string and this string can be deserialized to the original tree
 * structure.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val) {
 *     this.val = val;
 *     this.left = this.right = null;
 * }
 */

/**
 * Encodes a tree to a single string.
 *
 * @param {TreeNode} root
 * @return {string}
 */
var serialize = function(root) {
  return JSON.stringify(root);
};

/**
 * Decodes your encoded data to tree.
 *
 * @param {string} data
 * @return {TreeNode}
 */
var deserialize = function(data) {
  return JSON.parse(data);
};
```

0298 Binary Tree Longest Consecutive Sequence

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 298. Binary Tree Longest Consecutive Sequence
 * https://leetcode.com/problems/binary-tree-longest-consecutive-sequence/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, return the length of the longest consecutive sequence
path.
 *
 * A consecutive sequence path is a path where the values increase by one along the path.
 *
 * Note that the path can start at any node in the tree, and you cannot go from a node to its
 * parent in the path.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number}
 */
var longestConsecutive = function(root) {
  let result = 0;
  traverse(root, root.val - 1, 0);
  return result;

  function traverse(node, parentValue, length) {
```

```
    if (!node) return;

    const currentLength = parentValue + 1 === node.val ? length + 1 : 1;
    result = Math.max(result, currentLength);

    traverse(node.left, node.val, currentLength);
    traverse(node.right, node.val, currentLength);
  }
};
```

0299 Bulls And Cows

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 299. Bulls and Cows
 * https://leetcode.com/problems/bulls-and-cows/
 * Difficulty: Medium
 *
 * You are playing the Bulls and Cows game with your friend.
 *
 * You write down a secret number and ask your friend to guess what the number is.
 * When your friend makes a guess, you provide a hint with the following info:
 * - The number of "bulls", which are digits in the guess that are in the correct position.
 * - The number of "cows", which are digits in the guess that are in your secret number but
 *   are located in the wrong position. Specifically, the non-bull digits in the guess that
 *   could be rearranged such that they become bulls.
 *
 * Given the secret number secret and your friend's guess guess, return the hint for your
 * friend's guess.
 *
 * The hint should be formatted as "xAyB", where x is the number of bulls and y is the number
 * of cows. Note that both secret and guess may contain duplicate digits.
 */

/**
 * @param {string} secret
 * @param {string} guess
 * @return {string}
 */
var getHint = function(secret, guess) {
  const map = Array(10).fill(0);
  let a = 0;
  let b = 0;

  for (const i in secret) {
    if (secret[i] === guess[i]) {
      a++;
    } else {
      map[secret[i]]++;
      map[guess[i]]--;
      b += map[secret[i]] <= 0;
      b += map[guess[i]] >= 0;
    }
  }

  return `${a}A${b}B`;
};
```

0300 Longest Increasing Subsequence

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 300. Longest Increasing Subsequence
```

```
 * https://leetcode.com/problems/longest-increasing-subsequence/
 * Difficulty: Medium
 *
 * Given an integer array nums, return the length of the longest strictly increasing
subsequence.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var lengthOfLIS = function(nums) {
  if (!nums.length) return 0;

  const dp = new Array(nums.length).fill(1);
  for (let i = 1; i < nums.length; i++) {
    for (let j = 0; j < i; j++) {
      if (nums[i] > nums[j]) {

0309 Best Time To Buy And Sell Stock With Cooldown

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 309. Best Time to Buy and Sell Stock with Cooldown
 * https://leetcode.com/problems/best-time-to-buy-and-sell-stock-with-cooldown/
 * Difficulty: Medium
 *
 * You are given an array prices where prices[i] is the price of a given stock on the ith day.
 *
 * Find the maximum profit you can achieve. You may complete as many transactions as you like
 * (i.e., buy one and sell one share of the stock multiple times) with the following
restrictions:
 * - After you sell your stock, you cannot buy stock on the next day (i.e., cooldown one day).
 *
 * Note: You may not engage in multiple transactions simultaneously (i.e., you must sell the
stock
 * before you buy again).
 */

/**
 * @param {number[]} prices
 * @return {number}
 */
var maxProfit = function(prices) {
  let result = 0;

    result = limit + prices[i];
  }

  return Math.max(result, remaining);
};
```

0310 Minimum Height Trees

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 310. Minimum Height Trees
 * https://leetcode.com/problems/minimum-height-trees/
 * Difficulty: Medium
 *
 * A tree is an undirected graph in which any two vertices are connected by exactly one
 * path. In other words, any connected graph without simple cycles is a tree.
 *
 * Given a tree of n nodes labelled from 0 to n - 1, and an array of n - 1 edges where
 * edges[i] = [ai, bi] indicates that there is an undirected edge between the two nodes
 * ai and bi in the tree, you can choose any node of the tree as the root. When you select
 * a node x as the root, the result tree has height h. Among all possible rooted trees,
 * those with minimum height (i.e. min(h))  are called minimum height trees (MHTs).
 *
 * Return a list of all MHTs' root labels. You can return the answer in any order.
 *
 * The height of a rooted tree is the number of edges on the longest downward path
 * between the root and a leaf.
 */

/**
```

```
 * @param {number} n
 * @param {number[][]} edges
 * @return {number[]}
 */

```

0318 Maximum Product Of Word Lengths

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 318. Maximum Product of Word Lengths
 * https://leetcode.com/problems/maximum-product-of-word-lengths/
 * Difficulty: Medium
 *
 * Given a string array words, return the maximum value of length(word[i]) * length(word[j])
 * where the two words do not share common letters. If no such two words exist, return 0.
 */

/**
 * @param {string[]} words
 * @return {number}
 */
var maxProduct = function(words) {
  const letters = words.map(word => Array.from(new Set(word)));
  let result = 0;

  for (let i = 0; i < words.length - 1; i++) {
    for (let j = i + 1; j < words.length; j++) {
      if (!letters[i].some(item => letters[j].includes(item))) {
        const product = words[i].length * words[j].length;
        if (product > result) {
          result = product;
        }
      }
    }
  }

  return result;
};
```

0319 Bulb Switcher

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 319. Bulb Switcher
 * https://leetcode.com/problems/bulb-switcher/
 * Difficulty: Medium
 *
 * There are n bulbs that are initially off. You first turn on all the bulbs, then you turn
 * off every second bulb.
 *
 * On the third round, you toggle every third bulb (turning on if it's off or turning off if
 * it's on). For the ith round, you toggle every i bulb. For the nth round, you only toggle
 * the last bulb.
 *
 * Return the number of bulbs that are on after n rounds.
 */

/**
 * @param {number} n
 * @return {number}
 */
var bulbSwitch = function(n) {
  return Math.floor(n ** 0.5);
};
```

0320 Generalized Abbreviation

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 320. Generalized Abbreviation
 * https://leetcode.com/problems/generalized-abbreviation/
 * Difficulty: Medium
 *
 * A word's generalized abbreviation can be constructed by taking any number of
non-overlapping
 * and non-adjacent substrings and replacing them with their respective lengths.
 * - For example, "abcde" can be abbreviated into:
 *   - "a3e" ("bcd" turned into "3")
 *   - "1bcd1" ("a" and "e" both turned into "1")
 *   - "5" ("abcde" turned into "5")
 *   - "abcde" (no substrings replaced)
 * - However, these abbreviations are invalid:
 *   - "23" ("ab" turned into "2" and "cde" turned into "3") is invalid as the substrings
 *     chosen are adjacent.
 *   - "22de" ("ab" turned into "2" and "bc" turned into "2") is invalid as the substring
 *     chosen overlap.
 *
 * Given a string word, return a list of all the possible generalized abbreviations of word.
 * Return the answer in any order.
 */

/**
 * @param {string} word
 * @return {string[]}
 */
var generateAbbreviations = function(word) {
  const result = [];
  backtrack('', 0, 0);
  return result;

  function backtrack(current, pos, count) {
    if (pos === word.length) {
```

```
      result.push(current + (count > 0 ? count : ''));
      return;
    }

    backtrack(current + (count > 0 ? count : '') + word[pos], pos + 1, 0);
    backtrack(current, pos + 1, count + 1);
  }
};
```

0321 Create Maximum Number

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 321. Create Maximum Number
 * https://leetcode.com/problems/create-maximum-number/
 * Difficulty: Hard
 *
 * You are given two integer arrays nums1 and nums2 of lengths m and n respectively.
 * nums1 and nums2 represent the digits of two numbers. You are also given an integer k.
 *
 * Create the maximum number of length k <= m + n from digits of the two numbers. The
 * relative order of the digits from the same array must be preserved.
 *
 * Return an array of the k digits representing the answer.
 */

  for (let i = 0, l = m, r = nums.length - 1, t = [...nums]; i < nums.length; i++) {
    nums[i] = i % 2 ? t[r--] : t[l--];
  }
};
```

0325 Maximum Size Subarray Sum Equals K

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 325. Maximum Size Subarray Sum Equals k
 * https://leetcode.com/problems/maximum-size-subarray-sum-equals-k/
 * Difficulty: Medium
 *
 * Given an integer array nums and an integer k, return the maximum length of a subarray that
 * sums to k. If there is not one, return 0 instead.
 */
```

```
/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var maxSubArrayLen = function(nums, k) {
  const sumIndex = new Map([[0, -1]]);
  let currentSum = 0;
  let result = 0;

  for (let i = 0; i < nums.length; i++) {
    currentSum += nums[i];
    if (sumIndex.has(currentSum - k)) {
      result = Math.max(result, i - sumIndex.get(currentSum - k));
    }
    if (!sumIndex.has(currentSum)) {
      sumIndex.set(currentSum, i);
    }
  }

  return result;
};
```

0326 Power Of Three

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 326. Power of Three
 * https://leetcode.com/problems/power-of-three/
 * Difficulty: Easy
 *
 * Given an integer n, return true if it is a power of three. Otherwise, return false.
 *
 * An integer n is a power of three, if there exists an integer x such that n == 3x.
 */

/**
 * @param {number} n
 * @return {boolean}
 */

    odd.next = odd.next.next;
    odd = odd.next;
    pointer.next = odd.next;
  }

  odd.next = even;
  return head;
};
```

0329 Longest Increasing Path In A Matrix

HARD

APPROACH NOTES

Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 329. Longest Increasing Path in a Matrix
 * https://leetcode.com/problems/longest-increasing-path-in-a-matrix/
 * Difficulty: Hard
 *
 * Given an m x n integers matrix, return the length of the longest increasing path in matrix.
 *
 * From each cell, you can either move in four directions: left, right, up, or down. You may
 * not move diagonally or move outside the boundary (i.e., wrap-around is not allowed).
 */

/**
 * @param {number[][]} matrix
 * @return {number}
 */
var longestIncreasingPath = function(matrix) {
  if (!matrix.length) return 0;
  const m = matrix.length;
  const n = matrix[0].length;
  const cache = new Array(m).fill().map(() => new Array(n));
  const directions = [[0, 1], [1, 0], [0, -1], [-1, 0]];

  return Math.max(...new Array(m).fill().map((_, i) =>
    new Array(n).fill().map((_, j) => dfs(i, j))).flat());

  function dfs(i, j) {
    return cache[i][j] || (cache[i][j] = 1 + Math.max(...directions.map(([di, dj]) => {
      const [a, b] = [i + di, j + dj];
      return a >= 0 && a < m && b >= 0 && b < n && matrix[a][b] > matrix[i][j]
        ? dfs(a, b) : 0;
    })));
  }
};
```

0330 Patching Array

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 330. Patching Array
 * https://leetcode.com/problems/patching-array/
 * Difficulty: Hard
 *
 * Given a sorted integer array nums and an integer n, add/patch elements to the array such
 * that any number in the range [1, n] inclusive can be formed by the sum of some elements
 * in the array.
 *
 * Return the minimum number of patches required.
 */

/**
 * @param {number[]} nums
 * @param {number} n
 * @return {number}
 */
var minPatches = function(nums, n) {
  let result = 0;

  for (let i = 0, k = 1; k <= n;) {

      k += nums[i++];
    } else {
      k += k;
      result++;
    }
  }

  return result;
};
```

0331 Verify Preorder Serialization Of A Binary Tree

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 331. Verify Preorder Serialization of a Binary Tree
 * https://leetcode.com/problems/verify-preorder-serialization-of-a-binary-tree/
 * Difficulty: Medium
 *
 * One way to serialize a binary tree is to use preorder traversal. When we encounter a
non-null
 * node, we record the node's value. If it is a null node, we record using a sentinel value
such
 * as '#'.
 *
 * For example, the above binary tree can be serialized to the string
"9,3,4,#,#,1,#,#,2,#,6,#,#",
 * where '#' represents a null node.
 *
 * Given a string of comma-separated values preorder, return true if it is a correct preorder
 * traversal serialization of a binary tree.
 *
 * It is guaranteed that each comma-separated value in the string must be either an integer or
 * a character '#' representing null pointer.
 *
 * You may assume that the input format is always valid.
 * For example, it could never contain two consecutive commas, such as "1,,3".
 * Note: You are not allowed to reconstruct the tree.
 */
```

```
/**
 * @param {string} preorder
 * @return {boolean}
 */
var isValidSerialization = function(preorder) {
  let result = 1;
  for (const node of preorder.split(',')) {
    if (result) {
      result += node === '#' ? -1 : 1;
    } else {
      return false;
    }
  }
  return result < 1;
};
```

0332 Reconstruct Itinerary

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 332. Reconstruct Itinerary
 * https://leetcode.com/problems/reconstruct-itinerary/
 * Difficulty: Hard
 *
 * You are given a list of airline tickets where tickets[i] = [fromi, toi] represent the
departure
 * and the arrival airports of one flight. Reconstruct the itinerary in order and return it.
 *
 * All of the tickets belong to a man who departs from "JFK", thus, the itinerary must begin
with
 * "JFK". If there are multiple valid itineraries, you should return the itinerary that has
the
 * smallest lexical order when read as a single string.
 *
 * For example, the itinerary ["JFK", "LGA"] has a smaller lexical order than ["JFK", "LGB"].
 *
 * You may assume all tickets form at least one valid itinerary. You must use all the tickets
once
 * and only once.
 */

/**
 * @param {string[][]} tickets
 * @return {string[]}
 */
var findItinerary = function(tickets) {
  const graph = new Map();
  const itinerary = [];

  for (const [from, to] of tickets) {
    if (!graph.has(from)) {

```

0339 Nested List Weight Sum

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 339. Nested List Weight Sum
 * https://leetcode.com/problems/nested-list-weight-sum/
 * Difficulty: Medium
 *
 * You are given a nested list of integers nestedList. Each element is either an integer or
 * a list whose elements may also be integers or other lists.
 *
 * The depth of an integer is the number of lists that it is inside of. For example, the
nested
 * list [1,[2,2],[[3],2],1] has each integer's value set to its depth.
 *
 * Return the sum of each integer in nestedList multiplied by its depth.
 */

/**
 * @param {NestedInteger[]} nestedList
 * @return {number}
 */
var depthSum = function(nestedList) {
  return calculateDepth(nestedList, 1);

  function calculateDepth(list, depth) {
    let total = 0;
    for (const element of list) {
      if (element.isInteger()) {
        total += element.getInteger() * depth;
      } else {
        total += calculateDepth(element.getList(), depth + 1);
      }
    }
    return total;
  }
};
```

0340 Longest Substring With At Most K Distinct Characters

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 340. Longest Substring with At Most K Distinct Characters
 * https://leetcode.com/problems/longest-substring-with-at-most-k-distinct-characters/
 * Difficulty: Medium
 *
 * Given a string s and an integer k, return the length of the longest substring of s that
 * contains at most k distinct characters.
 */

/**
 * @param {string} s
 * @param {number} k
 * @return {number}
 */
var lengthOfLongestSubstringKDistinct = function(s, k) {
  const map = new Map();
  let result = 0;
  let left = 0;
```

```
  for (let right = 0; right < s.length; right++) {
    map.set(s[right], (map.get(s[right]) || 0) + 1);

    while (map.size > k) {
      map.set(s[left], map.get(s[left]) - 1);
      if (map.get(s[left]) === 0) {
        map.delete(s[left]);
      }
      left++;
    }

    result = Math.max(result, right - left + 1);
  }

  return result;
};
```

0341 Flatten Nested List Iterator

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 341. Flatten Nested List Iterator
 * https://leetcode.com/problems/flatten-nested-list-iterator/
 * Difficulty: Medium
 *
 * You are given a nested list of integers nestedList. Each element is either an integer or a
list
 * whose elements may also be integers or other lists. Implement an iterator to flatten it.
 *
 * Implement the NestedIterator class:
 * - NestedIterator(List<NestedInteger> nestedList) Initializes the iterator with the nested
list
 *   nestedList.
 * - int next() Returns the next integer in the nested list.
 * - boolean hasNext() Returns true if there are still some integers in the nested list and
false
 *   otherwise.
 *
 * Your code will be tested with the following pseudocode:
 * initialize iterator with nestedList
 * res = []
 * while iterator.hasNext()
 *   append iterator.next() to the end of res
 * return res
 *
 * If res matches the expected flattened list, then your code will be judged as correct.
 */

/**
 * @constructor
 * @param {NestedInteger[]} nestedList
 */
var NestedIterator = function(nestedList) {
  this.stack = [];
  this.flatten(nestedList);
};

/**
 * @this NestedIterator

 * @returns {void}
 */
NestedIterator.prototype.flatten = function(list) {
  for (let i = list.length - 1; i >= 0; i--) {
    this.stack.push(list[i]);
  }
};
```

```
/**
 * @this NestedIterator
 * @returns {boolean}
 */
NestedIterator.prototype.hasNext = function() {
  while (this.stack.length > 0 && !this.stack[this.stack.length - 1].isInteger()) {
    const nested = this.stack.pop().getList();
    this.flatten(nested);
  }
  return this.stack.length > 0;
};

/**
 * @this NestedIterator
 * @returns {integer}
 */
NestedIterator.prototype.next = function() {
  return this.stack.pop().getInteger();
};
```

0342 Power Of Four

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 342. Power of Four
 * https://leetcode.com/problems/power-of-four/
 * Difficulty: Easy
 *
 * Given an integer n, return true if it is a power of four. Otherwise, return false.
 *
 * An integer n is a power of four, if there exists an integer x such that n == 4x.
 */

/**
 * @param {number} n
 * @return {boolean}
 */
var isPowerOfFour = function(n) {
  if (n > 1) {
    while (n % 4 === 0) {
      n /= 4
    }
  }
  return n === 1;
};
```

0343 Integer Break

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 343. Integer Break
 * https://leetcode.com/problems/integer-break/
 * Difficulty: Medium
 *
 * Given an integer n, break it into the sum of k positive integers, where k >= 2,
 * and maximize the product of those integers.
 *
 * Return the maximum product you can get.
 */

/**
 * @param {number} n
 * @return {number}
```

```
 */
var integerBreak = function(n) {
  if (n <= 3) return n - 1;
  let product = 1;
  while (n > 4) {
    product *= 3;
    n -= 3;
  }
  return product * n;
};
```

0344 Reverse String

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 344. Reverse String
 * https://leetcode.com/problems/reverse-string/
 * Difficulty: Easy
 *
 * Write a function that reverses a string. The input string is given as an array
 * of characters s.
 *
 * You must do this by modifying the input array in-place with O(1) extra memory.
 */

/**
 * @param {character[]} s
 * @return {void} Do not return anything, modify s in-place instead.
 */
var reverseString = function(s) {
  for (let i = 0; i < Math.floor(s.length / 2); i++) {
    [s[s.length - 1 - i], s[i]] = [s[i], s[s.length - 1 - i]];
  }
};
```

0345 Reverse Vowels Of A String

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 345. Reverse Vowels of a String
 * https://leetcode.com/problems/reverse-vowels-of-a-string/
 * Difficulty: Easy
 *
 * Write a function that takes a string as input
 * and reverse only the vowels of a string.
 */

/**
 * @param {string} s
 * @return {string}
 */
var reverseVowels = function(s) {
  const vowels = s.match(/[aeiou]/ig);
  return s.replace(/[aeiou]/ig, () => vowels.pop());
};
```

0346 Moving Average From Data Stream

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 346. Moving Average from Data Stream
 * https://leetcode.com/problems/moving-average-from-data-stream/
 * Difficulty: Easy
 *
 * Given a stream of integers and a window size, calculate the moving average of all integers
 * in the sliding window.
 *
 * Implement the MovingAverage class:
 * - MovingAverage(int size) Initializes the object with the size of the window size.
 * - double next(int val) Returns the moving average of the last size values of the stream.
 */

/**
 * @param {number} size
 */
var MovingAverage = function(size) {
  this.window = [];
  this.maxSize = size;
  this.sum = 0;
};

/**
 * @param {number} val
 * @return {number}
 */
MovingAverage.prototype.next = function(val) {
  this.window.push(val);
  this.sum += val;

  if (this.window.length > this.maxSize) {
    this.sum -= this.window.shift();
  }

  return this.sum / this.window.length;
};
```

0347 Top K Frequent Elements

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 347. Top K Frequent Elements
 * https://leetcode.com/problems/top-k-frequent-elements/
 * Difficulty: Medium
 *
 * Given an integer array `nums` and an integer `k`, return the `k` most
 * frequent elements. You may return the answer in any order.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number[]}
 */
var topKFrequent = function(nums, k) {
  const map = new Map();

  nums.forEach(value => map.set(value, (map.get(value) || 0) + 1));

  return [...map]
    .sort((a, b) => b[1] - a[1])
    .slice(0, k)
    .map(([value]) => value)
};
```

0348 Design Tic Tac Toe

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 348. Design Tic-Tac-Toe
 * https://leetcode.com/problems/design-tic-tac-toe/
 * Difficulty: Medium
 *
 * Assume the following rules are for the tic-tac-toe game on an n x n board between two
players:
 * 1. A move is guaranteed to be valid and is placed on an empty block.
 * 2. Once a winning condition is reached, no more moves are allowed.
 * 3. A player who succeeds in placing n of their marks in a horizontal, vertical, or diagonal
 *    row wins the game.
 *
 * Implement the TicTacToe class:
 * - TicTacToe(int n) Initializes the object the size of the board n.
 * - int move(int row, int col, int player) Indicates that the player with id player plays at
the
 *   cell (row, col) of the board. The move is guaranteed to be a valid move, and the two
players
 *   alternate in making moves. Return
 *   - 0 if there is no winner after the move,
 *   - 1 if player 1 is the winner after the move, or
 *   - 2 if player 2 is the winner after the move.
 */

/**
 * @param {number} n
 */
var TicTacToe = function(n) {
  this.size = n;
  this.rows = new Array(n).fill(0);
  this.cols = new Array(n).fill(0);
  this.diagonal = 0;
  this.antiDiagonal = 0;
};

/**
 * @param {number} row
 * @param {number} col
 * @param {number} player
 * @return {number}
 */
TicTacToe.prototype.move = function(row, col, player) {
  const value = player === 1 ? 1 : -1;

  this.rows[row] += value;
  this.cols[col] += value;

  if (row === col) {
    this.diagonal += value;
  }

  if (row + col === this.size - 1) {
    this.antiDiagonal += value;
  }

  if (Math.abs(this.rows[row]) === this.size || Math.abs(this.cols[col]) === this.size
    || Math.abs(this.diagonal) === this.size || Math.abs(this.antiDiagonal) === this.size) {
    return player;
  }

  return 0;
};
```

0349 Intersection Of Two Arrays

EASY

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 349. Intersection of Two Arrays
 * https://leetcode.com/problems/intersection-of-two-arrays/
 * Difficulty: Easy
 *
 * Given two integer arrays `nums1` and `nums2`, return an array of their intersection.
 *
 * Each element in the result must be unique and you may return the result in any order.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number[]}
 */
var intersection = function(nums1, nums2) {
  const set = new Set(nums1);
  return nums2.filter(value => set.delete(value));
};
```

0350 Intersection Of Two Arrays Ii

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 350. Intersection of Two Arrays II
 * https://leetcode.com/problems/intersection-of-two-arrays-ii/
 * Difficulty: Easy
 *
 * Given two integer arrays nums1 and nums2, return an array of their intersection.
 *
 * Each element in the result must appear as many times as it shows in both arrays
 * and you may return the result in any order.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number[]}
 */
var intersect = function(nums1, nums2) {
  const result = [];
  const map = {};

  nums1.forEach(value => map[value] = (map[value] || 0) + 1);
  nums2.forEach(value => {
    if (map[value]) {
      result.push(value);
      map[value]--;
    }
  });

  return result;
};
```

0351 Android Unlock Patterns

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 351. Android Unlock Patterns
 * https://leetcode.com/problems/android-unlock-patterns/
 * Difficulty: Medium
 *
 * Android devices have a special lock screen with a 3 x 3 grid of dots. Users can set an
 * "unlock pattern" by connecting the dots in a specific sequence, forming a series of joined
 * line segments where each segment's endpoints are two consecutive dots in the sequence.
 * A sequence of k dots is a valid unlock pattern if both of the following are true:
 * - All the dots in the sequence are distinct.
 * - If the line segment connecting two consecutive dots in the sequence passes through the
 *   center of any other dot, the other dot must have previously appeared in the sequence.
 *   No jumps through the center non-selected dots are allowed.
 *   - For example, connecting dots 2 and 9 without dots 5 or 6 appearing beforehand is valid
 *     because the line from dot 2 to dot 9 does not pass through the center of either dot 5
or 6.
 *   - However, connecting dots 1 and 3 without dot 2 appearing beforehand is invalid because
 *     the line from dot 1 to dot 3 passes through the center of dot 2.
 *
 * Here are some example valid and invalid unlock patterns:
 */

/**
 * @param {number} m
 * @param {number} n
 * @return {number}
 */
var numberOfPatterns = function(m, n) {
  const jumps = new Array(10).fill().map(() => new Array(10).fill(0));
  jumps[1][3] = jumps[3][1] = 2;
  jumps[1][7] = jumps[7][1] = 4;
  jumps[3][9] = jumps[9][3] = 6;
  jumps[7][9] = jumps[9][7] = 8;
  jumps[1][9] = jumps[9][1] = jumps[2][8] = jumps[8][2] = jumps[3][7]
    = jumps[7][3] = jumps[4][6] = jumps[6][4] = 5;

  function backtrack(current, visited, length) {
    if (length > n) return 0;
    let count = length >= m ? 1 : 0;
    if (length === n) return count;

    for (let next = 1; next <= 9; next++) {
      if (!visited.has(next)) {
        const jump = jumps[current][next];
        if (jump === 0 || visited.has(jump)) {
          visited.add(next);
          count += backtrack(next, visited, length + 1);
          visited.delete(next);
        }
      }
    }
    return count;
  }

  let total = 0;
  const visited = new Set();
  visited.add(1);
  total += backtrack(1, visited, 1) * 4;
  visited.delete(1);

  visited.add(2);
  total += backtrack(2, visited, 1) * 4;
  visited.delete(2);

  visited.add(5);
  total += backtrack(5, visited, 1);
```

```
  return total;
};
```

0352 Data Stream As Disjoint Intervals

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 352. Data Stream as Disjoint Intervals
 * https://leetcode.com/problems/data-stream-as-disjoint-intervals/
 * Difficulty: Hard
 *
 * Given a data stream input of non-negative integers a1, a2, ..., an, summarize the
 * numbers seen so far as a list of disjoint intervals.
 *
 * Implement the SummaryRanges class:
 * - SummaryRanges() Initializes the object with an empty stream.
 * - void addNum(int value) Adds the integer value to the stream.
 * - int[][] getIntervals() Returns a summary of the integers in the stream currently as
 *   a list of disjoint intervals [starti, endi]. The answer should be sorted by starti.
 */

var SummaryRanges = function() {
  this.list = [];
};

/**
 * @param {number} value
 * @return {void}
 */
SummaryRanges.prototype.addNum = function(value) {
  this.list[value] = true;
};

/**
 * @return {number[][]}
 */
SummaryRanges.prototype.getIntervals = function() {
  const result = [];

  for (let i = 0; i < this.list.length; i++) {
    if (this.list[i]) {
      let j = i;
      while (this.list[j]) {
        j++;
      }
      result.push([i, j - 1]);
      i = j;
    }
  }

  return result;
};
```

0353 Design Snake Game

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 353. Design Snake Game
 * https://leetcode.com/problems/design-snake-game/
 * Difficulty: Medium
 *
 * Design a Snake game that is played on a device with screen size height x width. Play the
```

```
 * game online if you are not familiar with the game.
 *
 * The snake is initially positioned at the top left corner (0, 0) with a length of 1 unit.
 *
 * You are given an array food where food[i] = (ri, ci) is the row and column position of a
 * piece of food that the snake can eat. When a snake eats a piece of food, its length and
 * the game's score both increase by 1.
 *
 * Each piece of food appears one by one on the screen, meaning the second piece of food will
 * not appear until the snake eats the first piece of food.
 *
 * When a piece of food appears on the screen, it is guaranteed that it will not appear on a
 * block occupied by the snake.
 *
 * The game is over if the snake goes out of bounds (hits a wall) or if its head occupies a
 * space that its body occupies after moving (i.e. a snake of length 4 cannot run into
itself).
 *
 * Implement the SnakeGame class:
 * - SnakeGame(int width, int height, int[][] food) Initializes the object with a screen of
size
 *   height x width and the positions of the food.
 * - int move(String direction) Returns the score of the game after applying one direction
move
 *   by the snake. If the game is over, return -1.
 */

/**
 * @param {number} width
 * @param {number} height
 * @param {number[][]} food
 */
var SnakeGame = function(width, height, food) {
  this.width = width;
  this.height = height;
  this.food = food;
  this.foodIndex = 0;
  this.score = 0;
  this.snake = [[0, 0]];
  this.bodySet = new Set(['0,0']);
};

/**
 * @param {string} direction
 * @return {number}
 */
SnakeGame.prototype.move = function(direction) {
  const head = [...this.snake[0]];

  if (direction === 'U') head[0]--;
  else if (direction === 'D') head[0]++;
  else if (direction === 'L') head[1]--;
  else if (direction === 'R') head[1]++;

  if (head[0] < 0 || head[0] >= this.height || head[1] < 0 || head[1] >= this.width) {
    return -1;
  }

  const tail = this.snake.pop();
  this.bodySet.delete(`${tail[0]},${tail[1]}`);

  const headKey = `${head[0]},${head[1]}`;
  if (this.bodySet.has(headKey)) {
    return -1;
  }

  this.snake.unshift(head);
  this.bodySet.add(headKey);

  if (this.foodIndex < this.food.length && head[0] === this.food[this.foodIndex][0]
      && head[1] === this.food[this.foodIndex][1]) {
    this.snake.push(tail);
    this.bodySet.add(`${tail[0]},${tail[1]}`);
    this.foodIndex++;
    this.score++;
```

```
  }

  return this.score;
};
```

0354 Russian Doll Envelopes

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 354. Russian Doll Envelopes
 * https://leetcode.com/problems/russian-doll-envelopes/
 * Difficulty: Hard
 *
 * You are given a 2D array of integers envelopes where envelopes[i] = [wi, hi] represents
 * the width and the height of an envelope.
 *
 * One envelope can fit into another if and only if both the width and height of one envelope
 * are greater than the other envelope's width and height.
 *
 * Return the maximum number of envelopes you can Russian doll (i.e., put one inside the
other).
 *
 * Note: You cannot rotate an envelope.
 */

/**
 * @param {number[][]} envelopes
 * @return {number}
 */
var maxEnvelopes = function(envelopes) {
  const result = [];

  envelopes.sort((a, b) => a[0] === b[0] ? b[1] - a[1] : a[0] - b[0]);
  envelopes.forEach(([_, h]) => {
    let left = 0;

    } else {
      result[left] = h;
    }
  });

  return result.length;
};
```

0355 Design Twitter

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 355. Design Twitter
 * https://leetcode.com/problems/design-twitter/
 * Difficulty: Medium
 *
 * Design a simplified version of Twitter where users can post tweets, follow/unfollow another
```

```
 user,
 * and is able to see the 10 most recent tweets in the user's news feed.
 *
 * Implement the Twitter class:
 * - Twitter() Initializes your twitter object.
 * - void postTweet(int userId, int tweetId) Composes a new tweet with ID tweetId by the user
 *   userId. Each call to this function will be made with a unique tweetId.
 * - List<Integer> getNewsFeed(int userId) Retrieves the 10 most recent tweet IDs in the
user's news
 *   feed. Each item in the news feed must be posted by users who the user followed or by the
user
 *   themself. Tweets must be ordered from most recent to least recent.
 * - void follow(int followerId, int followeeId) The user with ID followerId started following
 the
 *   user with ID followeeId.
 * - void unfollow(int followerId, int followeeId) The user with ID followerId started
unfollowing
 *   the user with ID followeeId.
 */

var Twitter = function() {

      while (index < s.length && result[index] !== '') {
        index++;
      }
      if (index >= s.length) index = 0;
      result[index] = char;
      index++;
      if (count > 1) temp.push([count - 1, char]);
    }

    temp.sort((a, b) => b[0] - a[0]);
    maxHeap.push(...temp);
    maxHeap.sort((a, b) => b[0] - a[0]);
  }

  for (let i = 0; i <= s.length - k; i++) {
    const seen = new Set();
    for (let j = i; j < i + k; j++) {
      if (seen.has(result[j])) return '';
```

```
      seen.add(result[j]);
    }
  }

  return result.join('');
};
```

0359 Logger Rate Limiter

EASY

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 359. Logger Rate Limiter
 * https://leetcode.com/problems/logger-rate-limiter/
 * Difficulty: Easy
 *
 * Design a logger system that receives a stream of messages along with their timestamps.
 * Each unique message should only be printed at most every 10 seconds (i.e. a message
 * printed at timestamp t will prevent other identical messages from being printed until
 * timestamp t + 10).
 *
 * All messages will come in chronological order. Several messages may arrive at the same
timestamp.
 *
 * Implement the Logger class:
 * - Logger() Initializes the logger object.
 * - bool shouldPrintMessage(int timestamp, string message) Returns true if the message should
 *   be printed in the given timestamp, otherwise returns false.
 */

var Logger = function() {
  this.messageTimestamps = new Map();
};

/**
 * @param {number} timestamp
 * @param {string} message
 * @return {boolean}
 */
Logger.prototype.shouldPrintMessage = function(timestamp, message) {
  const nextAllowed = this.messageTimestamps.get(message) || 0;
  if (timestamp >= nextAllowed) {
    this.messageTimestamps.set(message, timestamp + 10);
    return true;
  }
  return false;
};
```

0360 Sort Transformed Array

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 360. Sort Transformed Array
 * https://leetcode.com/problems/sort-transformed-array/
 * Difficulty: Medium
 *
 * Given a sorted integer array nums and three integers a, b and c, apply a quadratic function
 * of the form f(x) = ax2 + bx + c to each element nums[i] in the array, and return the array
 * in a sorted order.
 */

/**

  }

  return result;
};
```

0362 Design Hit Counter

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 362. Design Hit Counter
 * https://leetcode.com/problems/design-hit-counter/
 * Difficulty: Medium
 *
 * Design a hit counter which counts the number of hits received in the past 5 minutes
 * (i.e., the past 300 seconds).
 *
 * Your system should accept a timestamp parameter (in seconds granularity), and you may
 * assume that calls are being made to the system in chronological order (i.e., timestamp
 * is monotonically increasing). Several hits may arrive roughly at the same time.
 *
 * Implement the HitCounter class:
 * - HitCounter() Initializes the object of the hit counter system.
 * - void hit(int timestamp) Records a hit that happened at timestamp (in seconds). Several
 *   hits may happen at the same timestamp.
 * - int getHits(int timestamp) Returns the number of hits in the past 5 minutes from
timestamp
 *   (i.e., the past 300 seconds).
 */

var HitCounter = function() {
  this.hits = [];
};

0376 Wiggle Subsequence

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 376. Wiggle Subsequence
 * https://leetcode.com/problems/wiggle-subsequence/
 * Difficulty: Medium
 *
 * A wiggle sequence is a sequence where the differences between successive numbers strictly
 * alternate between positive and negative. The first difference (if one exists) may be either
 * positive or negative. A sequence with one element and a sequence with two non-equal
elements
 * are trivially wiggle sequences.
 * - For example, [1, 7, 4, 9, 2, 5] is a wiggle sequence because the differences (6, -3, 5,
-7, 3)
 *   alternate between positive and negative.
 * - In contrast, [1, 4, 7, 2, 5] and [1, 7, 4, 5, 5] are not wiggle sequences. The first is
not
 *   because its first two differences are positive, and the second is not because its last
 *   difference is zero.
 *
 * A subsequence is obtained by deleting some elements (possibly zero) from the original
sequence,
 * leaving the remaining elements in their original order.
 *
 * Given an integer array nums, return the length of the longest wiggle subsequence of nums.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */

 * https://leetcode.com/problems/kth-smallest-element-in-a-sorted-matrix/
 * Difficulty: Medium
 *
 * Given an n x n matrix where each of the rows and columns is sorted in ascending order,
 * return the kth smallest element in the matrix.
 *
 * Note that it is the kth smallest element in the sorted order, not the kth distinct element.
 *
 * You must find a solution with a memory complexity better than O(n2).
 */

/**
 * @param {number[][]} matrix
 * @param {number} k
 * @return {number}
 */
var kthSmallest = function(matrix, k) {
  return matrix.flat().sort((a, b) => a - b)[k - 1];
};
```

0379 Design Phone Directory

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 379. Design Phone Directory
 * https://leetcode.com/problems/design-phone-directory/
 * Difficulty: Medium
 *
 * Design a phone directory that initially has maxNumbers empty slots that can store numbers.
 * The directory should store numbers, check if a certain slot is empty or not, and empty a
 * given slot.
 *
 * Implement the PhoneDirectory class:
 * - PhoneDirectory(int maxNumbers) Initializes the phone directory with the number of
 *   available slots maxNumbers.
 * - int get() Provides a number that is not assigned to anyone. Returns -1 if no number
 *   is available.
 * - bool check(int number) Returns true if the slot number is available and false otherwise.
 * - void release(int number) Recycles or releases the slot number.
 */

/**
 * @param {number} maxNumbers
 */
var PhoneDirectory = function(maxNumbers) {
  this.available = new Set();
  this.released = [];
  this.max = maxNumbers;
  for (let i = 0; i < maxNumbers; i++) {
    this.available.add(i);
  }
};

/**
 * @return {number}
 */
PhoneDirectory.prototype.get = function() {
  if (this.available.size === 0 && this.released.length === 0) return -1;
  let number;
  if (this.released.length > 0) {
    number = this.released.pop();
  } else {
    number = this.available.values().next().value;
    this.available.delete(number);
  }
  return number;
};

/**
 * @param {number} number
 * @return {boolean}
 */
PhoneDirectory.prototype.check = function(number) {
  return number >= 0 && number < this.max
    && (this.available.has(number) || this.released.includes(number));
};

/**
 * @param {number} number
 * @return {void}
 */
PhoneDirectory.prototype.release = function(number) {
  if (number >= 0 && number < this.max
      && !this.available.has(number) && !this.released.includes(number)) {
    this.released.push(number);
  }
};
```

0380 Insert Delete Getrandom O1

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 380. Insert Delete GetRandom O(1)
 * https://leetcode.com/problems/insert-delete-getrandom-o1/
 * Difficulty: Medium
 *
 * Implement the RandomizedSet class:
 * - RandomizedSet() Initializes the RandomizedSet object.
 * - bool insert(int val) Inserts an item val into the set if not present. Returns true if the
 *   item was not present, false otherwise.
 * - bool remove(int val) Removes an item val from the set if present. Returns true if the
item
 *   was present, false otherwise.
 * - int getRandom() Returns a random element from the current set of elements (it's
guaranteed
 *   that at least one element exists when this method is called). Each element must have the
 *   same probability of being returned.
 *
 * You must implement the functions of the class such that each function works in average O(1)
 * time complexity.
 */

var RandomizedSet = function() {
  this.set = new Set();
};

/**
 * @param {number} val
 * @return {boolean}
 */
RandomizedSet.prototype.insert = function(val) {
  const hasValue = this.set.has(val);
  this.set.add(val);
  return !hasValue;
};

/**
 * @param {number} val
 * @return {boolean}
 */
RandomizedSet.prototype.remove = function(val) {
  const hasValue = this.set.has(val);
  this.set.delete(val);
  return hasValue;
};

/**
 * @return {number}
 */
RandomizedSet.prototype.getRandom = function() {
  const item = Array.from(this.set);
  const randomIndex = Math.floor(Math.random() * item.length);
  return item[randomIndex];
};
```

0381 Insert Delete Getrandom O1 Duplicates Allowed

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 381. Insert Delete GetRandom O(1) - Duplicates allowed
 * https://leetcode.com/problems/insert-delete-getrandom-o1-duplicates-allowed/
 * Difficulty: Hard
 *
 * RandomizedCollection is a data structure that contains a collection of numbers, possibly
 * duplicates (i.e., a multiset). It should support inserting and removing specific elements
 * and also reporting a random element.
 *
 * Implement the RandomizedCollection class:
 * - RandomizedCollection() Initializes the empty RandomizedCollection object.
```

```
 * - bool insert(int val) Inserts an item val into the multiset, even if the item is already
 *   present. Returns true if the item is not present, false otherwise.
 * - bool remove(int val) Removes an item val from the multiset if present. Returns true if
 *   the item is present, false otherwise. Note that if val has multiple occurrences in the
 *   multiset, we only remove one of them.
 * - int getRandom() Returns a random element from the current multiset of elements. The
 *   probability of each element being returned is linearly related to the number of the same
 *   values the multiset contains.
 *
 * You must implement the functions of the class such that each function works on average O(1)
 * time complexity.
 *
 * Note: The test cases are generated such that getRandom will only be called if there is at
 * least one item in the RandomizedCollection.
 */

var RandomizedCollection = function() {
  this.values = [];
  this.map = new Map();
};

/**
 * @param {number} val
 * @return {boolean}
 */
RandomizedCollection.prototype.insert = function(val) {
  this.values.push(val);
  const values = this.map.get(val) || new Set();
  values.add(this.values.length - 1);
  this.map.set(val, values);
  return values.size === 1;
};

/**
 * @param {number} val
 * @return {boolean}
 */
RandomizedCollection.prototype.remove = function(val) {
  if (!this.map.has(val)) return false;
  const values = this.map.get(val);
  const index = values.values().next().value;
  values.delete(index);
  if (index < this.values.length - 1) {
    const last = this.values.pop();
    this.values[index] = last;
    const lastValues = this.map.get(last);
    lastValues.delete(this.values.length);
    lastValues.add(index);
  } else {
    this.values.pop();
  }
  if (!values.size) {
    this.map.delete(val);
  }
  return true;
};

/**
 * @return {number}
 */
RandomizedCollection.prototype.getRandom = function() {
  return this.values[Math.floor(Math.random() * this.values.length)];
};
```

0382 Linked List Random Node

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 382. Linked List Random Node
```

```
 * https://leetcode.com/problems/linked-list-random-node/
 * Difficulty: Medium
 *
 * Given a singly linked list, return a random node's value from the linked list. Each node
must
 * have the same probability of being chosen.
 *
 * Implement the Solution class:
 * - Solution(ListNode head) Initializes the object with the head of the singly-linked list
head.
 * - int getRandom() Chooses a node randomly from the list and returns its value. All the
nodes
 *   of the list should be equally likely to be chosen.
 */

/**
 * Definition for singly-linked list.
 * function ListNode(val, next) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.next = (next===undefined ? null : next)
 * }
 */
/**
 * @param {ListNode} head
 */
var Solution = function(head) {
  this.head = head;
};

/**
 * @return {number}
 */
Solution.prototype.getRandom = function() {
  let current = this.head;
  let result = current.val;
  let count = 1;

  while (current.next) {
    current = current.next;
    count++;
    if (Math.random() < 1 / count) {
      result = current.val;
    }
  }

  return result;
};
```

0383 Ransom Note

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 383. Ransom Note
 * https://leetcode.com/problems/ransom-note/
 * Difficulty: Easy
 *
 * Given two stings ransomNote and magazine, return true if ransomNote
 * can be constructed from magazine and false otherwise.
 *
 * Each letter in magazine can only be used once in ransomNote.
 */

/**
 * @param {string} ransomNote
 * @param {string} magazine
 * @return {boolean}
 */
var canConstruct = function(ransomNote, magazine) {
  const map = new Map();
```

```
  for (let i = magazine.length - 1; i > -1; i--) {
    map.set(magazine[i], (map.get(magazine[i]) || 0) + 1);
  }

  for (let i = ransomNote.length - 1; i > -1; i--) {
    if ((map.get(ransomNote[i]) || 0) < 1) {
      return false;
    }
    map.set(ransomNote[i], map.get(ransomNote[i]) - 1);
  }

  return true;
};
```

0384 Shuffle An Array

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 384. Shuffle an Array
 * https://leetcode.com/problems/shuffle-an-array/
 * Difficulty: Medium
 *
 * Given an integer array nums, design an algorithm to randomly shuffle the array.
 * All permutations of the array should be equally likely as a result of the shuffling.
 *
 * Implement the Solution class:
 * - Solution(int[] nums) Initializes the object with the integer array nums.
 * - int[] reset() Resets the array to its original configuration and returns it.
 * - int[] shuffle() Returns a random shuffling of the array.
 */

/**
 * @param {number[]} nums
 */
var Solution = function(nums) {
  this.original = [...nums];
  this.result = [...nums];
};

/**
 * @return {number[]}
 */
Solution.prototype.reset = function() {
  this.result = [...this.original];
  return this.result;
};

/**
 * @return {number[]}
 */
Solution.prototype.shuffle = function() {
  for (let i = this.result.length - 1; i > 0; i--) {
    const j = Math.floor(Math.random() * (i + 1));
    [this.result[i], this.result[j]] = [this.result[j], this.result[i]];
  }
  return this.result;
};
```

0385 Mini Parser

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 385. Mini Parser
 * https://leetcode.com/problems/mini-parser/
 * Difficulty: Medium
 *
 * Given a string s represents the serialization of a nested list, implement a parser to
deserialize
 * it and return the deserialized NestedInteger.
 *
 * Each element is either an integer or a list whose elements may also be integers or other
lists.
 */

/**
 * @param {string} s
 * @return {NestedInteger}
 */
var deserialize = function(s) {
  return traverse(JSON.parse(s));

  function traverse(str) {
    if (Number.isInteger(str)) {
      return new NestedInteger(str);
    }
    const value = new NestedInteger();
    for (const s of str) {
      value.add(traverse(s));
    }
    return value;
  };
};
```

0386 Lexicographical Numbers

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 386. Lexicographical Numbers
 * https://leetcode.com/problems/lexicographical-numbers/
 * Difficulty: Medium
 *
 * Given an integer n, return all the numbers in the range [1, n] sorted in lexicographical
order.
 *
 * You must write an algorithm that runs in O(n) time.
 */

/**
 * @param {number} n
 * @return {number[]}
 */
var lexicalOrder = function(n) {
  const result = [];
  let value = 1;

  for (let i = 0; i < n; i++) {
    result.push(value);
    if (value * 10 <= n) {
      value *= 10;
    } else {
      while (value % 10 === 9 || value >= n) {
        value = Math.floor(value / 10);
      }
      value++;
    }
  }

  return result;
};
```

0387 First Unique Character In A String

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 387. First Unique Character in a String
 * https://leetcode.com/problems/first-unique-character-in-a-string/
 * Difficulty: Easy
 *
 * Given a string, find the first non-repeating character in
 * it and return it's index. If it doesn't exist, return -1.
 */

/**
 * @param {string} s
 * @return {number}
 */
var firstUniqChar = function(s) {
  for (let i = 0; i < s.length; i++) {
    if (s.indexOf(s.charAt(i)) === s.lastIndexOf(s.charAt(i))) {
      return i;
    }
  }

  return -1;
};
```

0388 Longest Absolute File Path

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 388. Longest Absolute File Path
 * https://leetcode.com/problems/longest-absolute-file-path/
 * Difficulty: Medium
 *
 * Suppose we have a file system that stores both files and directories. An example of one
system
 * is represented in the following picture:
 *
 * Here, we have dir as the only directory in the root. dir contains two subdirectories,
subdir1
 * and subdir2. subdir1 contains a file file1.ext and subdirectory subsubdir1. subdir2
contains
 * a subdirectory subsubdir2, which contains a file file2.ext.
 * In text form, it looks like this (with ■ representing the tab character):
 *
 * dir
 * ■ subdir1
 * ■ ■ file1.ext
 * ■ ■ subsubdir1
 * ■ subdir2
 * ■ ■ subsubdir2
 * ■ ■ ■ file2.ext
 *
 * If we were to write this representation in code, it will look like this:
 *
"dir\n\tsubdir1\n\t\tfile1.ext\n\t\tsubsubdir1\n\tsubdir2\n\t\tsubsubdir2\n\t\t\tfile2.ext".
 * Note that the '\n' and '\t' are the new-line and tab characters.
 *
 * Every file and directory has a unique absolute path in the file system, which is the order
of
 * directories that must be opened to reach the file/directory itself, all concatenated by
'/'s.
 * Using the above example, the absolute path to file2.ext is
```

```
"dir/subdir2/subsubdir2/file2.ext".
 * Each directory name consists of letters, digits, and/or spaces. Each file name is of the
form
 * name.extension, where name and extension consist of letters, digits, and/or spaces.
 *
 * Given a string input representing the file system in the explained format, return the
length of
 * the longest absolute path to a file in the abstracted file system. If there is no file in
the
 * system, return 0.
 *
 * Note that the testcases are generated such that the file system is valid and no file or
directory
 * name has length 0.
 */

/**
 * @param {string} input
 * @return {number}
 */
var lengthLongestPath = function(input) {
  const stack = [0];
  let result = 0;

  for (const line of input.split('\n')) {
    const level = line.lastIndexOf('\t') + 1;
    while (stack.length > level + 1) stack.pop();
    stack.push(stack.at(-1) + line.length - level + 1);
    if (line.includes('.')) {
      result = Math.max(result, stack.at(-1) - 1);
    }
  }

  return result;
};
```

0389 Find The Difference

EASY

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 389. Find the Difference
 * https://leetcode.com/problems/find-the-difference/
 * Difficulty: Easy
 *
 * You are given two strings s and t.
 *
 * String t is generated by random shuffling string s and then add one more letter at
 * a random position.
 *
 * Return the letter that was added to t.
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {character}
 */
var findTheDifference = function(s, t) {
  const map = new Map();
  t.split('').forEach(c => map.set(c, (map.get(c) ?? 0) + 1));
  s.split('').forEach(c => map.set(c, map.get(c) - 1));
  return Array.from(map).find(([letter, count]) => count)[0];
};
```

0390 Elimination Game

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 390. Elimination Game
 * https://leetcode.com/problems/elimination-game/
 * Difficulty: Medium
 *
 * You have a list arr of all integers in the range [1, n] sorted in a strictly increasing
order.
 * Apply the following algorithm on arr:
 * - Starting from left to right, remove the first number and every other number afterward
until
 *   you reach the end of the list.
 * - Repeat the previous step again, but this time from right to left, remove the rightmost
number
 *   and every other number from the remaining numbers.
 * - Keep repeating the steps again, alternating left to right and right to left, until a
single
 *   number remains.
 *
 * Given the integer n, return the last number that remains in arr.
 */

/**
 * @param {number} n
 * @return {number}
 */
var lastRemaining = function(n) {
  let result = 1;

  for (let isRemaining = true, count = n, step = 1; count > 1;) {
    if (isRemaining || count % 2 === 1) {
      result += step;
    }
    count = Math.floor(count / 2);
    isRemaining = !isRemaining;
    step *= 2;
  }

  return result;
};
```

0391 Perfect Rectangle

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 391. Perfect Rectangle
 * https://leetcode.com/problems/perfect-rectangle/
 * Difficulty: Hard
 *
 * Given an array rectangles where rectangles[i] = [xi, yi, ai, bi] represents an axis-aligned
 * rectangle. The bottom-left point of the rectangle is (xi, yi) and the top-right point of it
 * is (ai, bi).
 *
 * Return true if all the rectangles together form an exact cover of a rectangular region.
 */

/**
 * @param {number[][]} rectangles
 * @return {boolean}
 */
var isRectangleCover = function(rectangles) {
```

```
  const result = new Set();
  let area = 0;
  let minX = Infinity;
  let maxX = -Infinity;
  let minY = Infinity;
  let maxY = -Infinity;

  for (const [x1, y1, x2, y2] of rectangles) {
    area += (x2 - x1) * (y2 - y1);
    minX = Math.min(minX, x1);
    minY = Math.min(minY, y1);
    maxX = Math.max(maxX, x2);
    maxY = Math.max(maxY, y2);
    for (const corner of [`${x1},${y1}`, `${x2},${y1}`, `${x1},${y2}`, `${x2},${y2}`]) {
      result.has(corner) ? result.delete(corner) : result.add(corner);
    }
  }

  return area === (maxX - minX) * (maxY - minY) && result.size === 4
    && result.has(`${minX},${minY}`) && result.has(`${maxX},${minY}`)
    && result.has(`${minX},${maxY}`) && result.has(`${maxX},${maxY}`);
};
```

0392 Is Subsequence

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 392. Is Subsequence
 * https://leetcode.com/problems/is-subsequence/
 * Difficulty: Easy
 *
 * Given two strings s and t, return true if s is a subsequence of t, or false otherwise.
 *
 * A subsequence of a string is a new string that is formed from the original string by
 * deleting some (can be none) of the characters without disturbing the relative positions
 * of the remaining characters. (i.e., "ace" is a subsequence of "abcde" while "aec" is not).
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {boolean}
 */
var isSubsequence = function(s, t) {
  if (s.length > t.length) return false;
  let count = 0;
  for (let i = 0; i < t.length; i++) {
    if (s[count] === t[i]) {
      count++;
    }
  }
  return count === s.length;
};
```

0393 Utf 8 Validation

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 393. UTF-8 Validation
 * https://leetcode.com/problems/utf-8-validation/
 * Difficulty: Medium
 *
 * Given an integer array data representing the data, return whether it is a valid UTF-8
```

```
encoding
 * (i.e. it translates to a sequence of valid UTF-8 encoded characters).
 *
 * A character in UTF8 can be from 1 to 4 bytes long, subjected to the following rules:
 * 1. For a 1-byte character, the first bit is a 0, followed by its Unicode code.
 * 2. For an n-bytes character, the first n bits are all one's, the n + 1 bit is 0, followed
by
 *   n - 1 bytes with the most significant 2 bits being 10.
 *
 * This is how the UTF-8 encoding would work:
 *      Number of Bytes   |        UTF-8 Octet Sequence
 *                        |              (binary)
 *    --------------------+---------------------------------------
 *             1          |   0xxxxxxx
 *             2          |   110xxxxx 10xxxxxx
 *             3          |   1110xxxx 10xxxxxx 10xxxxxx
 *             4          |   11110xxx 10xxxxxx 10xxxxxx 10xxxxxx
 *
 * x denotes a bit in the binary form of a byte that may be either 0 or 1.
 *
 * Note: The input is an array of integers. Only the least significant 8 bits of each integer
is
 * used to store the data. This means each integer represents only 1 byte of data.
 */

/**
 * @param {number[]} data
 * @return {boolean}
 */
var validUtf8 = function(data) {
  let result = 0;

  for (const n of data) {
    if (result === 0) {
      if (n >> 7 === 0) result = 0;
      else if (n >> 5 === 0b110) result = 1;
      else if (n >> 4 === 0b1110) result = 2;
      else if (n >> 3 === 0b11110) result = 3;
      else return false;
    } else {
      if (n >> 6 !== 0b10) return false;
      result--;
    }
  }

  return result === 0;
};
```

0394 Decode String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 394. Decode String
 * https://leetcode.com/problems/decode-string/
 * Difficulty: Medium
 *
 * Given an encoded string, return its decoded string.
 *
 * The encoding rule is: k[encoded_string], where the encoded_string inside the square
 * brackets is being repeated exactly k times. Note that k is guaranteed to be a
 * positive integer.
 *
 * You may assume that the input string is always valid; there are no extra white spaces,
 * square brackets are well-formed, etc. Furthermore, you may assume that the original
 * data does not contain any digits and that digits are only for those repeat numbers, k.
 * For example, there will not be input like 3a or 2[4].
 *
 * The test cases are generated so that the length of the output will never exceed 105.
 */
```

```
/**
 * @param {string} s
 * @return {string}
 */
var decodeString = function(s) {
  const stack = [];
  let result = '';
  let decoder = 0;

  for (const c of s) {
    if (!isNaN(c) && Number(c) >= 0 && Number(c) <= 9) {
      decoder = Number(c) + decoder * 10;
    } else if (c === '[') {
      stack.push([result, decoder]);
      result = '';
      decoder = 0;
    } else if (c === ']') {
      const [previous, count] = stack.pop();
      result = previous + result.repeat(count);
    } else {
      result += c;
    }
  }

  return result;
};
```

0395 Longest Substring With At Least K Repeating Characters

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 395. Longest Substring with At Least K Repeating Characters
 * https://leetcode.com/problems/longest-substring-with-at-least-k-repeating-characters/
 * Difficulty: Medium
 *
 * Given a string s and an integer k, return the length of the longest substring of s such
 * that the frequency of each character in this substring is greater than or equal to k.
 *
 * If no such substring exists, return 0.
 */

/**
 * @param {string} s
 * @param {number} k
 * @return {number}
 */
var longestSubstring = function(s, k) {
  for (const char of Array.from(new Set(s))) {
    if (s.match(new RegExp(char, 'g')).length < k) {
      return Math.max(...s.split(char).map(str => longestSubstring(str, k)));
    }
  }
  return s.length;
};
```

0396 Rotate Function

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 396. Rotate Function
 * https://leetcode.com/problems/rotate-function/
 * Difficulty: Medium
```

```
 *
 * You are given an integer array nums of length n.
 *
 * Assume arrk to be an array obtained by rotating nums by k positions clock-wise.
 * We define the rotation function F on nums as follow:
 * - F(k) = 0 * arrk[0] + 1 * arrk[1] + ... + (n - 1) * arrk[n - 1].
 *
 * Return the maximum value of F(0), F(1), ..., F(n-1).
 *
 * The test cases are generated so that the answer fits in a 32-bit integer.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var maxRotateFunction = function(nums) {
  const sum = nums.reduce((a, b) => a + b, 0);
  let current = nums.reduce((total, n, i) => total + i * n, 0);
  let result = current;

  for (let i = 1; i < nums.length; i++) {
    current = current + sum - nums.length * nums[nums.length - i];
    result = Math.max(result, current);
  }

  return result;
};
```

0397 Integer Replacement

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 397. Integer Replacement
 * https://leetcode.com/problems/integer-replacement/
 * Difficulty: Medium
 *
 * Given a positive integer n, you can apply one of the following operations:
 * 1. If n is even, replace n with n / 2.
 * 2. If n is odd, replace n with either n + 1 or n - 1.
 *
 * Return the minimum number of operations needed for n to become 1.
 */

/**
 * @param {number} n
 * @return {number}
 */
/**
 * @param {number} n
 * @param {number} count
 * @return {number}
 */
var integerReplacement = function(n, count = 0) {
  if (n === 1) return count;
  if (n % 2 === 0) {
    return integerReplacement(n / 2, count + 1);
  } else {
    return Math.min(integerReplacement(n + 1, count + 1), integerReplacement(n - 1, count +
1));
  }
};
```

0398 Random Pick Index

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 398. Random Pick Index
 * https://leetcode.com/problems/random-pick-index/
 * Difficulty: Medium
 *
 * Given an integer array nums with possible duplicates, randomly output the index of a given
 * target number. You can assume that the given target number must exist in the array.
 *
 * Implement the Solution class:
 * - Solution(int[] nums) Initializes the object with the array nums.
 * - int pick(int target) Picks a random index i from nums where nums[i] == target. If there
 *   are multiple valid i's, then each index should have an equal probability of returning.
 */

/**
 * @param {number[]} nums
 */
var Solution = function(nums) {
  this.map = new Map();
  for (let i = 0; i < nums.length; i++) {
    if (!this.map.has(nums[i])) {
      this.map.set(nums[i], []);
    }
    this.map.get(nums[i]).push(i);
  }
};

/**
 * @param {number} target
 * @return {number}
 */
Solution.prototype.pick = function(target) {
  const result = this.map.get(target);
  return result[Math.floor(Math.random() * result.length)];
};
```

0399 Evaluate Division

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 399. Evaluate Division
 * https://leetcode.com/problems/evaluate-division/
 * Difficulty: Medium
 *
 * You are given an array of variable pairs equations and an array of real numbers values,
 * where equations[i] = [Ai, Bi] and values[i] represent the equation Ai / Bi = values[i].
 * Each Ai or Bi is a string that represents a single variable.
 *
 * You are also given some queries, where queries[j] = [Cj, Dj] represents the jth query
 * where you must find the answer for Cj / Dj = ?.
 *
 * Return the answers to all queries. If a single answer cannot be determined, return -1.0.
 *
 * Note: The input is always valid. You may assume that evaluating the queries will not
 * result in division by zero and that there is no contradiction.
 *
 * Note: The variables that do not occur in the list of equations are undefined, so the
 * answer cannot be determined for them.
 */
```

```
/**
 * @param {string[][]} equations
 * @param {number[]} values
 * @param {string[][]} queries
 * @return {number[]}
 */
var calcEquation = function(equations, values, queries) {
  const map = equations.reduce((result, [a, b], index) => {
    result.set(a, [...(result.get(a) ?? []), [b, values[index]]]);
    result.set(b, [...(result.get(b) ?? []), [a, 1 / values[index]]]);
    return result;
  }, new Map());

  function traverse([a, b], seen = new Set(), current = 1) {
    if (!map.has(a) || !map.has(b)) return -1;
    if (a === b) return current;
    seen.add(a);

    for (const [key, value] of map.get(a)) {
      if (seen.has(key)) continue;
      const result = traverse([key, b], seen, current * value);
      if (result) return result;
    }
    return null;
  }

  return queries.map(item => traverse(item) ?? -1);
};
```

0400 Nth Digit

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 400. Nth Digit
 * https://leetcode.com/problems/nth-digit/
 * Difficulty: Medium
 *
 * Given an integer n, return the nth digit of the infinite integer sequence
 * [1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, ...].
 */

/**
 * @param {number} n
 * @return {number}
 */
var findNthDigit = function(n) {
  let total = 1;
  let start = 1;

  for (let count = 9; n > total * count; total++, count *= 10, start *= 10) {
    n -= total * count;
  }

  start += Math.floor((n - 1) / total);
  return +(start.toString()[(n - 1) % total]);
};
```

0401 Binary Watch

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 401. Binary Watch
 * https://leetcode.com/problems/binary-watch/
```

```
 * Difficulty: Easy
 *
 * A binary watch has 4 LEDs on the top to represent the hours (0-11), and 6 LEDs on the
bottom
 * to represent the minutes (0-59). Each LED represents a zero or one, with the least
significant
 * bit on the right.
 * - For example, the below binary watch reads "4:51".
 * Given an integer turnedOn which represents the number of LEDs that are currently on
(ignoring
 * the PM), return all possible times the watch could represent. You may return the answer in
 * any order.
 * The hour must not contain a leading zero.
 * - For example, "01:00" is not valid. It should be "1:00".
 * The minute must consist of two digits and may contain a leading zero.
 * - For example, "10:2" is not valid. It should be "10:02".
 */

/**
 * @param {number} turnedOn
 * @return {string[]}
 */
var readBinaryWatch = function(turnedOn) {
  const result = [];

  for (let h = 0; h < 12; h++) {
    for (let m = 0; m < 60; m++) {
      if (h.toString(2).split('1').length - 1 + m.toString(2).split('1').length - 1 ===
turnedOn) {
        result.push(`${h}:${m < 10 ? '0' + m : m}`);
      }
    }
  }

  return result;
};
```

0402 Remove K Digits

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 402. Remove K Digits
 * https://leetcode.com/problems/remove-k-digits/
 * Difficulty: Medium
 *
 * Given string num representing a non-negative integer num, and an integer k, return
 * the smallest possible integer after removing k digits from num.
 */

/**
 * @param {string} num
 * @param {number} k
 * @return {string}
 */
var removeKdigits = function(num, k) {
  const stack = [];

  for (const n of num) {
    while (k > 0 && stack.length && stack[stack.length - 1] > n) {
      stack.pop();
      k--;
    }
    stack.push(n);
  }

  while (k > 0) {
    stack.pop();
    k--;
  }
```

```
  const result = stack.join('').replace(/^0+/, '');
  return result.length ? result : '0';
};
```

0403 Frog Jump

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 403. Frog Jump
 * https://leetcode.com/problems/frog-jump/
 * Difficulty: Hard
 *
 * A frog is crossing a river. The river is divided into some number of units, and at each
 * unit, there may or may not exist a stone. The frog can jump on a stone, but it must not
 * jump into the water.
 *
 * Given a list of stones positions (in units) in sorted ascending order, determine if the
 * frog can cross the river by landing on the last stone. Initially, the frog is on the
 * first stone and assumes the first jump must be 1 unit.
 *
 * If the frog's last jump was k units, its next jump must be either k - 1, k, or k + 1
 * units. The frog can only jump in the forward direction.
 */

/**
 * @param {number[]} stones
 * @return {boolean}
 */
var canCross = function(stones) {
  const dp = new Map();
  stones.forEach(stone => dp.set(stone, new Set()));
  dp.get(0).add(0);

  for (let i = 0; i < stones.length; i++) {
    const curr = stones[i];
    for (const prevJump of dp.get(curr)) {
      for (const jump of [prevJump - 1, prevJump, prevJump + 1]) {
        if (jump > 0 && dp.has(curr + jump)) {
          dp.get(curr + jump).add(jump);
        }
      }
    }
  }

  return dp.get(stones[stones.length - 1]).size > 0;
};
```

0404 Sum Of Left Leaves

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 404. Sum of Left Leaves
 * https://leetcode.com/problems/sum-of-left-leaves/
 * Difficulty: Easy
 *
 * Given the root of a binary tree, return the sum of all left leaves.
 *
 * A leaf is a node with no children. A left leaf is a leaf that is the left child of another
node.
 */

/**
```

```
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root

  return sumOfLeftLeaves(root.left, true) + sumOfLeftLeaves(root.right);
};
```

0405 Convert A Number To Hexadecimal

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 405. Convert a Number to Hexadecimal
 * https://leetcode.com/problems/convert-a-number-to-hexadecimal/
 * Difficulty: Easy
 *
 * Given an integer num, return a string representing its hexadecimal
 * representation. For negative integers, two’s complement method is used.
 *
 * All the letters in the answer string should be lowercase characters,
 * and there should not be any leading zeros in the answer except for
 * the zero itself.
 *
 * Note: You are not allowed to use any built-in library method to directly
 * solve this problem.
 */

/**
 * @param {number} num
 * @return {string}
 */
var toHex = function(num) {
  if (num === 0) {
    return num.toString();
  }
  const words = '0123456789abcdef';
  let result = '';
  while (num !== 0) {
    result = words[num & 0xf] + result;
    num >>>= 4;
  }
  return result;
};
```

0406 Queue Reconstruction By Height

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 406. Queue Reconstruction by Height
 * https://leetcode.com/problems/queue-reconstruction-by-height/
 * Difficulty: Medium
 *
 * You are given an array of people, people, which are the attributes of some people in a
```

```
queue
 * (not necessarily in order). Each people[i] = [hi, ki] represents the ith person of height
 * hi with exactly ki other people in front who have a height greater than or equal to hi.
 *
 * Reconstruct and return the queue that is represented by the input array people. The
returned
 * queue should be formatted as an array queue, where queue[j] = [hj, kj] is the attributes of
 * the jth person in the queue (queue[0] is the person at the front of the queue).
 */

/**
 * @param {number[][]} people
 * @return {number[][]}
 */
var reconstructQueue = function(people) {
  return people
    .sort(([h1, k1], [h2, k2]) => h2 - h1 || k1 - k2)
    .reduce((queue, person) => queue.splice(person[1], 0, person) && queue, []);
};
```

0407 Trapping Rain Water Ii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 407. Trapping Rain Water II
 * https://leetcode.com/problems/trapping-rain-water-ii/
 * Difficulty: Hard
 *
 * Given an m x n integer matrix heightMap representing the height of each unit cell in a 2D
 * elevation map, return the volume of water it can trap after raining.
 */

/**
 * @param {number[][]} heightMap
 * @return {number}
 */
var trapRainWater = function(heightMap) {
  const minHeap = new MinPriorityQueue({ priority: ([value]) => value });
  const history = new Array(heightMap.length).fill(0)
    .map(() => new Array(heightMap[0].length).fill(false));

  for (let i = 0; i < heightMap.length; i++) {
    for (let j = 0; j < heightMap[0].length; j++) {
      if (i === 0 || i === heightMap.length - 1 || j === 0 || j === heightMap[0].length - 1) {

        ]);
        history[rowIndex][columnIndex] = true;
      }
    });
  }

  return result;
};
```

0408 Valid Word Abbreviation

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 408. Valid Word Abbreviation
 * https://leetcode.com/problems/valid-word-abbreviation/
 * Difficulty: Easy
 *
 * A string can be abbreviated by replacing any number of non-adjacent, non-empty substrings
 * with their lengths. The lengths should not have leading zeros.
 *
 * For example, a string such as "substitution" could be abbreviated as (but not limited to):
 * - "s10n" ("s ubstitutio n")
 * - "sub4u4" ("sub stit u tion")
 * - "12" ("substitution")
 * - "su3i1u2on" ("su bst i t u ti on")
 * - "substitution" (no substrings replaced)
 *
 * The following are not valid abbreviations:
 * - "s55n" ("s ubsti tutio n", the replaced substrings are adjacent)
 * - "s010n" (has leading zeros)
 * - "s0ubstitution" (replaces an empty substring)
 *
 * Given a string word and an abbreviation abbr, return whether the string matches the given
 * abbreviation.
 *
 * A substring is a contiguous non-empty sequence of characters within a string.
 */

/**
 * @param {string} word
 * @param {string} abbr
 * @return {boolean}
 */
var validWordAbbreviation = function(word, abbr) {
  let wordIndex = 0;
  let abbrIndex = 0;

  }

  return left;
};
```

0411 Minimum Unique Word Abbreviation

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 411. Minimum Unique Word Abbreviation
 * https://leetcode.com/problems/minimum-unique-word-abbreviation/
 * Difficulty: Hard
 *
 * A string can be abbreviated by replacing any number of non-adjacent substrings with their
 * lengths. For example, a string such as "substitution" could be abbreviated as (but not
 * limited to):
 * - "s10n" ("s ubstitutio n")
 * - "sub4u4" ("sub stit u tion")
 * - "12" ("substitution")
 * - "su3i1u2on" ("su bst i t u ti on")
 * - "substitution" (no substrings replaced)
 *
 * Note that "s55n" ("s ubsti tutio n") is not a valid abbreviation of "substitution" because
 * the replaced substrings are adjacent.
 *
 * The length of an abbreviation is the number of letters that were not replaced plus the
 * number of substrings that were replaced. For example, the abbreviation "s10n" has a length
 * of 3 (2 letters + 1 substring) and "su3i1u2on" has a length of 9 (6 letters + 3
substrings).
 *
 * Given a target string target and an array of strings dictionary, return an abbreviation
 * of target with the shortest possible length such that it is not an abbreviation of any
 * string in dictionary. If there are multiple shortest abbreviations, return any of them.
 */

0414 Third Maximum Number

EASY

APPROACH NOTES

Uses a Set for unique membership. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 414. Third Maximum Number
 * https://leetcode.com/problems/third-maximum-number/
 * Difficulty: Easy
 *
 * Given an integer array nums, return the third distinct maximum number in this array.
 * If the third maximum does not exist, return the maximum number.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var thirdMax = function(nums) {
  const sortedSet = [...new Set(nums)].sort((a, b) => a - b);
  const thirdMax = sortedSet[sortedSet.length - 3];

  return thirdMax !== undefined
    ? thirdMax
    : sortedSet[sortedSet.length - 1];
};
```

0415 Add Strings

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 415. Add Strings
 * https://leetcode.com/problems/add-strings/
 * Difficulty: Easy
 *
 * Given two non-negative integers, num1 and num2 represented as string, return the sum of
num1 and
 * num2 as a string.
 *
 * You must solve the problem without using any built-in library for handling large integers
(such
 * as BigInteger). You must also not convert the inputs to integers directly.
 */

/**
 * @param {string} num1
 * @param {string} num2
 * @return {string}
 */

    }
    set = next;
```

```
  }

  return false;
};
```

0417 Pacific Atlantic Water Flow

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 417. Pacific Atlantic Water Flow
 * https://leetcode.com/problems/pacific-atlantic-water-flow/
 * Difficulty: Medium
 *
 * There is an m x n rectangular island that borders both the Pacific Ocean and Atlantic
Ocean.
 * The Pacific Ocean touches the island's left and top edges, and the Atlantic Ocean touches
 * the island's right and bottom edges.
 *
 * The island is partitioned into a grid of square cells. You are given an m x n integer
 * matrix heights where heights[r][c] represents the height above sea level of the cell
 * at coordinate (r, c).
 *
 * The island receives a lot of rain, and the rain water can flow to neighboring cells
directly
 * north, south, east, and west if the neighboring cell's height is less than or equal to the
 * current cell's height. Water can flow from any cell adjacent to an ocean into the ocean.
 *
 * Return a 2D list of grid coordinates result where result[i] = [ri, ci] denotes that rain
water
 * can flow from cell (ri, ci) to both the Pacific and Atlantic oceans.
 */

/**
 * @param {number[][]} heights
 * @return {number[][]}
 */
var pacificAtlantic = function(heights) {
  const result = [];
  const pacific = new Set();
  const atlantic = new Set();

0426 Convert Binary Search Tree To Sorted Doubly Linked List

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 426. Convert Binary Search Tree to Sorted Doubly Linked List
 * https://leetcode.com/problems/convert-binary-search-tree-to-sorted-doubly-linked-list/
 * Difficulty: Medium
 *
 * Convert a Binary Search Tree to a sorted Circular Doubly-Linked List in place.
 *
 * You can think of the left and right pointers as synonymous to the predecessor and successor
 * pointers in a doubly-linked list. For a circular doubly linked list, the predecessor of the
 * first element is the last element, and the successor of the last element is the first
element.
 *
 * We want to do the transformation in place. After the transformation, the left pointer of
the
 * tree node should point to its predecessor, and the right pointer should point to its
successor.
 * You should return the pointer to the smallest element of the linked list.
 */

/**
 * // Definition for a _Node.
 * function _Node(val, left, right) {
 *      this.val = val;
 *      this.left = left;
 *      this.right = right;
 *  };
 */

/**
 * @param {_Node} root
 * @return {_Node}
 */

```

0427 Construct Quad Tree

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 427. Construct Quad Tree
 * https://leetcode.com/problems/construct-quad-tree/
 * Difficulty: Medium
 *
 * Given a n * n matrix grid of 0's and 1's only. We want to represent grid with a Quad-Tree.
 *
 * Return the root of the Quad-Tree representing grid.
 *
 * A Quad-Tree is a tree data structure in which each internal node has exactly four children.
 * Besides, each node has two attributes:
 * - val: True if the node represents a grid of 1's or False if the node represents a grid of
 *   0's. Notice that you can assign the val to True or False when isLeaf is False, and both
are
 *   accepted in the answer.
 * - isLeaf: True if the node is a leaf node on the tree or False if the node has four
children.
 */

/**
 * // Definition for a QuadTree node.
 * function _Node(val,isLeaf,topLeft,topRight,bottomLeft,bottomRight) {
 *    this.val = val;
 *    this.isLeaf = isLeaf;
 *    this.topLeft = topLeft;
 *    this.topRight = topRight;
 *    this.bottomLeft = bottomLeft;
 *    this.bottomRight = bottomRight;
 * };
 */

/**
 * @param {number[][]} grid
 * @return {_Node}
 */
var construct = function(grid) {
  return build(0, 0, grid.length);

  function build(x, y, n) {
    const value = grid[x][y];

            build(x, y + n, n),
            build(x + n, y, n),
            build(x + n, y + n, n)
          );
        }
      }
    }
    return new _Node(value === 1, true, null, null, null, null);
  }
};
```

0428 Serialize And Deserialize N Ary Tree

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 428. Serialize and Deserialize N-ary Tree
 * https://leetcode.com/problems/serialize-and-deserialize-n-ary-tree/
 * Difficulty: Hard
 *
 * Serialization is the process of converting a data structure or object into a sequence of
 * bits so that it can be stored in a file or memory buffer, or transmitted across a network
 * connection link to be reconstructed later in the same or another computer environment.
 *
 * Design an algorithm to serialize and deserialize an N-ary tree. An N-ary tree is a rooted
 * tree in which each node has no more than N children. There is no restriction on how your
 * serialization/deserialization algorithm should work. You just need to ensure that an N-ary
 * tree can be serialized to a string and this string can be deserialized to the original
 * tree structure.
 *
 * For example, you may serialize the following 3-ary tree as [1 [3[5 6] 2 4]]. Note that
 * this is just an example, you do not necessarily need to follow this format.
 *
 * Or you can follow LeetCode's level order traversal serialization format, where each
 * group of children is separated by the null value.
 *
 * For example, the above tree may be serialized as
 * [1,null,2,3,4,5,null,null,6,7,null,8,null,9,10,null,null,11,null,12,null,13,null,null,14].
 *
 * You do not necessarily need to follow the above-suggested formats, there are many more
 * different formats that work so please be creative and come up with different approaches
 * yourself.
 */

/**
 * // Definition for a _Node.
 * function _Node(val,children) {
 *    this.val = val;
 *    this.children = children;
 * };
 */

class Codec {
  constructor() {}

  serialize = function(root) {
    if (!root) return '';
    const result = [];

    function serializeNode(node) {
      result.push(node.val);
      result.push(node.children.length);
      for (const child of node.children) {
        serializeNode(child);
      }
    }
```

```
    serializeNode(root);
    return result.join(',');
  };

  deserialize = function(data) {
    if (!data) return null;
    const values = data.split(',').map(Number);
    let index = 0;

    function deserializeNode() {
      const val = values[index++];
      const childCount = values[index++];
      const children = [];
      for (let i = 0; i < childCount; i++) {
        children.push(deserializeNode());
      }
      return new _Node(val, children);
    }

    return deserializeNode();
  };
}
```

0429 N Ary Tree Level Order Traversal

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 429. N-ary Tree Level Order Traversal
 * https://leetcode.com/problems/n-ary-tree-level-order-traversal/
 * Difficulty: Medium
 *
 * Given an n-ary tree, return the level order traversal of its nodes' values.
 *
 * Nary-Tree input serialization is represented in their level order traversal, each group of
 * children is separated by the null value.
 */

0430 Flatten A Multilevel Doubly Linked List

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 430. Flatten a Multilevel Doubly Linked List
 * https://leetcode.com/problems/flatten-a-multilevel-doubly-linked-list/
 * Difficulty: Medium
 *
 * You are given a doubly linked list, which contains nodes that have a next pointer, a
previous
 * pointer, and an additional child pointer. This child pointer may or may not point to a
separate
 * doubly linked list, also containing these special nodes. These child lists may have one or
more
 * children of their own, and so on, to produce a multilevel data structure as shown in the
example
 * below.
 *
 * Given the head of the first level of the list, flatten the list so that all the nodes
appear in
 * a single-level, doubly linked list. Let curr be a node with a child list. The nodes in the
child
 * list should appear after curr and before curr.next in the flattened list.
 *
 * Return the head of the flattened list. The nodes in the list must have all of their child
 * pointers set to null.
 */

/**
 * // Definition for a _Node.
 * function _Node(val,prev,next,child) {
 *    this.val = val;
 *    this.prev = prev;
 *    this.next = next;
 *    this.child = child;
 * };
 */

/**
 * @param {_Node} head
 * @return {_Node}
 */
var flatten = function(head) {
  if (!head) return null;

  let current = head;
  while (current) {
    if (!current.child) {
      current = current.next;
    } else {
      const { child, next } = current;
      current.child = null;
      current.next = child;
      child.prev = current;

      let tail = child;
      while (tail.next) {
        tail = tail.next;
      }

      tail.next = next;
      if (next) {
        next.prev = tail;
      }
      current = current.next;
    }
  }

  return head;
```

```
};
```

0431 Encode N Ary Tree To Binary Tree

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 431. Encode N-ary Tree to Binary Tree
 * https://leetcode.com/problems/encode-n-ary-tree-to-binary-tree/
 * Difficulty: Hard
 *
 * Design an algorithm to encode an N-ary tree into a binary tree and decode the binary tree
 * to get the original N-ary tree. An N-ary tree is a rooted tree in which each node has no
 * more than N children. Similarly, a binary tree is a rooted tree in which each node has no
 * more than 2 children. There is no restriction on how your encode/decode algorithm should
 * work. You just need to ensure that an N-ary tree can be encoded to a binary tree and this
 * binary tree can be decoded to the original N-nary tree structure.
 *
 * Nary-Tree input serialization is represented in their level order traversal, each group
 * of children is separated by the null value (See following example).
 *
 * For example, you may encode the following 3-ary tree to a binary tree in this way:
 * - Input: root = [1,null,3,2,4,null,5,6]
 *
 * Note that the above is just an example which might or might not work. You do not
necessarily
 * need to follow this format, so please be creative and come up with different approaches
yourself.
 */

/**
 * // Definition for a _Node.
 * function _Node(val,children) {
 *    this.val = val;
 *    this.children = children;
 * };
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val) {
 *     this.val = val;
 *     this.left = this.right = null;
 * }
 */

class Codec {
  constructor() {}

  encode = function(root) {
    if (!root) return null;

    const binaryRoot = new TreeNode(root.val);

    if (root.children.length > 0) {
      binaryRoot.left = this.encode(root.children[0]);
    }

    let sibling = binaryRoot.left;
    for (let i = 1; i < root.children.length; i++) {
      if (sibling) {
        sibling.right = this.encode(root.children[i]);
        sibling = sibling.right;
      }
    }

    return binaryRoot;
  };

  decode = function(root) {
```

```
    if (!root) return null;

    const updated = new _Node(root.val, []);
    let sibling = root.left;
    while (sibling) {
      updated.children.push(this.decode(sibling));
      sibling = sibling.right;
    }

    return updated;
  };
}
```

0432 All Oone Data Structure

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 432. All O`one Data Structure
 * https://leetcode.com/problems/all-oone-data-structure/
 * Difficulty: Hard
 *
 * Design a data structure to store the strings' count with the ability to return the strings
 * with minimum and maximum counts.
 *
 * Implement the AllOne class:
 * - AllOne() Initializes the object of the data structure.
 * - inc(String key) Increments the count of the string key by 1. If key does not exist in the
 *   data structure, insert it with count 1.
 * - dec(String key) Decrements the count of the string key by 1. If the count of key is 0
after
 *   the decrement, remove it from the data structure. It is guaranteed that key exists in the
 *   data structure before the decrement.
 * - getMaxKey() Returns one of the keys with the maximal count. If no element exists, return
 *   an empty string "".
 * - getMinKey() Returns one of the keys with the minimum count. If no element exists, return
 *   an empty string "".
 *
 * Note that each function must run in O(1) average time complexity.
 */

```

0433 Minimum Genetic Mutation

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 433. Minimum Genetic Mutation
 * https://leetcode.com/problems/minimum-genetic-mutation/
 * Difficulty: Medium
 *
 * A gene string can be represented by an 8-character long string, with choices from
 * 'A', 'C', 'G', and 'T'.
 *
 * Suppose we need to investigate a mutation from a gene string startGene to a gene
 * string endGene where one mutation is defined as one single character changed in the
 * gene string.
 *
 * For example, "AACCGGTT" --> "AACCGGTA" is one mutation.
 *
 * There is also a gene bank bank that records all the valid gene mutations. A gene must
 * be in bank to make it a valid gene string.
 *
```

```
 * Given the two gene strings startGene and endGene and the gene bank bank, return the
 * minimum number of mutations needed to mutate from startGene to endGene. If there is
 * no such a mutation, return -1.
 *
 * Note that the starting point is assumed to be valid, so it might not be included in
 * the bank.
 */

/**
 * @param {string} startGene
 * @param {string} endGene
 * @param {string[]} bank
 * @return {number}
 */

    }
    i--;
  }
  chars.length = pointer;
  return pointer;
};
```

0444 Sequence Reconstruction

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 444. Sequence Reconstruction
 * https://leetcode.com/problems/sequence-reconstruction/
 * Difficulty: Medium
 *
 * You are given an integer array nums of length n where nums is a permutation of the
 * integers in the range [1, n]. You are also given a 2D integer array sequences where
 * sequences[i] is a subsequence of nums.
 *
 * Check if nums is the shortest possible and the only supersequence. The shortest
 * supersequence is a sequence with the shortest length and has all sequences[i] as
 * subsequences. There could be multiple valid supersequences for the given array sequences.
 * - For example, for sequences = [[1,2],[1,3]], there are two shortest supersequences,
 *   [1,2,3] and [1,3,2].
 * - While for sequences = [[1,2],[1,3],[1,2,3]], the only shortest supersequence possible
 *   is [1,2,3]. [1,2,3,4] is a possible supersequence but not the shortest.
 *
 * Return true if nums is the only shortest supersequence for sequences, or false otherwise.
 *
 * A subsequence is a sequence that can be derived from another sequence by deleting some or
 * no elements without changing the order of the remaining elements.
 */

/**
 * @param {number[]} nums
 * @param {number[][]} sequences
 * @return {boolean}
 */
var sequenceReconstruction = function(nums, sequences) {

    const sum = (s1.pop() || 0) + (s2.pop() || 0) + carry;
    carry = sum / 10 | 0;
    head = Object.assign(new ListNode(sum % 10), { next: head });
  }

  return head;
};
```

0446 Arithmetic Slices Ii Subsequence

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 446. Arithmetic Slices II - Subsequence
 * https://leetcode.com/problems/arithmetic-slices-ii-subsequence/
 * Difficulty: Hard
 *
 * Given an integer array nums, return the number of all the arithmetic subsequences of nums.
 *
 * A sequence of numbers is called arithmetic if it consists of at least three elements and if
 * the difference between any two consecutive elements is the same.
 *
 * - For example, [1, 3, 5, 7, 9], [7, 7, 7, 7], and [3, -1, -5, -9] are arithmetic sequences.
 * - For example, [1, 1, 2, 5, 7] is not an arithmetic sequence.
 *
 * A subsequence of an array is a sequence that can be formed by removing some elements
(possibly
 * none) of the array.
 *
 * - For example, [2,5,10] is a subsequence of [1,2,1,2,4,1,5,10].
 *
 * The test cases are generated so that the answer fits in 32-bit integer.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var numberOfArithmeticSlices = function(nums) {
  const dp = new Array(nums.length).fill().map(() => new Map());
  let result = 0;

  for (let i = 1; i < nums.length; i++) {

```

0451 Sort Characters By Frequency

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 451. Sort Characters By Frequency
 * https://leetcode.com/problems/sort-characters-by-frequency/
 * Difficulty: Medium
 *
 * Given a string, sort it in decreasing order
 * based on the frequency of characters.
 */

/**
 * @param {string} s
 * @return {string}
 */
var frequencySort = function(s) {
  const map = new Map();
  s.split('').forEach(char => {
    map.set(char, map.has(char) ? map.get(char) + 1 : 1);
  });

  return [...map]
    .sort((a, b) => b[1] - a[1])
    .map(entry => entry[0].repeat(entry[1]))
    .join('');
};
```

0452 Minimum Number Of Arrows To Burst Balloons

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 452. Minimum Number of Arrows to Burst Balloons
 * https://leetcode.com/problems/minimum-number-of-arrows-to-burst-balloons/
 * Difficulty: Medium
 *
 * There are some spherical balloons taped onto a flat wall that represents the XY-plane.
 * The balloons are represented as a 2D integer array points where points[i] = [xstart, xend]
 * denotes a balloon whose horizontal diameter stretches between xstart and xend. You do not
 * know the exact y-coordinates of the balloons.
 *
 * Arrows can be shot up directly vertically (in the positive y-direction) from different
points
 * along the x-axis. A balloon with xstart and xend is burst by an arrow shot at x if
 * x(start) <= x <= x(end). There is no limit to the number of arrows that can be shot. A shot
 * arrow keeps traveling up infinitely, bursting any balloons in its path.
 *
 * Given the array points, return the minimum number of arrows that must be shot to burst all
 * balloons.
 */

/**
 * @param {number[][]} points
 * @return {number}
 */
var findMinArrowShots = function(points) {
  let result = 0;

    nums2.forEach(n2 => map.set(n1 + n2, (map.get(n1 + n2) || 0) + 1));
  });
  return nums3.reduce((count, n3) => {
    return count + nums4.reduce((sum, n4) => sum + (map.get(-(n3 + n4)) || 0), 0);
```

```
  }, 0);
};
```

0455 Assign Cookies

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 455. Assign Cookies
 * https://leetcode.com/problems/assign-cookies/
 * Difficulty: Easy
 *
 * Assume you are an awesome parent and want to give your children some cookies. But, you
 * should give each child at most one cookie.
 *
 * Each child i has a greed factor g[i], which is the minimum size of a cookie that the
 * child will be content with; and each cookie j has a size s[j]. If s[j] >= g[i], we can
 * assign the cookie j to the child i, and the child i will be content. Your goal is to
 * maximize the number of your content children and output the maximum number.
 */

/**
 * @param {number[]} g
 * @param {number[]} s
 * @return {number}
 */
var findContentChildren = function(g, s) {
  g.sort((a, b) => a - b);
  s.sort((a, b) => a - b);

  let result = 0;
  for (let j = 0; result < g.length && j < s.length; j++) {
    if (s[j] >= g[result]) {
      result++;
    }
  }

  return result;
};
```

0456 132 Pattern

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 456. 132 Pattern
 * https://leetcode.com/problems/132-pattern/
 * Difficulty: Medium
 *
 * Given an array of n integers nums, a 132 pattern is a subsequence of three integers
nums[i],
 * nums[j] and nums[k] such that i < j < k and nums[i] < nums[k] < nums[j].
 *
 * Return true if there is a 132 pattern in nums, otherwise, return false.
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */
var find132pattern = function(nums) {
  const stack = [];

  for (let i = nums.length - 1, j = -Infinity; i >= 0; i--) {
    while (nums[i] > stack[stack.length - 1]) {
```

```
      j = stack.pop();
    }
    if (nums[i] < j) {
      return true;
    }
    stack.push(nums[i]);
  }

  return false;
};
```

0457 Circular Array Loop

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 457. Circular Array Loop
 * https://leetcode.com/problems/circular-array-loop/
 * Difficulty: Medium
 *
 * You are playing a game involving a circular array of non-zero integers nums. Each nums[i]
 * denotes the number of indices forward/backward you must move if you are located at index i:
 * - If nums[i] is positive, move nums[i] steps forward, and
 * - If nums[i] is negative, move nums[i] steps backward.
 *
 * Since the array is circular, you may assume that moving forward from the last element puts
 * you on the first element, and moving backwards from the first element puts you on the last
 * element.
 *
 * A cycle in the array consists of a sequence of indices seq of length k where:
 * - Following the movement rules above results in the repeating index sequence seq[0] ->
seq[1]
 *   -> ... -> seq[k - 1] -> seq[0] -> ...
 * - Every nums[seq[j]] is either all positive or all negative.
 * - k > 1
 *
 * Return true if there is a cycle in nums, or false otherwise.
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */
var circularArrayLoop = function(nums) {
  const n = nums.length;

  for (let i = 0; i < n; i++) {
    if (dfs(i, i, nums[i] > 0)) return true;
  }

  return false;

  function dfs(current, prev, flag) {
    if (nums[current] === 0) return current != prev;
    if (flag != (nums[current] > 0)) return false;
    const moves = nums[current];
    nums[current] = 0;
    const next = (current + (moves % n) + n) % n;
    const result = dfs(next, current, flag);
    nums[current] = moves;
    return result;
  }
};
```

0458 Poor Pigs

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 458. Poor Pigs
 * https://leetcode.com/problems/poor-pigs/
 * Difficulty: Hard
 *
 * There are buckets buckets of liquid, where exactly one of the buckets is poisonous. To
figure
 * out which one is poisonous, you feed some number of (poor) pigs the liquid to see whether
 * they will die or not. Unfortunately, you only have minutesToTest minutes to determine which
 * bucket is poisonous.
 *
 * You can feed the pigs according to these steps:
 * 1. Choose some live pigs to feed.
 * 2. For each pig, choose which buckets to feed it. The pig will consume all the chosen
buckets
 *    simultaneously and will take no time. Each pig can feed from any number of buckets, and
each
 *    bucket can be fed from by any number of pigs.
 * 3. Wait for minutesToDie minutes. You may not feed any other pigs during this time.
 * 4. After minutesToDie minutes have passed, any pigs that have been fed the poisonous bucket
 *    will die, and all others will survive.
 * 5. Repeat this process until you run out of time.
 *
 * Given buckets, minutesToDie, and minutesToTest, return the minimum number of pigs needed to
 * figure out which bucket is poisonous within the allotted time.
 */

/**
 * @param {number} buckets
 * @param {number} minutesToDie
 * @param {number} minutesToTest
 * @return {number}
 */
var poorPigs = function(buckets, minutesToDie, minutesToTest) {
  const max = Math.floor(minutesToTest / minutesToDie) + 1;
  let result = 0;

  while (Math.pow(max, result) < buckets) {
    result++;
  }

  return result;
};
```

0459 Repeated Substring Pattern

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 459. Repeated Substring Pattern
 * https://leetcode.com/problems/repeated-substring-pattern/
 * Difficulty: Easy
 *
 * Given a non-empty string check if it can be constructed by taking a
 * substring of it and appending multiple copies of the substring
 * together. You may assume the given string consists of lowercase
 * English letters only and its length will not exceed 10000.
 */

/**
 * @param {string} s
```

```
 * @return {boolean}
 */
var repeatedSubstringPattern = function(s) {
  return (s + s).slice(1, s.length * 2 - 1).indexOf(s) !== -1;
};
```

0460 Lfu Cache

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 460. LFU Cache
 * https://leetcode.com/problems/lfu-cache/
 * Difficulty: Hard
 *
 * Design and implement a data structure for a Least Frequently Used (LFU) cache.
 *
 * Implement the LFUCache class:
 * - LFUCache(int capacity) Initializes the object with the capacity of the data structure.
 * - int get(int key) Gets the value of the key if the key exists in the cache. Otherwise,
 *   returns -1.
 * - void put(int key, int value) Update the value of the key if present, or inserts the
 *   key if not already present. When the cache reaches its capacity, it should invalidate
 *   and remove the least frequently used key before inserting a new item. For this problem,
 *   when there is a tie (i.e., two or more keys with the same frequency), the least recently
 *   used key would be invalidated.
 *
 * To determine the least frequently used key, a use counter is maintained for each key in
 * the cache. The key with the smallest use counter is the least frequently used key.
 *
 * When a key is first inserted into the cache, its use counter is set to 1 (due to the
 * put operation). The use counter for a key in the cache is incremented either a get or
 * put operation is called on it.
 *
 * The functions get and put must each run in O(1) average time complexity.
 */

/**
 * @param {number} capacity
 */

};
```

0463 Island Perimeter

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 463. Island Perimeter
 * https://leetcode.com/problems/island-perimeter/
 * Difficulty: Medium
 *
 * You are given row x col grid representing a map where grid[i][j] = 1 represents land and
 * grid[i][j] = 0 represents water.
 *
 * Grid cells are connected horizontally/vertically (not diagonally). The grid is completely
 * surrounded by water, and there is exactly one island (i.e., one or more connected land
cells).
 *
 * The island doesn't have "lakes", meaning the water inside isn't connected to the water
around
 * the island. One cell is a square with side length 1. The grid is rectangular, width and
height
 * don't exceed 100. Determine the perimeter of the island.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var islandPerimeter = function(grid) {
  let island = 0;
  let adjacent = 0;

      }
    }
  }

  return island * 4 - adjacent * 2;
};
```

0464 Can I Win

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 464. Can I Win
 * https://leetcode.com/problems/can-i-win/
 * Difficulty: Medium
 *
 * In the "100 game" two players take turns adding, to a running total, any integer from 1 to
10.
 * The player who first causes the running total to reach or exceed 100 wins.
 *
 * What if we change the game so that players cannot re-use integers?
 *
 * For example, two players might take turns drawing from a common pool of numbers from 1 to
15
 * without replacement until they reach a total >= 100.
 *
 * Given two integers maxChoosableInteger and desiredTotal, return true if the first player to
 * move can force a win, otherwise, return false. Assume both players play optimally.
 */

/**
 * @param {number} maxChoosableInteger
 * @param {number} desiredTotal
 * @return {boolean}
 */
var canIWin = function(maxChoosableInteger, desiredTotal) {
  const memo = new Map();
  const sum = (maxChoosableInteger * (maxChoosableInteger + 1)) / 2;

  if (desiredTotal <= 0) return true;
  if (sum < desiredTotal) return false;

  return check(0, desiredTotal);

  function check(state, remaining) {
    if (remaining <= 0) return false;

    const key = state.toString();
    if (memo.has(key)) return memo.get(key);

    for (let i = 1; i <= maxChoosableInteger; i++) {
      const mask = 1 << i;
      if (!(state & mask) && (i >= remaining || !check(state | mask, remaining - i))) {
        memo.set(key, true);
        return true;
      }
    }

    memo.set(key, false);
    return false;
  }

    maxLength[index] = Math.max(maxLength[index], count);
  }

  return maxLength.reduce((sum, n) => sum + n, 0);
};
```

0468 Validate Ip Address

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 468. Validate IP Address
 * https://leetcode.com/problems/validate-ip-address/
 * Difficulty: Medium
 *
 * Given a string queryIP, return "IPv4" if IP is a valid IPv4 address, "IPv6" if IP is a
valid
 * IPv6 address or "Neither" if IP is not a correct IP of any type.
 *
 * A valid IPv4 address is an IP in the form "x1.x2.x3.x4" where 0 <= xi <= 255 and xi cannot
 * contain leading zeros. For example, "192.168.1.1" and "192.168.1.0" are valid IPv4
addresses
 * while "192.168.01.1", "192.168.1.00", and "192.168@1.1" are invalid IPv4 addresses.
 *
 * A valid IPv6 address is an IP in the form "x1:x2:x3:x4:x5:x6:x7:x8" where:
 * - 1 <= xi.length <= 4
 * - xi is a hexadecimal string which may contain digits, lowercase English letter ('a' to
'f')
 *   and upper-case English letters ('A' to 'F').
 * - Leading zeros are allowed in xi.
 *
 * For example, "2001:0db8:85a3:0000:0000:8a2e:0370:7334" and
"2001:db8:85a3:0:0:8A2E:0370:7334"
 * are valid IPv6 addresses, while "2001:0db8:85a3::8A2E:037j:7334" and
 * "02001:0db8:85a3:0000:0000:8a2e:0370:7334" are invalid IPv6 addresses.
 */

/**
 * @param {string} queryIP
 * @return {string}
 */
var validIPAddress = function(queryIP) {
  const ipv4 =
/^((\d|[1-9]\d|1\d\d|2[0-4]\d|25[0-5])\.){3}(\d|[1-9]\d|1\d\d|2[0-4]\d|25[0-5])$/;
  const ipv6 = /^([\da-fA-F]{1,4}:){7}[\da-fA-F]{1,4}$/;

  return ipv4.test(queryIP) ? 'IPv4' : ipv6.test(queryIP) ? 'IPv6' : 'Neither';
};
```

0469 Convex Polygon

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 469. Convex Polygon
 * https://leetcode.com/problems/convex-polygon/
 * Difficulty: Medium
 *
 * You are given an array of points on the X-Y plane points where points[i] = [xi, yi].
 * The points form a polygon when joined sequentially.
 *
 * Return true if this polygon is convex and false otherwise.
 *
 * You may assume the polygon formed by given points is always a simple polygon. In other
 * words, we ensure that exactly two edges intersect at each vertex and that edges otherwise
 * don't intersect each other.
 */

/**
 * @param {number[][]} points
 * @return {boolean}
```

```
 */
var isConvex = function(points) {
  const n = points.length;

```
/**
 * 475. Heaters
 * https://leetcode.com/problems/heaters/
 * Difficulty: Medium
 *
 * Winter is coming! During the contest, your first job is to design a standard heater with
 * a fixed warm radius to warm all the houses.
 *
 * Every house can be warmed, as long as the house is within the heater's warm radius range.
 *
 * Given the positions of houses and heaters on a horizontal line, return the minimum radius
 * standard of heaters so that those heaters could cover all houses.
```

```
 *
 * Notice that all the heaters follow your radius standard, and the warm radius will the same.
 */

/**
 * @param {number[]} houses
 * @param {number[]} heaters
 * @return {number}
 */
var findRadius = function(houses, heaters) {
  let result = 0;

  houses.sort((a, b) => a - b);
  heaters.sort((a, b) => a - b);
  for (let i = 0, j = 0; i < houses.length; i++) {
    while (j < heaters.length - 1 && houses[i] - heaters[j] > heaters[j + 1] - houses[i]) {
      j++;
    }
    result = Math.max(result, Math.abs(heaters[j] - houses[i]));
  }

  return result;
};
```

0476 Number Complement

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 476. Number Complement
 * https://leetcode.com/problems/number-complement/
 * Difficulty: Easy
 *
 * The complement of an integer is the integer you get when you flip all the 0's to 1's
 * and all the 1's to 0's in its binary representation.
 *
 * For example, The integer 5 is "101" in binary and its complement is "010" which is
 * the integer 2.
 *
 * Given an integer num, return its complement.
 */

/**
 * @param {number} num
 * @return {number}
 */
var findComplement = function(num) {
  return parseInt(num.toString(2).split('').map(n => 1 - n).join(''), 2);
};
```

0477 Total Hamming Distance

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 477. Total Hamming Distance
 * https://leetcode.com/problems/total-hamming-distance/
 * Difficulty: Medium
 *
 * The Hamming distance between two integers is the number of positions at which the
 * corresponding bits are different.
 *
 * Given an integer array nums, return the sum of Hamming distances between all the
 * pairs of the integers in nums.
 */
```

```
/**
 * @param {number[]} nums
 * @return {number}
 */

```

0480 Sliding Window Median

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 480. Sliding Window Median
 * https://leetcode.com/problems/sliding-window-median/
 * Difficulty: Hard
 *
 * The median is the middle value in an ordered integer list. If the size of the list is even,
 * there is no middle value. So the median is the mean of the two middle values.
 *
 * - For examples, if arr = [2,3,4], the median is 3.
 * - For examples, if arr = [1,2,3,4], the median is (2 + 3) / 2 = 2.5.
 *
 * You are given an integer array nums and an integer k. There is a sliding window of size k
 * which is moving from the very left of the array to the very right. You can only see the k
 * numbers in the window. Each time the sliding window moves right by one position.
 *
 * Return the median array for each window in the original array. Answers within 10-5 of the
 * actual value will be accepted.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number[]}
 */
var medianSlidingWindow = function(nums, k) {
  const maxHeap = new MaxPriorityQueue();
  const minHeap = new MinPriorityQueue();
  const result = [];
  const map = {};

  for (let i = 0; i < k; i++) maxHeap.enqueue(nums[i]);
  for (let i = 0; i < k >> 1; i++) minHeap.enqueue(maxHeap.dequeue());
  for (let i = k; i <= nums.length; i++) {
    result.push(k & 1 ? maxHeap.front() : (maxHeap.front() + minHeap.front()) / 2);
    if (i === nums.length) break;
    map[nums[i - k]] = (map[nums[i - k]] || 0) + 1;
    const balance = (nums[i - k] <= maxHeap.front() ? -1 : 1)
      + (nums[i] <= maxHeap.front() ? 1 : -1);
    nums[i] <= maxHeap.front() ? maxHeap.enqueue(nums[i]) : minHeap.enqueue(nums[i]);
    balance < 0 && minHeap.size() && maxHeap.enqueue(minHeap.dequeue());
```

```
    balance > 0 && maxHeap.size() && minHeap.enqueue(maxHeap.dequeue());
    while (maxHeap.size() && map[maxHeap.front()]) map[maxHeap.dequeue()]--;
    while (minHeap.size() && map[minHeap.front()]) map[minHeap.dequeue()]--;
  }

  return result;
};
```

0481 Magical String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 481. Magical String
 * https://leetcode.com/problems/magical-string/
 * Difficulty: Medium
 *
 * A magical string s consists of only '1' and '2' and obeys the following rules:
 * - The string s is magical because concatenating the number of contiguous occurrences of
 *   characters '1' and '2' generates the string s itself.
 * - The first few elements of s is s = "1221121221221121122……". If we group the consecutive
 *   1's and 2's in s, it will be "1 22 11 2 1 22 1 22 11 2 11 22 ......" and the occurrences
 *   of 1's or 2's in each group are "1 2 2 1 1 2 1 2 2 1 2 2 ......". You can see that the
 *   occurrence sequence is s itself.
 *
 * Given an integer n, return the number of 1's in the first n number in the magical string s.
 */

0488 Zuma Game

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 488. Zuma Game
 * https://leetcode.com/problems/zuma-game/
 * Difficulty: Hard
 *
 * You are playing a variation of the game Zuma.
 *
 * In this variation of Zuma, there is a single row of colored balls on a board, where each
ball
 * can be colored red 'R', yellow 'Y', blue 'B', green 'G', or white 'W'. You also have
several
 * colored balls in your hand.
 *
 * Your goal is to clear all of the balls from the board. On each turn:
 * - Pick any ball from your hand and insert it in between two balls in the row or on either
end
 *   of the row.
 * - If there is a group of three or more consecutive balls of the same color, remove the
group of
 *   balls from the board.
 *   - If this removal causes more groups of three or more of the same color to form, then
continue
 *     removing each group until there are none left.
 * - If there are no more balls on the board, then you win the game.
 * - Repeat this process until you either win or do not have any more balls in your hand.
 *
 * Given a string board, representing the row of balls on the board, and a string hand,
representing
 * the balls in your hand, return the minimum number of balls you have to insert to clear all
the
 * balls from the board. If you cannot clear all the balls from the board using the balls in
your
 * hand, return -1.

```

0489 Robot Room Cleaner

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 489. Robot Room Cleaner
 * https://leetcode.com/problems/robot-room-cleaner/
 * Difficulty: Hard
 *
 * You are controlling a robot that is located somewhere in a room. The room is modeled as an
m x n
 * binary grid where 0 represents a wall and 1 represents an empty slot.
 *
 * The robot starts at an unknown location in the room that is guaranteed to be empty, and you
 do
 * not have access to the grid, but you can move the robot using the given API Robot.
 *
 * You are tasked to use the robot to clean the entire room (i.e., clean every empty cell in
```

```
the
 * room). The robot with the four given APIs can move forward, turn left, or turn right. Each
turn
 * is 90 degrees.
 *
 * When the robot tries to move into a wall cell, its bumper sensor detects the obstacle, and
it
 * stays on the current cell.
 *
 * Design an algorithm to clean the entire room using the following APIs:
 *
 * interface Robot {
 *   // returns true if next cell is open and robot moves into the cell.
 *   // returns false if next cell is obstacle and robot stays on the current cell.
 *   boolean move();
 *
 *   // Robot will stay on the same cell after calling turnLeft/turnRight.
 *   // Each turn will be 90 degrees.
 *   void turnLeft();
 *   void turnRight();
 *
 *   // Clean the current cell.
 *   void clean();
 * }
 *
 * Note that the initial direction of the robot will be facing up. You can assume all four
edges of
 * the grid are all surrounded by a wall.
 *
 * Custom testing:
 * The input is only given to initialize the room and the robot's position internally. You
must
 * solve this problem "blindfolded". In other words, you must control the robot using only the
 * four mentioned APIs without knowing the room layout and the initial robot's position.
 */

/**
 * @param {Robot} robot
 * @return {void}
 */
var cleanRoom = function(robot) {
  const visited = new Set();
  const directions = [[-1, 0], [0, 1], [1, 0], [0, -1]];

    }
    const r = dp(index + 1, sum + nums[index]) + dp(index + 1, sum - nums[index]);
    map.set(key, r);
    return r;
  }

  return dp(0, 0);
};
```

0495 Teemo Attacking

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 495. Teemo Attacking
 * https://leetcode.com/problems/teemo-attacking/
 * Difficulty: Easy
 *
 * Our hero Teemo is attacking an enemy Ashe with poison attacks! When Teemo attacks Ashe,
Ashe gets
 * poisoned for a exactly duration seconds. More formally, an attack at second t will mean
Ashe is
 * poisoned during the inclusive time interval [t, t + duration - 1]. If Teemo attacks again
before
 * the poison effect ends, the timer for it is reset, and the poison effect will end duration
 * seconds after the new attack.
 *
 * You are given a non-decreasing integer array timeSeries, where timeSeries[i] denotes that
Teemo
```

```
 * attacks Ashe at second timeSeries[i], and an integer duration.
 *
 * Return the total number of seconds that Ashe is poisoned.
 */

/**
 * @param {number[]} timeSeries
 * @param {number} duration
 * @return {number}
 */
var findPoisonedDuration = function(timeSeries, duration) {
  return timeSeries.reduce((sum, n, i) => {
    return sum + Math.min(duration, (timeSeries[i + 1] ?? n + duration) - n);
  }, 0);
};
```

0496 Next Greater Element I

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 496. Next Greater Element I
 * https://leetcode.com/problems/next-greater-element-i/
 * Difficulty: Easy
 *
 * The next greater element of some element x in an array is the first greater element
 * that is to the right of x in the same array.
 *
 * You are given two distinct 0-indexed integer arrays nums1 and nums2, where nums1 is
 * a subset of nums2.
 *
 * For each 0 <= i < nums1.length, find the index j such that nums1[i] == nums2[j] and
 * determine the next greater element of nums2[j] in nums2. If there is no next greater
 * element, then the answer for this query is -1.
 *
 * Return an array ans of length nums1.length such that ans[i] is the next greater
 * element as described above.
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number[]}
 */
var nextGreaterElement = function(nums1, nums2) {
  return nums1.map(n => {
    let index = nums2.indexOf(n);
    while (nums2[index] <= n) {
      index++;
    }
    return index >= nums2.length ? -1 : nums2[index];
  });
};
```

0497 Random Point In Non Overlapping Rectangles

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 497. Random Point in Non-overlapping Rectangles
 * https://leetcode.com/problems/random-point-in-non-overlapping-rectangles/
 * Difficulty: Medium
 *
 * You are given an array of non-overlapping axis-aligned rectangles rects where
 * rects[i] = [ai, bi, xi, yi] indicates that (ai, bi) is the bottom-left corner point of the
```

```
 * ith rectangle and (xi, yi) is the top-right corner point of the ith rectangle. Design an
 * algorithm to pick a random integer point inside the space covered by one of the given
 * rectangles. A point on the perimeter of a rectangle is included in the space covered by
 * the rectangle.
 *
 * Any integer point inside the space covered by one of the given rectangles should be equally
 * likely to be returned.
 *
 * Note that an integer point is a point that has integer coordinates.
 *
 * Implement the Solution class:
 * - Solution(int[][] rects) Initializes the object with the given rectangles rects.
 * - int[] pick() Returns a random integer point [u, v] inside the space covered by one of the
 *   given rectangles.
 */

/**
 * @param {number[][]} rects
 */
var Solution = function(rects) {
  this.rects = rects;
  this.areas = rects.map(([x1, y1, x2, y2]) => (x2 - x1 + 1) * (y2 - y1 + 1));
  this.totalPoints = this.areas.reduce((sum, area) => sum + area, 0);
};

/**
 * @return {number[]}
 */
Solution.prototype.pick = function() {
  let random = Math.floor(Math.random() * this.totalPoints);

0510 Inorder Successor In Bst Ii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 510. Inorder Successor in BST II
 * https://leetcode.com/problems/inorder-successor-in-bst-ii/
 * Difficulty: Medium
 *
 * Given a node in a binary search tree, return the in-order successor of that node in the
BST.
 * If that node has no in-order successor, return null.
 *
```

```
 * The successor of a node is the node with the smallest key greater than node.val.
 *
 * You will have direct access to the node but not to the root of the tree. Each node will
have
 * a reference to its parent node. Below is the definition for Node:
 *
 * class Node {
 *     public int val;
 *     public Node left;
 *     public Node right;
 *     public Node parent;
 * }
 */

/**
 * // Definition for a _Node.
 * function _Node(val) {
 *    this.val = val;
 *    this.left = null;
 *    this.right = null;
 *    this.parent = null;
 * };
 */

/**
 * @param {_Node} node
 * @return {_Node}
 */
var inorderSuccessor = function(node) {
  if (node.right) {
    let successor = node.right;
    while (successor.left) {
      successor = successor.left;
    }
    return successor;
  }

  let current = node;
  while (current.parent && current.parent.right === current) {
    current = current.parent;
  }
  return current.parent;
};
```

0513 Find Bottom Left Tree Value

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 513. Find Bottom Left Tree Value
 * https://leetcode.com/problems/find-bottom-left-tree-value/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, return the leftmost value in the last row of the tree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number}
 */
var findBottomLeftValue = function(root) {
  const queue = [root];
```

```
  let result = root.val;

  while (queue.length) {
    const size = queue.length;
    result = queue[0].val;
    for (let i = 0; i < size; i++) {
      const node = queue.shift();
      if (node.left) queue.push(node.left);
      if (node.right) queue.push(node.right);
    }
  }

  return result;
};
```

0514 Freedom Trail

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 514. Freedom Trail
 * https://leetcode.com/problems/freedom-trail/
 * Difficulty: Hard
 *
 * In the video game Fallout 4, the quest "Road to Freedom" requires players to reach a metal
dial
 * called the "Freedom Trail Ring" and use the dial to spell a specific keyword to open the
door.
 *
 * Given a string ring that represents the code engraved on the outer ring and another string
key
 * that represents the keyword that needs to be spelled, return the minimum number of steps to
 spell
 * all the characters in the keyword.
 *
 * Initially, the first character of the ring is aligned at the "12:00" direction. You should
spell
 * all the characters in key one by one by rotating ring clockwise or anticlockwise to make
each
 * character of the string key aligned at the "12:00" direction and then by pressing the
center
 * button.
 *
 * At the stage of rotating the ring to spell the key character key[i]:
 * - You can rotate the ring clockwise or anticlockwise by one place, which counts as one
step.
 *   The final purpose of the rotation is to align one of ring's characters at the "12:00"
 *   direction, where this character must equal key[i].
 * - If the character key[i] has been aligned at the "12:00" direction, press the center
button
 *   to spell, which also counts as one step. After the pressing, you could begin to spell the
 *   next character in the key (next stage). Otherwise, you have finished all the spelling.
 */

/**
 * @param {string} ring
 * @param {string} key
 * @return {number}
 */
var findRotateSteps = function(ring, key) {
  const map = new Map();
  return dp(0, 0);

};
```

0517 Super Washing Machines

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 517. Super Washing Machines
 * https://leetcode.com/problems/super-washing-machines/
 * Difficulty: Hard
 *
 * You have n super washing machines on a line. Initially, each washing machine has some
 * dresses or is empty.
 *
 * For each move, you could choose any m (1 <= m <= n) washing machines, and pass one dress
 * of each washing machine to one of its adjacent washing machines at the same time.
 *
 * Given an integer array machines representing the number of dresses in each washing machine
 * from left to right on the line, return the minimum number of moves to make all the washing
 * machines have the same number of dresses. If it is not possible to do it, return -1.
 */

/**
 * @param {number[]} machines
 * @return {number}
 */
var findMinMoves = function(machines) {
  const total = machines.reduce((sum, num) => sum + num, 0);
  const target = total / machines.length;
  if (total % machines.length !== 0) return -1;

  let result = 0;
  for (let i = 0, balance = 0; i < machines.length; i++) {
    balance += machines[i] - target;
    result = Math.max(result, Math.abs(balance), machines[i] - target);
  }
  return result;
};
```

0518 Coin Change Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 518. Coin Change II
 * https://leetcode.com/problems/coin-change-ii/
 * Difficulty: Medium
 *
 * You are given an integer array coins representing coins of different denominations and
 * an integer amount representing a total amount of money.
 *
 * Return the number of combinations that make up that amount. If that amount of money
 * cannot be made up by any combination of the coins, return 0.
 *
 * You may assume that you have an infinite number of each kind of coin.
 *
 * The answer is guaranteed to fit into a signed 32-bit integer.
 */

/**
 * @param {number} amount
 * @param {number[]} coins
 * @return {number}
 */
var change = function(amount, coins) {
  const dp = new Array(amount + 1).fill(0);
  dp[0] = 1;

  for (const coin of coins) {
    for (let i = coin; i <= amount; i++) {

```

0519 Random Flip Matrix

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 519. Random Flip Matrix
 * https://leetcode.com/problems/random-flip-matrix/
 * Difficulty: Medium
 *
 * There is an m x n binary grid matrix with all the values set 0 initially. Design an
algorithm
 * to randomly pick an index (i, j) where matrix[i][j] == 0 and flips it to 1. All the indices
 * (i, j) where matrix[i][j] == 0 should be equally likely to be returned.
 *
 * Optimize your algorithm to minimize the number of calls made to the built-in random
function
 * of your language and optimize the time and space complexity.
 *
 * Implement the Solution class:
 * - Solution(int m, int n) Initializes the object with the size of the binary matrix m and n.
 * - int[] flip() Returns a random index [i, j] of the matrix where matrix[i][j] == 0 and
flips
 *   it to 1.
 * - void reset() Resets all the values of the matrix to be 0.
 */

/**
```

```
 * @param {number} m
 * @param {number} n
 */
var Solution = function(m, n) {
  this.m = m;
  this.n = n;
  this.total = m * n;
  this.flipped = new Map();

/**
 * @return {void}
 */
Solution.prototype.reset = function() {
  this.total = this.m * this.n;
  this.flipped.clear();
};
```

0520 Detect Capital

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 520. Detect Capital
 * https://leetcode.com/problems/detect-capital/
 * Difficulty: Easy
 *
 * We define the usage of capitals in a word to be right when one of the following
 * cases holds:
 * - All letters in this word are capitals, like "USA".
 * - All letters in this word are not capitals, like "leetcode".
 * - Only the first letter in this word is capital, like "Google".
 *
 * Given a string word, return true if the usage of capitals in it is right.
 */

/**
 * @param {string} word
 * @return {boolean}
 */
var detectCapitalUse = function(word) {
  return /^[A-Z]?[a-z]+$|^[A-Z]+$/.test(word);
};
```

0521 Longest Uncommon Subsequence I

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 521. Longest Uncommon Subsequence I
 * https://leetcode.com/problems/longest-uncommon-subsequence-i/
 * Difficulty: Easy
 *
 * Given two strings a and b, return the length of the longest uncommon subsequence between
 * a and b. If no such uncommon subsequence exists, return -1.
```

```
 *
 * An uncommon subsequence between two strings is a string that is a subsequence of exactly
 * one of them.
 */

/**
 * @param {string} a
 * @param {string} b
 * @return {number}
 */
var findLUSlength = function(a, b) {
  return a === b ? -1 : Math.max(a.length, b.length);
};
```

0522 Longest Uncommon Subsequence Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 522. Longest Uncommon Subsequence II
 * https://leetcode.com/problems/longest-uncommon-subsequence-ii/
 * Difficulty: Medium
 *
 * Given an array of strings strs, return the length of the longest uncommon subsequence
 * between them. If the longest uncommon subsequence does not exist, return -1.
 *
 * An uncommon subsequence between an array of strings is a string that is a subsequence
 * of one string but not the others.
 *
 * A subsequence of a string s is a string that can be obtained after deleting any number
 * of characters from s.
 *
 * For example, "abc" is a subsequence of "aebdc" because you can delete the underlined
 * characters in "aebdc" to get "abc". Other subsequences of "aebdc" include "aebdc",
 * "aeb", and "" (empty string).
 */

/**
 * @param {string[]} strs
 * @return {number}
 */

      count++;
      return;
    }
    for (let i = 1; i <= n; i++) {
      if (!(used & (1 << i)) && (i % offset === 0 || offset % i === 0)) {
        backtrack(offset + 1, used | (1 << i));
      }
    }
  }
};
```

0527 Word Abbreviation

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 527. Word Abbreviation
 * https://leetcode.com/problems/word-abbreviation/
 * Difficulty: Hard
 *
 * Given an array of distinct strings words, return the minimal possible abbreviations for
 * every word.
 *
 * The following are the rules for a string abbreviation:
 * 1. The initial abbreviation for each word is: the first character, then the number of
 *    characters in between, followed by the last character.
 * 2. If more than one word shares the same abbreviation, then perform the following
operation:
 *    - Increase the prefix (characters in the first part) of each of their abbreviations by
1.
 *      - For example, say you start with the words ["abcdef","abndef"] both initially
abbreviated
 *        as "a4f". Then, a sequence of operations would be
 *        ["a4f","a4f"] -> ["ab3f","ab3f"] -> ["abc2f","abn2f"].
 *   - This operation is repeated until every abbreviation is unique.
 * 3. At the end, if an abbreviation did not make a word shorter, then keep it as the original
 word.
 */

/**
 * @param {string[]} words
 * @return {string[]}
 */
var wordsAbbreviation = function(words) {
  const n = words.length;
  const result = new Array(n).fill('');

```

0528 Random Pick With Weight

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 528. Random Pick with Weight
 * https://leetcode.com/problems/random-pick-with-weight/
 * Difficulty: Medium
 *
 * You are given a 0-indexed array of positive integers w where w[i] describes the
 * weight of the ith index.
 *
 * You need to implement the function pickIndex(), which randomly picks an index in
 * the range [0, w.length - 1] (inclusive) and returns it. The probability of picking
 * an index i is w[i] / sum(w).
 *
 * For example, if w = [1, 3], the probability of picking index 0 is 1 / (1 + 3) = 0.25
 * (i.e., 25%), and the probability of picking index 1 is 3 / (1 + 3) = 0.75 (i.e., 75%).
 */

/**
 * @param {number[]} w
 */
var Solution = function(w) {
  this.sums = [];
  let sum = 0;
```

```
  for (const weight of w) {
    sum += weight;
    this.sums.push(sum);
  }
  this.total = sum;
};

/**
 * @return {number}
 */
Solution.prototype.pickIndex = function() {
  const target = Math.random() * this.total;
  let left = 0;
  let right = this.sums.length - 1;
  while (left < right) {
    const mid = Math.floor((left + right) / 2);
    if (this.sums[mid] <= target) {
      left = mid + 1;
    } else {
      right = mid;
    }
  }
  return left;
};
```

0529 Minesweeper

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 529. Minesweeper
 * https://leetcode.com/problems/minesweeper/
 * Difficulty: Medium
 *
 * Let's play the minesweeper game (Wikipedia, online game)!
 *
 * You are given an m x n char matrix board representing the game board where:
 * - 'M' represents an unrevealed mine,
 * - 'E' represents an unrevealed empty square,
 * - 'B' represents a revealed blank square that has no adjacent mines (i.e., above, below,
 *   left, right, and all 4 diagonals),
 * - digit ('1' to '8') represents how many mines are adjacent to this revealed square, and
 * - 'X' represents a revealed mine.
 *
 * You are also given an integer array click where click = [clickr, clickc] represents the
 * next click position among all the unrevealed squares ('M' or 'E').
 *
 * Return the board after revealing this position according to the following rules:
 * 1. If a mine 'M' is revealed, then the game is over. You should change it to 'X'.
 * 2. If an empty square 'E' with no adjacent mines is revealed, then change it to a revealed
 *    blank 'B' and all of its adjacent unrevealed squares should be revealed recursively.
 * 3. If an empty square 'E' with at least one adjacent mine is revealed, then change it to a
 *    digit ('1' to '8') representing the number of adjacent mines.
 * 4. Return the board when no more squares will be revealed.
 */

/**
 * @param {character[][]} board
 * @param {number[]} click
 * @return {character[][]}
 */
var updateBoard = function(board, click) {
  const [row, col] = click;
  const rows = board.length;

```

0535 Encode And Decode Tinyurl

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 535. Encode and Decode TinyURL
 * https://leetcode.com/problems/encode-and-decode-tinyurl/
 * Difficulty: Medium
 *
 * TinyURL is a URL shortening service where you enter a URL such as
 * https://leetcode.com/problems/design-tinyurl and it returns a short URL such as
 * http://tinyurl.com/4e9iAk. Design a class to encode a URL and decode a tiny URL.
 *
 * There is no restriction on how your encode/decode algorithm should work. You just
 * need to ensure that a URL can be encoded to a tiny URL and the tiny URL can be
 * decoded to the original URL.
 *
 * Implement the Solution class:
 * - Solution() Initializes the object of the system.
 * - String encode(String longUrl) Returns a tiny URL for the given longUrl.
 * - String decode(String shortUrl) Returns the original long URL for the given shortUrl.
 *   It is guaranteed that the given shortUrl was encoded by the same object.
 */

const map = new Map();
let counter = 1;

/**
 * Encodes a URL to a shortened URL.
 *
 * @param {string} longUrl
 * @return {string}
 */
var encode = function(longUrl) {
  const shortUrl = 'https://tinyurl.com/' + counter.toString();
  map.set(shortUrl, longUrl);
  counter++;
  return shortUrl;
};

 * Decodes a shortened URL to its original URL.
 *
 * @param {string} shortUrl
 * @return {string}
 */
var decode = function(shortUrl) {
  return map.get(shortUrl) || null;
```

```
};
```

0536 Construct Binary Tree From String

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 536. Construct Binary Tree from String
 * https://leetcode.com/problems/construct-binary-tree-from-string/
 * Difficulty: Medium
 *
 * You need to construct a binary tree from a string consisting of parenthesis and integers.
 *
 * The whole input represents a binary tree. It contains an integer followed by zero, one or
 * two pairs of parenthesis. The integer represents the root's value and a pair of parenthesis
 * contains a child binary tree with the same structure.
 *
 * You always start to construct the left child node of the parent first if it exists.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {string} s
 * @return {TreeNode}
 */
var str2tree = function(s) {
  if (!s) return null;
  let index = 0;
  return constructTree();

  function parseNumber() {
    const isNegative = s[index] === '-';
    if (isNegative) index++;

    let num = 0;
    while (index < s.length && /[0-9]/.test(s[index])) {
      num = num * 10 + parseInt(s[index]);
      index++;
    }

    return isNegative ? -num : num;
  }

  function constructTree() {
    if (index >= s.length) return null;

    const value = parseNumber();
    const node = new TreeNode(value);
    if (index < s.length && s[index] === '(') {
      index++;
      node.left = constructTree();

      index++;
    }

    return node;
  }
};
```

0537 Complex Number Multiplication

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 537. Complex Number Multiplication
 * https://leetcode.com/problems/complex-number-multiplication/
 * Difficulty: Medium
 *
 * A complex number can be represented as a string on the form "real+imaginaryi" where:
 * - real is the real part and is an integer in the range [-100, 100].
 * - imaginary is the imaginary part and is an integer in the range [-100, 100].
 * - i2 == -1.
 *
 * Given two complex numbers num1 and num2 as strings, return a string of the complex number
 * that represents their multiplications.
 */

/**
 * @param {string} num1
 * @param {string} num2
 * @return {string}
 */
var complexNumberMultiply = function(num1, num2) {
  const [r1, i1] = num1.split('+').map(n => parseInt(n.replace('i', '')));
  const [r2, i2] = num2.split('+').map(n => parseInt(n.replace('i', '')));
  return `${r1 * r2 - i1 * i2}+${r1 * i2 + r2 * i1}i`;
};
```

0538 Convert Bst To Greater Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 538. Convert BST to Greater Tree
 * https://leetcode.com/problems/convert-bst-to-greater-tree/
 * Difficulty: Medium
 *
 * Given the root of a Binary Search Tree (BST), convert it to a Greater Tree such that every
 * key of the original BST is changed to the original key plus the sum of all keys greater
 * than the original key in BST.
 *
 * As a reminder, a binary search tree is a tree that satisfies these constraints:
 * - The left subtree of a node contains only nodes with keys less than the node's key.
 * - The right subtree of a node contains only nodes with keys greater than the node's key.
 * - Both the left and right subtrees must also be binary search trees.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {TreeNode}
 */
var convertBST = function(root) {
  let sum = 0;
  traverse(root);
  return root;
```

```

    return Math.max(left, right) + 1;
  }
};
```

0544 Output Contest Matches

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 544. Output Contest Matches
 * https://leetcode.com/problems/output-contest-matches/
 * Difficulty: Medium
 *
 * During the NBA playoffs, we always set the rather strong team to play with the rather weak
 * team, like making the rank 1 team play with the rank nth team, which is a good strategy to
 * make the contest more interesting.
 *
 * Given n teams, return their final contest matches in the form of a string.
 *
 * The n teams are labeled from 1 to n, which represents their initial rank (i.e., Rank 1 is
 * the strongest team and Rank n is the weakest team).
 *
 * We will use parentheses '(', and ')' and commas ',' to represent the contest team pairing.
 * We use the parentheses for pairing and the commas for partition. During the pairing process
 * in each round, you always need to follow the strategy of making the rather strong one pair
 * with the rather weak one.
 */

/**
 * @param {number} n
 * @return {string}
 */
var findContestMatch = function(n) {
  const teams = Array.from({ length: n }, (_, i) => (i + 1).toString());

    if (arr.length === 1) return arr[0];

    const nextRound = [];
    for (let i = 0; i < arr.length / 2; i++) {
      nextRound.push(`(${arr[i]},${arr[arr.length - 1 - i]})`);
    }

    return pairTeams(nextRound);
  }
};
```

0545 Boundary Of Binary Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 545. Boundary of Binary Tree
 * https://leetcode.com/problems/boundary-of-binary-tree/
 * Difficulty: Medium
 *
 * The boundary of a binary tree is the concatenation of the root, the left boundary, the
leaves
 * ordered from left-to-right, and the reverse order of the right boundary.
 *
 * The left boundary is the set of nodes defined by the following:
 * - The root node's left child is in the left boundary. If the root does not have a left
child,
 *   then the left boundary is empty.
 * - If a node in the left boundary and has a left child, then the left child is in the left
 *   boundary.
 * - If a node is in the left boundary, has no left child, but has a right child, then the
right
```

```
 *   child is in the left boundary.
 * - The leftmost leaf is not in the left boundary.
 *
 * The right boundary is similar to the left boundary, except it is the right side of the
root's
 * right subtree. Again, the leaf is not part of the right boundary, and the right boundary is
 * empty if the root does not have a right child.
 *
 * The leaves are nodes that do not have any children. For this problem, the root is not a
leaf.
 *
 * Given the root of a binary tree, return the values of its boundary.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)

      }
    }
    return dp[l][r][k] = max;
  }
};
```

0547 Number Of Provinces

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 547. Number of Provinces
 * https://leetcode.com/problems/number-of-provinces/
 * Difficulty: Medium
 *
 * There are n cities. Some of them are connected, while some are not. If city a is connected
 * directly with city b, and city b is connected directly with city c, then city a is
connected
 * indirectly with city c.
 *
 * A province is a group of directly or indirectly connected cities and no other cities
```

```
outside
 * of the group.
 *
 * You are given an n x n matrix isConnected where isConnected[i][j] = 1 if the ith city and
the
 * jth city are directly connected, and isConnected[i][j] = 0 otherwise.

Return the total number of provinces.
 */

/**
 * @param {number[][]} isConnected
 * @return {number}
 */
var findCircleNum = function(isConnected) {
  const seen = new Array(isConnected.length).fill(0);
  let result = 0;

  function dfs(node) {
    seen[node] = 1;
    for (let i = 0; i < isConnected.length; i++) {
      if (isConnected[node][i] === 1 && !seen[i]) {
        dfs(i);
      }
    }
  }

  for (let i = 0; i < isConnected.length; i++) {
    if (!seen[i]) {
      result++;
      dfs(i);
    }
  }

  return result;
};
```

0548 Split Array With Equal Sum

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 548. Split Array with Equal Sum
 * https://leetcode.com/problems/split-array-with-equal-sum/
 * Difficulty: Hard
 *
 * Given an integer array nums of length n, return true if there is a triplet (i, j, k) which
 * satisfies the following conditions:
 * - 0 < i, i + 1 < j, j + 1 < k < n - 1
 * - The sum of subarrays (0, i - 1), (i + 1, j - 1), (j + 1, k - 1) and (k + 1, n - 1) is
equal.
 *
 * A subarray (l, r) represents a slice of the original array starting from the element
 * indexed l to the element indexed r.
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */
var splitArray = function(nums) {
  const length = nums.length;
  if (length < 7) return false;

  const prefixSums = new Array(length + 1).fill(0);
  for (let i = 0; i < length; i++) {
    prefixSums[i + 1] = prefixSums[i] + nums[i];
  }

  const getSum = (start, end) => prefixSums[end + 1] - prefixSums[start];
```

```
  for (let j = 3; j < length - 3; j++) {
    const seenSums = new Set();
    for (let i = 1; i < j - 1; i++) {
      const firstSum = getSum(0, i - 1);
      const secondSum = getSum(i + 1, j - 1);

        return true;
      }
    }
  }
  return false;
};
```

0549 Binary Tree Longest Consecutive Sequence Ii

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 549. Binary Tree Longest Consecutive Sequence II
 * https://leetcode.com/problems/binary-tree-longest-consecutive-sequence-ii/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, return the length of the longest consecutive path in the
tree.
 *
 * A consecutive path is a path where the values of the consecutive nodes in the path differ
by one.
 * This path can be either increasing or decreasing.
 * - For example, [1,2,3,4] and [4,3,2,1] are both considered valid, but the path [1,2,4,3] is
 *   not valid.
 *
 * On the other hand, the path can be in the child-Parent-child order, where not necessarily
be
 * parent-child order.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */

```

0551 Student Attendance Record I

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 551. Student Attendance Record I
 * https://leetcode.com/problems/student-attendance-record-i/
 * Difficulty: Easy
 *
 * You are given a string s representing an attendance record for a student
 * where each character signifies whether the student was absent, late, or
 * present on that day. The record only contains the following three characters:
 * - 'A': Absent.
 * - 'L': Late.
 * - 'P': Present.
 *
 * The student is eligible for an attendance award if they meet both of the following
criteria:
 * - The student was absent ('A') for strictly fewer than 2 days total.
 * - The student was never late ('L') for 3 or more consecutive days.
 *
 * Return true if the student is eligible for an attendance award, or false otherwise.
 */

/**
 * @param {string} s
 * @return {boolean}
 */
var checkRecord = function(s) {
  return !s.includes('LLL') && (s.indexOf('A') === s.lastIndexOf('A'));
};
```

0552 Student Attendance Record Ii

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 552. Student Attendance Record II
 * https://leetcode.com/problems/student-attendance-record-ii/
 * Difficulty: Hard
 *
 * An attendance record for a student can be represented as a string where each character
 * signifies whether the student was absent, late, or present on that day. The record only
 * contains the following three characters:
 * - 'A': Absent.
```

```
 * - 'L': Late.
 * - 'P': Present.
 *
 * Any student is eligible for an attendance award if they meet both of the following
 * criteria:
 * - The student was absent ('A') for strictly fewer than 2 days total.
 * - The student was never late ('L') for 3 or more consecutive days.
 *
 * Given an integer n, return the number of possible attendance records of length n that make
 * a student eligible for an attendance award. The answer may be very large, so return it
 * modulo 109 + 7.
 */

/**
 * @param {number} n
 * @return {number}
 */
var checkRecord = function(n) {
  const MOD = 1e9 + 7;
  const dp = [[1, 0, 0], [0, 0, 0]];

  for (let i = 0; i < n; i++) {
    const m = dp.map(row => [...row]);
    dp[0][0] = (m[0][0] + m[0][1] + m[0][2]) % MOD;
    dp[0][1] = m[0][0];
    dp[0][2] = m[0][1];
    dp[1][0] = (m[0][0] + m[0][1] + m[0][2] + m[1][0] + m[1][1] + m[1][2]) % MOD;
    dp[1][1] = m[1][0];
    dp[1][2] = m[1][1];
  }

  return (dp[0][0] + dp[0][1] + dp[0][2] + dp[1][0] + dp[1][1] + dp[1][2]) % MOD;
};
```

0553 Optimal Division

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 553. Optimal Division
 * https://leetcode.com/problems/optimal-division/
 * Difficulty: Medium
 *
 * You are given an integer array nums. The adjacent integers in nums will perform
 * the float division.
 * - For example, for nums = [2,3,4], we will evaluate the expression "2/3/4".
 *
 * However, you can add any number of parenthesis at any position to change the priority
 * of operations. You want to add these parentheses such the value of the expression after
 * the evaluation is maximum.
 *
 * Return the corresponding expression that has the maximum value in string format.
 *
 * Note: your expression should not contain redundant parenthesis.
 */

/**
 * @param {number[]} nums
 * @return {string}
 */
var optimalDivision = function(nums) {
  if (nums.length === 1) return nums[0].toString();
  if (nums.length === 2) return `${nums[0]}/${nums[1]}`;
  return `${nums[0]}/(${nums.slice(1).join('/')})`;
};
```

0554 Brick Wall

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 554. Brick Wall
 * https://leetcode.com/problems/brick-wall/
 * Difficulty: Medium
 *
 * There is a rectangular brick wall in front of you with n rows of bricks. The ith row has
 * some number of bricks each of the same height (i.e., one unit) but they can be of different
 * widths. The total width of each row is the same.
 *
 * Draw a vertical line from the top to the bottom and cross the least bricks. If your line
 * goes through the edge of a brick, then the brick is not considered as crossed. You cannot
 * draw a line just along one of the two vertical edges of the wall, in which case the line
 * will obviously cross no bricks.
 *
 * Given the 2D array wall that contains the information about the wall, return the minimum
 * number of crossed bricks after drawing such a vertical line.
 */

/**
 * @param {number[][]} wall
 * @return {number}
 */
var leastBricks = function(wall) {
  const map = new Map();
  let max = 0;

  for (const row of wall) {
    for (let i = 0, sum = 0; i < row.length - 1; i++) {
      sum += row[i];
      map.set(sum, (map.get(sum) || 0) + 1);
      max = Math.max(max, map.get(sum));
    }
  }

  return wall.length - max;
};
```

0555 Split Concatenated Strings

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 555. Split Concatenated Strings
 * https://leetcode.com/problems/split-concatenated-strings/
 * Difficulty: Medium
 *
 * You are given an array of strings strs. You could concatenate these strings together into a
 * loop, where for each string, you could choose to reverse it or not. Among all the possible
loops
 *
 * Return the lexicographically largest string after cutting the loop, which will make the
looped
 * string into a regular one.
 *
 *
 * Specifically, to find the lexicographically largest string, you need to experience two
phases:
 * 1. Concatenate all the strings into a loop, where you can reverse some strings or not and
connect
 *    them in the same order as given.
 * 2. Cut and make one breakpoint in any place of the loop, which will make the looped string
```

```
into
 *    a regular one starting from the character at the cutpoint.
 *
 * And your job is to find the lexicographically largest one among all the possible regular
strings.
 */

/**
 * @param {string[]} strs
 * @return {string}
 */
var splitLoopedString = function(strs) {
  const normalized = strs.map(str => {
    const reversed = str.split('').reverse().join('');
    return str > reversed ? str : reversed;
  });

  let result = '';
  for (let i = 0; i < normalized.length; i++) {
    const current = normalized[i];
    const prefix = normalized.slice(i + 1).join('') + normalized.slice(0, i).join('');
    const original = current;
    const reversed = current.split('').reverse().join('');

    for (const str of [original, reversed]) {
      for (let j = 0; j <= str.length; j++) {
        const candidate = str.slice(j) + prefix + str.slice(0, j);
        if (candidate > result) {
          result = candidate;
        }
      }
    }
  }

  return result;
};
```

0556 Next Greater Element Iii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 556. Next Greater Element III
 * https://leetcode.com/problems/next-greater-element-iii/
 * Difficulty: Medium
 *
 * Given a positive integer n, find the smallest integer which has exactly the same digits
existing
 * in the integer n and is greater in value than n. If no such positive integer exists, return
 -1.
 *
 * Note that the returned integer should fit in 32-bit integer, if there is a valid answer but
 it
 * does not fit in 32-bit integer, return -1.
 */

/**
 * @param {number} n
 * @return {number}
 */
var nextGreaterElement = function(n) {
  const digits = [...String(n)];
  let i = digits.length - 2;

  while (i >= 0 && digits[i] >= digits[i + 1]) i--;
  if (i < 0) return -1;

  let j = digits.length - 1;
  while (j >= 0 && digits[j] <= digits[i]) j--;
```

```
  [digits[i], digits[j]] = [digits[j], digits[i]];
  let left = i + 1;
  let right = digits.length - 1;
  while (left < right) {
    [digits[left], digits[right]] = [digits[right], digits[left]];
    left++;
    right--;
  }

  const result = +digits.join('');
  return result > n && result <= 2**31 - 1 ? result : -1;
};
```

0557 Reverse Words In A String Iii

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 557. Reverse Words in a String III
 * https://leetcode.com/problems/reverse-words-in-a-string-iii/
 * Difficulty: Easy
 *
 * Given a string s, reverse the order of characters in each word within a sentence while
 * still preserving whitespace and initial word order.
 */

/**
 * @param {string} str
 * @return {string}
 */
var reverseWords = function(str) {
  return str.split(/\s/).map(s => s.split('').reverse().join('')).join(' ');
};
```

0558 Logical Or Of Two Binary Grids Represented As Quad Trees

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 558. Logical OR of Two Binary Grids Represented as Quad-Trees
 * https://leetcode.com/problems/logical-or-of-two-binary-grids-represented-as-quad-trees/
 * Difficulty: Medium
 *
 * A Binary Matrix is a matrix in which all the elements are either 0 or 1.
 *
 * Given quadTree1 and quadTree2. quadTree1 represents a n * n binary matrix and quadTree2
 * represents another n * n binary matrix.
 *
 * Return a Quad-Tree representing the n * n binary matrix which is the result of logical
 * bitwise OR of the two binary matrixes represented by quadTree1 and quadTree2.
 *
 * Notice that you can assign the value of a node to True or False when isLeaf is False, and
 * both are accepted in the answer.
 *
 * A Quad-Tree is a tree data structure in which each internal node has exactly four children.
 * Besides, each node has two attributes:
 * - val: True if the node represents a grid of 1's or False if the node represents a grid of
0's.
 * - isLeaf: True if the node is leaf node on the tree or False if the node has the four
children.
 * class Node {
 *     public boolean val;
 *     public boolean isLeaf;
 *     public Node topLeft;
 *     public Node topRight;
```

```
 *     public Node bottomLeft;
 *     public Node bottomRight;
 * }.
 *
 * We can construct a Quad-Tree from a two-dimensional area using the following steps:
 * 1. If the current grid has the same value (i.e all 1's or all 0's) set isLeaf True and set
val to
 *    the value of the grid and set the four children to Null and stop.
 * 2. If the current grid has different values, set isLeaf to False and set val to any value
and
 *    divide the current grid into four sub-grids as shown in the photo.
 * 3. Recurse for each of the children with the proper sub-grid.
 */

/**
 * // Definition for a QuadTree node.
 * function _Node(val,isLeaf,topLeft,topRight,bottomLeft,bottomRight) {
 *    this.val = val;
 *    this.isLeaf = isLeaf;
 *    this.topLeft = topLeft;
 *    this.topRight = topRight;
 *    this.bottomLeft = bottomLeft;
 *    this.bottomRight = bottomRight;
 * };
 */

/**
 * @param {_Node} quadTree1
 * @param {_Node} quadTree2
 * @return {_Node}
 */
var intersect = function(quadTree1, quadTree2) {
  if (quadTree1.isLeaf) return quadTree1.val ? quadTree1 : quadTree2;
  if (quadTree2.isLeaf) return quadTree2.val ? quadTree2 : quadTree1;

  const topLeft = intersect(quadTree1.topLeft, quadTree2.topLeft);
  const topRight = intersect(quadTree1.topRight, quadTree2.topRight);
  const bottomLeft = intersect(quadTree1.bottomLeft, quadTree2.bottomLeft);
  const bottomRight = intersect(quadTree1.bottomRight, quadTree2.bottomRight);

  if (topLeft.isLeaf && topRight.isLeaf && bottomLeft.isLeaf && bottomRight.isLeaf
      && topLeft.val === topRight.val && topRight.val === bottomLeft.val
      && bottomLeft.val === bottomRight.val) {
    return new _Node(topLeft.val, true, null, null, null, null);
  }

  return new _Node(false, false, topLeft, topRight, bottomLeft, bottomRight);
};
```

0559 Maximum Depth Of N Ary Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 559. Maximum Depth of N-ary Tree
 * https://leetcode.com/problems/maximum-depth-of-n-ary-tree/
 * Difficulty: Easy
 *
 * Given a n-ary tree, find its maximum depth.
 *
 * The maximum depth is the number of nodes along the longest path from the root node down to
 * the farthest leaf node.
 *
 * Nary-Tree input serialization is represented in their level order traversal, each group of
 * children is separated by the null value (See examples).
 */

/**
 * // Definition for a _Node.
 * function _Node(val,children) {
```

```
 *    this.val = val === undefined ? null : val;
 *    this.children = children === undefined ? null : children;
 * };
 */

/**
 * @param {_Node|null} root
 * @return {number}
 */
var maxDepth = function(root) {
  if (!root) return 0;

    map.set(count, (map.get(count) ?? 0) + 1);
  }

  return result;
};
```

0561 Array Partition

EASY

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 561. Array Partition
 * https://leetcode.com/problems/array-partition/
 * Difficulty: Easy
 *
 * Given an integer array nums of 2n integers, group these integers into n pairs (a1, b1),
 * (a2, b2), ..., (an, bn) such that the sum of min(ai, bi) for all i is maximized.
 * Return the maximized sum.
 */

/**
 * @param {number[]} nums
 * @return {number}
```

```
 */
var arrayPairSum = function(nums) {
  return nums.sort((a, b) => a - b).reduce((sum, v, i, a) =>
    sum + (i % 2 === 0 ? Math.min(v, a[i + 1]) : 0), 0);
};
```

0562 Longest Line Of Consecutive One In Matrix

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 562. Longest Line of Consecutive One in Matrix
 * https://leetcode.com/problems/longest-line-of-consecutive-one-in-matrix/
 * Difficulty: Medium
 *
 * Given an m x n binary matrix mat, return the length of the longest line of consecutive one
 * in the matrix.
 *
 * The line could be horizontal, vertical, diagonal, or anti-diagonal.
 */

/**
 * @param {number[][]} mat
 * @return {number}
 */
var longestLine = function(mat) {
  const rows = mat.length;
  const cols = mat[0].length;
  const dp = new Array(rows).fill().map(() => new Array(cols).fill().map(() => [0, 0, 0, 0]));
  let maxLength = 0;

  for (let i = 0; i < rows; i++) {
    for (let j = 0; j < cols; j++) {
      if (mat[i][j] === 1) {
        dp[i][j][0] = j > 0 ? dp[i][j - 1][0] + 1 : 1;

        dp[i][j][2] = (i > 0 && j > 0) ? dp[i - 1][j - 1][2] + 1 : 1;
        dp[i][j][3] = (i > 0 && j < cols - 1) ? dp[i - 1][j + 1][3] + 1 : 1;
        maxLength = Math.max(maxLength, ...dp[i][j]);
      }
    }
  }

  return maxLength;
};
```

0563 Binary Tree Tilt

EASY

APPROACH NOTES

Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 563. Binary Tree Tilt
 * https://leetcode.com/problems/binary-tree-tilt/
 * Difficulty: Easy
 *
 * Given the root of a binary tree, return the sum of every tree node's tilt.
 *
 * The tilt of a tree node is the absolute difference between the sum of all
 * left subtree node values and all right subtree node values. If a node does
 * not have a left child, then the sum of the left subtree node values is
 * treated as 0. The rule is similar if the node does not have a right child.
 */

/**
 * Definition for a binary tree node.
```

```
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {number}
 */
var findTilt = function(root) {

      history.add(j);
      count++;
    }
    max = Math.max(max, count);
  }
  return max;
};
```

0566 Reshape The Matrix

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 566. Reshape the Matrix
 * https://leetcode.com/problems/reshape-the-matrix/
 * Difficulty: Easy
 *
 * In MATLAB, there is a handy function called reshape which can reshape an m x n
 * matrix into a new one with a different size r x c keeping its original data.
 *
 * You are given an m x n matrix mat and two integers r and c representing the
 * number of rows and the number of columns of the wanted reshaped matrix.
 *
```

```
 * The reshaped matrix should be filled with all the elements of the original
 * matrix in the same row-traversing order as they were.
 *
 * If the reshape operation with given parameters is possible and legal, output
 * the new reshaped matrix; Otherwise, output the original matrix.
 */

/**
 * @param {number[][]} mat
 * @param {number} r
 * @param {number} c
 * @return {number[][]}
 */
var matrixReshape = function(mat, r, c) {
  const flat = mat.flat();
  const result = [];

  if (flat.length !== r * c) {
    return mat;
  }

  while (flat.length) {
    result.push(flat.splice(0, c));
  }

  return result;
};
```

0567 Permutation In String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 567. Permutation in String
 * https://leetcode.com/problems/permutation-in-string/
 * Difficulty: Medium
 *
 * Given two strings s1 and s2, return true if s2 contains a permutation of s1, or false
otherwise.
 *
 * In other words, return true if one of s1's permutations is the substring of s2.
 */

/**
 * @param {string} s1
 * @param {string} s2
 * @return {boolean}
 */
var checkInclusion = function(s1, s2) {
  const getCharCode = c => c.charCodeAt() - 'a'.charCodeAt();
  const isMatch = (a1, a2) => a1.every((n, i) => a2[i] === n);

    return false;
  }

  const map1 = new Array(26).fill(0);
  const map2 = new Array(26).fill(0);
  for (let i = 0; i < s1.length; i++) {
    map1[getCharCode(s1[i])]++;
    map2[getCharCode(s2[i])]++;
  }

  for (let i = 0; i < s2.length - s1.length; i++) {
    if (isMatch(map1, map2)) return true;
    map2[getCharCode(s2[i + s1.length])]++;
    map2[getCharCode(s2[i])]--;
  }

  return isMatch(map1, map2);
```

```
};
```

0568 Maximum Vacation Days

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 568. Maximum Vacation Days
 * https://leetcode.com/problems/maximum-vacation-days/
 * Difficulty: Hard
 *
 * LeetCode wants to give one of its best employees the option to travel among n cities to
collect
 * algorithm problems. But all work and no play makes Jack a dull boy, you could take
vacations in
 * some particular cities and weeks. Your job is to schedule the traveling to maximize the
number
 * of vacation days you could take, but there are certain rules and restrictions you need to
follow.
 *
 * Rules and restrictions:
 * 1. You can only travel among n cities, represented by indexes from 0 to n - 1. Initially,
you
 *    are in the city indexed 0 on Monday.
 * 2. The cities are connected by flights. The flights are represented as an n x n matrix (not
 *    necessarily symmetrical), called flights representing the airline status from the city i
 to
 *    the city j. If there is no flight from the city i to the city j, flights[i][j] == 0;
 *    Otherwise, flights[i][j] == 1. Also, flights[i][i] == 0 for all i.
 * 3. You totally have k weeks (each week has seven days) to travel. You can only take flights
 at
 *    most once per day and can only take flights on each week's Monday morning. Since flight
time
 *    is so short, we do not consider the impact of flight time.
 * 4. For each city, you can only have restricted vacation days in different weeks, given an n
 x k
 *    matrix called days representing this relationship. For the value of days[i][j], it
represents
 *    the maximum days you could take a vacation in the city i in the week j.
 * 5. You could stay in a city beyond the number of vacation days, but you should work on the
extra
 *    days, which will not be counted as vacation days.
 * 6. If you fly from city A to city B and take the vacation on that day, the deduction
towards
 *    vacation days will count towards the vacation days of city B in that week.
 * 7. We do not consider the impact of flight hours on the calculation of vacation days.
 *
 * Given the two matrices flights and days, return the maximum vacation days you could take
during
 * k weeks.
 */

/**
 * @param {number[][]} flights
 * @param {number[][]} days
 * @return {number}
 */
var maxVacationDays = function(flights, days) {
  const cities = flights.length;
  const weeks = days[0].length;
  const dp = new Array(weeks + 1).fill().map(() => new Array(cities).fill(-Infinity));

  dp[0][0] = 0;

  for (let week = 1; week <= weeks; week++) {
    for (let currCity = 0; currCity < cities; currCity++) {
      for (let prevCity = 0; prevCity < cities; prevCity++) {
        if (dp[week - 1][prevCity] !== -Infinity
            && (flights[prevCity][currCity] || prevCity === currCity)) {
          dp[week][currCity] = Math.max(
```

```
            dp[week][currCity],
            dp[week - 1][prevCity] + days[currCity][week - 1]
          );
        }
      }
    }
  }

  return Math.max(0, ...dp[weeks]);
};
```

0572 Subtree Of Another Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 572. Subtree of Another Tree
 * https://leetcode.com/problems/subtree-of-another-tree/
 * Difficulty: Easy
 *
 * Given the roots of two binary trees root and subRoot, return true if there is a subtree of
 * root with the same structure and node values of subRoot and false otherwise.
 *
 * A subtree of a binary tree tree is a tree that consists of a node in tree and all of this
 * node's descendants. The tree tree could also be considered as a subtree of itself.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {TreeNode} subRoot
 * @return {boolean}
 */
var isSubtree = function(root, subRoot) {
  return traverse(root).includes(traverse(subRoot));

    return !node ? '#' : `,${node.val},${traverse(node.left)},${traverse(node.right)}`;
  }
};
```

0573 Squirrel Simulation

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 573. Squirrel Simulation
 * https://leetcode.com/problems/squirrel-simulation/
 * Difficulty: Medium
 *
 * You are given two integers height and width representing a garden of size height x width.
 * You are also given:
 * - an array tree where tree = [treer, treec] is the position of the tree in the garden,
 * - an array squirrel where squirrel = [squirrelr, squirrelc] is the position of the squirrel
 *   in the garden,
 * - and an array nuts where nuts[i] = [nutir, nutic] is the position of the ith nut in the
garden.
 *
 * The squirrel can only take at most one nut at one time and can move in four directions: up,
```

```
 down,
 * left, and right, to the adjacent cell.
 *
 * Return the minimal distance for the squirrel to collect all the nuts and put them under the
 tree
 * one by one.
 *
 * The distance is the number of moves.
 */

/**
 * @param {number} height
 * @param {number} width
 * @param {number[]} tree
 * @param {number[]} squirrel
 * @param {number[][]} nuts
 * @return {number}
 */
var minDistance = function(height, width, tree, squirrel, nuts) {
  const helper = (p1, p2) => Math.abs(p1[0] - p2[0]) + Math.abs(p1[1] - p2[1]);

  let totalDistance = 0;
  let maxSaving = -Infinity;

  for (const nut of nuts) {
    const nutToTree = helper(nut, tree);
    totalDistance += 2 * nutToTree;
    const squirrelToNut = helper(squirrel, nut);
    maxSaving = Math.max(maxSaving, nutToTree - squirrelToNut);
  }

  return totalDistance - maxSaving;
};
```

0575 Distribute Candies

EASY

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 575. Distribute Candies
 * https://leetcode.com/problems/distribute-candies/
 * Difficulty: Easy
 *
 * Alice has n candies, where the ith candy is of type candyType[i]. Alice noticed that
 * she started to gain weight, so she visited a doctor.
 *
 * The doctor advised Alice to only eat n / 2 of the candies she has (n is always even).
 * Alice likes her candies very much, and she wants to eat the maximum number of different
 * types of candies while still following the doctor's advice.
 *
 * Given the integer array candyType of length n, return the maximum number of different
 * types of candies she can eat if she only eats n / 2 of them.
 */

/**
 * @param {number[]} candyType
 * @return {number}
 */
var distributeCandies = function(candyType) {
  return Math.min(new Set(candyType).size, candyType.length / 2);
};
```

0576 Out Of Boundary Paths

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 576. Out of Boundary Paths
 * https://leetcode.com/problems/out-of-boundary-paths/
 * Difficulty: Medium
 *
 * There is an m x n grid with a ball. The ball is initially at the position [startRow,
 * startColumn]. You are allowed to move the ball to one of the four adjacent cells in
 * the grid (possibly out of the grid crossing the grid boundary). You can apply at most
 * maxMove moves to the ball.
 *
 * Given the five integers m, n, maxMove, startRow, startColumn, return the number of
 * paths to move the ball out of the grid boundary. Since the answer can be very large,
 * return it modulo 109 + 7.
 */

```

0591 Tag Validator

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 591. Tag Validator
 * https://leetcode.com/problems/tag-validator/
 * Difficulty: Hard
 *
 * Given a string representing a code snippet, implement a tag validator to parse the code and
 * return whether it is valid.
 *
 * A code snippet is valid if all the following rules hold:
 * 1. The code must be wrapped in a valid closed tag. Otherwise, the code is invalid.
 * 2. A closed tag (not necessarily valid) has exactly the following format:
 *    <TAG_NAME>TAG_CONTENT</TAG_NAME>. Among them, <TAG_NAME> is the start tag, and
</TAG_NAME>
 *    is the end tag. The TAG_NAME in start and end tags should be the same. A closed tag is
valid
 *    if and only if the TAG_NAME and TAG_CONTENT are valid.
 * 3. A valid TAG_NAME only contain upper-case letters, and has length in range [1,9].
Otherwise,
 *    the TAG_NAME is invalid.
 * 4. A valid TAG_CONTENT may contain other valid closed tags, cdata and any characters (see
 *    note1) EXCEPT unmatched <, unmatched start and end tag, and unmatched or closed tags
with
 *    invalid TAG_NAME. Otherwise, the TAG_CONTENT is invalid.
 * 5. A start tag is unmatched if no end tag exists with the same TAG_NAME, and vice versa.
 *    However, you also need to consider the issue of unbalanced when tags are nested.
 * 6. A < is unmatched if you cannot find a subsequent >. And when you find a < or </, all
 *    the subsequent characters until the next > should be parsed as TAG_NAME (not necessarily
 *    valid).
 * 7. The cdata has the following format : <![CDATA[CDATA_CONTENT]]>. The range of
CDATA_CONTENT
 *    is defined as the characters between <![CDATA[ and the first subsequent ]]>.
 * 8. CDATA_CONTENT may contain any characters. The function of cdata is to forbid the
validator
 *    to parse CDATA_CONTENT, so even it has some characters that can be parsed as tag (no
matter
 *    valid or invalid), you should treat it as regular characters.
 */

/**
 * @param {string} code
 * @return {boolean}
 */

        return false;
      }
      set.add(d);
    }
  }

  return set.size === 2;
};
```

0594 Longest Harmonious Subsequence

EASY

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 594. Longest Harmonious Subsequence
 * https://leetcode.com/problems/longest-harmonious-subsequence/
 * Difficulty: Easy
 *
 * We define a harmonious array as an array where the difference between its maximum
 * value and its minimum value is exactly 1.
 *
 * Given an integer array nums, return the length of its longest harmonious subsequence
 * among all its possible subsequences.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var findLHS = function(nums) {
  const map = new Map();
  nums.forEach(n => map.set(n, (map.get(n) ?? 0) + 1));

  return Array.from(map).reduce((result, [n, count]) => {
    return map.has(n + 1) ? Math.max(result, count + map.get(n + 1)) : result;
  }, 0);
};
```

0598 Range Addition Ii

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 598. Range Addition II
```

```
 * https://leetcode.com/problems/range-addition-ii/
 * Difficulty: Easy
 *
 * You are given an m x n matrix M initialized with all 0's and an array of operations ops,
 * where ops[i] = [ai, bi] means M[x][y] should be incremented by one for all 0 <= x < ai
 * and 0 <= y < bi.
 *
 * Count and return the number of maximum integers in the matrix after performing all the
 * operations.
 */

/**
 * @param {number} m
 * @param {number} n
 * @param {number[][]} ops
 * @return {number}
 */
var maxCount = function(m, n, ops) {
  let a = m;

    } else {
      previous = 0;
    }
  }

  return result + 1;
};
```

0604 Design Compressed String Iterator

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 604. Design Compressed String Iterator
 * https://leetcode.com/problems/design-compressed-string-iterator/
 * Difficulty: Easy
 *
 * Design and implement a data structure for a compressed string iterator. The given
compressed
 * string will be in the form of each letter followed by a positive integer representing the
 * number of this letter existing in the original uncompressed string.
 *
 * Implement the StringIterator class:
 * - next() Returns the next character if the original string still has uncompressed
characters,
 *   otherwise returns a white space.
 * - hasNext() Returns true if there is any letter needs to be uncompressed in the original
string,
 *   otherwise returns false.
 */

/**
 * @param {string} compressedString
 */
var StringIterator = function(compressedString) {
  this.segments = [];
  this.currentIndex = 0;
```

```
  this.currentCount = 0;

  let i = 0;
  while (i < compressedString.length) {
    const character = compressedString[i];
    i++;
    let count = '';
    while (i < compressedString.length && /\d/.test(compressedString[i])) {
      count += compressedString[i];
      i++;
    }
    this.segments.push([character, parseInt(count)]);
  }
};

/**

    return ' ';
  }

  if (this.currentCount === 0) {
    this.currentCount = this.segments[this.currentIndex][1];
  }

  const character = this.segments[this.currentIndex][0];
  this.currentCount--;

  if (this.currentCount === 0) {
    this.currentIndex++;
  }

  return character;
};

/**
 * @return {boolean}
 */
StringIterator.prototype.hasNext = function() {
  return this.currentIndex < this.segments.length;
};
```

0605 Can Place Flowers

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 605. Can Place Flowers
 * https://leetcode.com/problems/can-place-flowers/
 * Difficulty: Easy
 *
 * You have a long flowerbed in which some of the plots are planted, and some are not.
 * However, flowers cannot be planted in adjacent plots.
 *
 * Given an integer array flowerbed containing 0's and 1's, where 0 means empty and 1
 * means not empty, and an integer n, return true if n new flowers can be planted in
 * the flowerbed without violating the no-adjacent-flowers rule and false otherwise.
 */

/**
 * @param {number[]} flowerbed
 * @param {number} n
 * @return {boolean}
 */
var canPlaceFlowers = function(flowerbed, n) {
  let count = 0;
  for (let i = 0; i < flowerbed.length; i++) {
    if (flowerbed[i] === 0 && flowerbed[i - 1] !== 1 && flowerbed[i + 1] !== 1) {
```

```
      count++;
      flowerbed[i] = 1;
    }
  }
  return count >= n;
};
```

0606 Construct String From Binary Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 606. Construct String from Binary Tree
 * https://leetcode.com/problems/construct-string-from-binary-tree/
 * Difficulty: Easy
 *
 * You need to construct a string consists of parenthesis and integers
 * from a binary tree with the preorder traversing way.
 *
 * The null node needs to be represented by empty parenthesis pair "()".
 * And you need to omit all the empty parenthesis pairs that don't
 * affect the one-to-one mapping relationship between the string
 * and the original binary tree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val) {
 *     this.val = val;
 *     this.left = this.right = null;
 * }
 */
/**
 * @param {TreeNode} t
 * @return {string}
 */
var tree2str = function(t) {
  return !t ? '' :
`${t.val}(${tree2str(t.left)})(${tree2str(t.right)})`.replace(/(\(\)){2}|\(\)(?=$|\))/g, '');
};

// alternative, longer but faster version:
/**
 * @param {TreeNode} t
 * @return {string}
 */
var tree2str = function(t) {
  let str = t ? `${t.val}` : '';
  if (t && t.right) str += `(${tree2str(t.left)})(${tree2str(t.right)})`;
  else if (t && t.left) str += `(${tree2str(t.left)})`;
  return str;
};
```

0609 Find Duplicate File In System

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 609. Find Duplicate File in System
 * https://leetcode.com/problems/find-duplicate-file-in-system/
 * Difficulty: Medium
 *
 * Given a list paths of directory info, including the directory path, and all the files with
 * contents in this directory, return all the duplicate files in the file system in terms of
```

```
 * their paths. You may return the answer in any order.
 *
 * A group of duplicate files consists of at least two files that have the same content.
 *
 * A single directory info string in the input list has the following format:
 * - "root/d1/d2/.../dm f1.txt(f1_content) f2.txt(f2_content) ... fn.txt(fn_content)"
 *
 * It means there are n files (f1.txt, f2.txt ... fn.txt) with content (f1_content, f2_content
 * ... fn_content) respectively in the directory "root/d1/d2/.../dm". Note that n >= 1 and
 * m >= 0. If m = 0, it means the directory is just the root directory.
 *
 * The output is a list of groups of duplicate file paths. For each group, it contains all the
 * file paths of the files that have the same content. A file path is a string that has the
 * following format:
 * - "directory_path/file_name.txt"
 */

/**

  return result;
};
```

0617 Merge Two Binary Trees

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 617. Merge Two Binary Trees
 * https://leetcode.com/problems/merge-two-binary-trees/
 * Difficulty: Easy
 *
 * Given two binary trees and imagine that when you put one
 * of them to cover the other, some nodes of the two trees
 * are overlapped while the others are not.
 *
 * You need to merge them into a new binary tree.
 * The merge rule is that if two nodes overlap, then sum
 * node values up as the new value of the merged node.
 * Otherwise, the NOT null node will be used as the
 * node of new tree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val) {
 *     this.val = val;
 *     this.left = this.right = null;
 * }
 */
/**
 * @param {TreeNode} t1
 * @param {TreeNode} t2
 * @return {TreeNode}
 */
var mergeTrees = function(t1, t2) {
  if (!t1) return t2;
  if (!t2) return t1;

  t1.val += t2.val;
  t1.left = mergeTrees(t1.left, t2.left);
  t1.right = mergeTrees(t1.right, t2.right);

  return t1;
};
```

0621 Task Scheduler

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 621. Task Scheduler
 * https://leetcode.com/problems/task-scheduler/
 * Difficulty: Medium
 *
 * You are given an array of CPU tasks, each labeled with a letter from A to Z, and a number
n.
 * Each CPU interval can be idle or allow the completion of one task. Tasks can be completed
 * in any order, but there's a constraint: there has to be a gap of at least n intervals
 * between two tasks with the same label.
 *
 * Return the minimum number of CPU intervals required to complete all tasks.
 */

/**
 * @param {character[]} tasks
 * @param {number} n
 * @return {number}
```

```
 */
var leastInterval = function(tasks, n) {
  const map = new Map();
  let maxValue = 0;
  let maxCount = 0;

  tasks.forEach(key => {
    const value = map.has(key) ? map.get(key) + 1 : 1;
    map.set(key, value);

    if (value > maxValue) {
      maxValue = value;
      maxCount = 1;
    } else if (value === maxValue) {
      maxCount++;
    }
  });

  return Math.max(tasks.length, (maxValue - 1) * (n + 1) + maxCount);
};
```

0622 Design Circular Queue

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 622. Design Circular Queue
 * https://leetcode.com/problems/design-circular-queue/
 * Difficulty: Medium
 *
 * Design your implementation of the circular queue. The circular queue is a linear data
structure
 * in which the operations are performed based on FIFO (First In First Out) principle, and the
 * last position is connected back to the first position to make a circle. It is also called
 * "Ring Buffer".
 *
 * One of the benefits of the circular queue is that we can make use of the spaces in front of
 * the queue. In a normal queue, once the queue becomes full, we cannot insert the next
element
 * even if there is a space in front of the queue. But using the circular queue, we can use
the
 * space to store new values.
 *
 * Implement the MyCircularQueue class:
 * - MyCircularQueue(k) Initializes the object with the size of the queue to be k.
 * - int Front() Gets the front item from the queue. If the queue is empty, return -1.
 * - int Rear() Gets the last item from the queue. If the queue is empty, return -1.
 * - boolean enQueue(int value) Inserts an element into the circular queue. Return true if the
 *   operation is successful.
 * - boolean deQueue() Deletes an element from the circular queue. Return true if the
operation
 *   is successful.
 * - boolean isEmpty() Checks whether the circular queue is empty or not.
 * - boolean isFull() Checks whether the circular queue is full or not.
 *
 * You must solve the problem without using the built-in queue data structure in your
programming
 * language.
 */

/**
 * @param {number} k
 */
var MyCircularQueue = function(k) {
  this.queue = new Array(k);
  this.size = k;
  this.front = -1;
  this.rear = -1;
};
```

```
/**

0623 Add One Row To Tree

MEDIUM

APPROACH NOTES

Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 623. Add One Row to Tree
 * https://leetcode.com/problems/add-one-row-to-tree/
 * Difficulty: Medium
 *
 * Given the root of a binary tree and two integers val and depth, add a row of nodes with
value
```

```
 * val at the given depth depth.
 *
 * Note that the root node is at depth 1.
 *
 * The adding rule is:
 * - Given the integer depth, for each not null tree node cur at the depth depth - 1, create
two
 *   tree nodes with value val as cur's left subtree root and right subtree root.
 * - cur's original left subtree should be the left subtree of the new left subtree root.
 * - cur's original right subtree should be the right subtree of the new right subtree root.
 * - If depth == 1 that means there is no depth depth - 1 at all, then create a tree node with
 *   value val as the new root of the whole original tree, and the original tree is the new
root's
 *   left subtree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} val
 * @param {number} depth
 * @return {TreeNode}
 */
var addOneRow = function(root, val, depth) {
  if (depth === 1) {
    return new TreeNode(val, root);
  }
  dfs(root, 1);

  return root;

  function dfs(node, level) {
    if (!node) return;
    if (level === depth - 1) {
      node.left = new TreeNode(val, node.left);
      node.right = new TreeNode(val, null, node.right);
      return;
    }
    dfs(node.left, level + 1);
    dfs(node.right, level + 1);
  }
};
```

0624 Maximum Distance In Arrays

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 624. Maximum Distance in Arrays
 * https://leetcode.com/problems/maximum-distance-in-arrays/
 * Difficulty: Medium
 *
 * You are given m arrays, where each array is sorted in ascending order.
 *
 * You can pick up two integers from two different arrays (each array picks one) and calculate
 * the distance. We define the distance between two integers a and b to be their absolute
 * difference |a - b|.
 *
 * Return the maximum distance.
 */

/**
 * @param {number[][]} arrays
```

```
 * @return {number}
 */
var maxDistance = function(arrays) {
  let result = 0;
  let min = arrays[0][0];
  let max = arrays[0][arrays[0].length - 1];

        var prev = maxHeap.dequeue();
        value -= prev;
        value += duration;
        maxHeap.enqueue(duration);
      }
    }
  }

  return maxHeap.size();
};
```

0631 Design Excel Sum Formula

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 631. Design Excel Sum Formula
 * https://leetcode.com/problems/design-excel-sum-formula/
 * Difficulty: Hard
 *
 * Design the basic function of Excel and implement the function of the sum formula.
 *
 * Implement the Excel class:
 * - Excel(int height, char width) Initializes the object with the height and the width
 *   of the sheet. The sheet is an integer matrix mat of size height x width with the row
 *   index in the range [1, height] and the column index in the range ['A', width]. All the
 *   values should be zero initially.
 * - void set(int row, char column, int val) Changes the value at mat[row][column] to be val.
 * - int get(int row, char column) Returns the value at mat[row][column].
 * - int sum(int row, char column, List<String> numbers) Sets the value at mat[row][column] to
 *   be the sum of cells represented by numbers and returns the value at mat[row][column].
 *   This sum formula should exist until this cell is overlapped by another value or another
 *   sum formula. numbers[i] could be on the format:
 *   - "ColRow" that represents a single cell.
 *     - For example, "F7" represents the cell mat[7]['F'].
 *   - "ColRow1:ColRow2" that represents a range of cells. The range will always be a
rectangle
 *     where "ColRow1" represent the position of the top-left cell, and "ColRow2" represents
the
 *     position of the bottom-right cell.
 *     - For example, "B3:F7" represents the cells mat[i][j] for 3 <= i <= 7 and 'B' <= j <=
'F'.
 *
 * Note: You could assume that there will not be any circular sum reference.
 *
```

```
 * For example, mat[1]['A'] == sum(1, "B") and mat[1]['B'] == sum(1, "A").
 */

/**
 * @param {number} height
 * @param {character} width

  let prev2 = 0;
  let prev1 = 1;
  for (let i = 3; i <= n; i++) {
    const current = ((i - 1) * (prev1 + prev2)) % MOD;
    prev2 = prev1;
    prev1 = current;
  }

  return prev1;
};
```

0635 Design Log Storage System

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 635. Design Log Storage System
 * https://leetcode.com/problems/design-log-storage-system/
 * Difficulty: Medium
 *
 * You are given several logs, where each log contains a unique ID and timestamp. Timestamp is
 a
 * string that has the following format: Year:Month:Day:Hour:Minute:Second, for example,
 * 2017:01:01:23:59:59. All domains are zero-padded decimal numbers.
 *
 * Implement the LogSystem class:
 * - LogSystem() Initializes the LogSystem object.
 * - void put(int id, string timestamp) Stores the given log (id, timestamp) in your storage
system.
 * - int[] retrieve(string start, string end, string granularity) Returns the IDs of the logs
whose
 *   timestamps are within the range from start to end inclusive. start and end all have the
same
 *   format as timestamp, and granularity means how precise the range should be (i.e. to the
exact
 *   Day, Minute, etc.). For example, start = "2017:01:01:23:59:59", end =
"2017:01:02:23:59:59",
 *   and granularity = "Day" means that we need to find the logs within the inclusive range
from
 *   Jan. 1st 2017 to Jan. 2nd 2017, and the Hour, Minute, and Second for each log entry can
be
 *   ignored.
 */

var LogSystem = function() {
  this.logs = [];
  this.granularities = {
    Year: 4,
    Month: 7,
    Day: 10,
```

```
    Hour: 13,
    Minute: 16,
    Second: 19
  };
};

/**
 * @param {number} id
 * @param {string} timestamp
 * @return {void}
 */
LogSystem.prototype.put = function(id, timestamp) {
  this.logs.push([timestamp, id]);
};

/**

 * @param {string} end
 * @param {string} granularity
 * @return {number[]}
 */
LogSystem.prototype.retrieve = function(start, end, granularity) {
  const precision = this.granularities[granularity];
  const startKey = start.slice(0, precision).padEnd(19, '0');
  const endKey = end.slice(0, precision).padEnd(19, '9');

  const result = [];
  for (const [timestamp, id] of this.logs) {
    const key = timestamp.slice(0, precision).padEnd(19, '0');
    if (key >= startKey && key <= endKey) {
      result.push(id);
    }
  }

  return result.sort((a, b) => a - b);
};
```

0636 Exclusive Time Of Functions

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 636. Exclusive Time of Functions
 * https://leetcode.com/problems/exclusive-time-of-functions/
 * Difficulty: Medium
 *
 * On a single-threaded CPU, we execute a program containing n functions. Each function has a
 * unique ID between 0 and n-1.
 *
 * Function calls are stored in a call stack: when a function call starts, its ID is pushed
 * onto the stack, and when a function call ends, its ID is popped off the stack. The function
 * whose ID is at the top of the stack is the current function being executed. Each time a
 * function starts or ends, we write a log with the ID, whether it started or ended, and the
 * timestamp.
 *
 * You are given a list logs, where logs[i] represents the ith log message formatted as a
string
 * "{function_id}:{"start" | "end"}:{timestamp}". For example, "0:start:3" means a function
call
 * with function ID 0 started at the beginning of timestamp 3, and "1:end:2" means a function
 * call with function ID 1 ended at the end of timestamp 2. Note that a function can be called
 * multiple times, possibly recursively.
 *
 * A function's exclusive time is the sum of execution times for all function calls in the
program.
 * For example, if a function is called twice, one call executing for 2 time units and another
 * call executing for 1 time unit, the exclusive time is 2 + 1 = 3.
 *
 * Return the exclusive time of each function in an array, where the value at the ith index
 * represents the exclusive time for the function with ID i.
```

```
 */

/**
 * @param {number} n
 * @param {string[]} logs
 * @return {number[]}
 */
var exclusiveTime = function(n, logs) {
  const stack = [];
  const result = new Array(n).fill(0);
  let previousTime = 0;

  for (const log of logs) {
    const [id, action, time] = log.split(':');
    const currentTime = +time;

    if (action === 'start') {
      if (stack.length) {
        result[stack[stack.length - 1]] += currentTime - previousTime;
      }
      stack.push(+id);
      previousTime = currentTime;
    } else {
      result[stack.pop()] += currentTime - previousTime + 1;
      previousTime = currentTime + 1;
    }
  }

  return result;
};
```

0637 Average Of Levels In Binary Tree

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 637. Average of Levels in Binary Tree
 * https://leetcode.com/problems/average-of-levels-in-binary-tree/
 * Difficulty: Easy
 *
 * Given the root of a binary tree, return the average value of the nodes on each level in the
 * form of an array. Answers within 10-5 of the actual answer will be accepted.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */

0639 Decode Ways Ii

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 639. Decode Ways II
 * https://leetcode.com/problems/decode-ways-ii/
 * Difficulty: Hard
 *
 * A message containing letters from A-Z can be encoded into numbers using the following
mapping:
 * - 'A' -> "1"
 * - 'B' -> "2"
 * - 'Z' -> "26"
 *
 * To decode an encoded message, all the digits must be grouped then mapped back into letters
using
 * the reverse of the mapping above (there may be multiple ways). For example, "11106" can be
mapped
 * into:
 * - "AAJF" with the grouping (1 1 10 6)
 * - "KJF" with the grouping (11 10 6)
 *
 * Note that the grouping (1 11 06) is invalid because "06" cannot be mapped into 'F' since
"6" is
 * different from "06".
 *
 * In addition to the mapping above, an encoded message may contain the '*' character, which
can
 * represent any digit from '1' to '9' ('0' is excluded). For example, the encoded message
"1*"
 * may represent any of the encoded messages "11", "12", "13", "14", "15", "16", "17", "18",
or
 * "19". Decoding "1*" is equivalent to decoding any of the encoded messages it can represent.
 *
 * Given a string s consisting of digits and '*' characters, return the number of ways to
decode it.
 *
 * Since the answer may be very large, return it modulo 109 + 7.
 */

/**
 * @param {string} s
 * @return {number}
 */
var numDecodings = function(s) {
  const mod = 1e9 + 7;
  let [i0, i1, i2, i3] = [1, 0, 0, 0];

  return this.isEmpty() ? -1 : this.queue[this.rear];
};

/**
 * @return {boolean}
 */
MyCircularDeque.prototype.isEmpty = function() {
  return this.count === 0;
};

/**
 * @return {boolean}
 */
MyCircularDeque.prototype.isFull = function() {
  return this.count === this.size;
};
```

0642 Design Search Autocomplete System

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 642. Design Search Autocomplete System
 * https://leetcode.com/problems/design-search-autocomplete-system/
 * Difficulty: Hard
 *
 * Design a search autocomplete system for a search engine. Users may input a sentence (at
 * least one word and end with a special character '#').
 *
 * You are given a string array sentences and an integer array times both of length n where
 * sentences[i] is a previously typed sentence and times[i] is the corresponding number of
 * times the sentence was typed. For each input character except '#', return the top 3
 * historical hot sentences that have the same prefix as the part of the sentence already
typed.
 *
 * Here are the specific rules:
 * - The hot degree for a sentence is defined as the number of times a user typed the exactly
 *   same sentence before.
 * - The returned top 3 hot sentences should be sorted by hot degree (The first is the hottest
 *   one). If several sentences have the same hot degree, use ASCII-code order (smaller one
 *   appears first).
 * - If less than 3 hot sentences exist, return as many as you can.
 * - When the input is a special character, it means the sentence ends, and in this case, you
 *   need to return an empty list.
 *
 * Implement the AutocompleteSystem class:
 * - AutocompleteSystem(String[] sentences, int[] times) Initializes the object with the
 *   sentences and times arrays.
 * - List<String> input(char c) This indicates that the user typed the character c.
 *   - Returns an empty array [] if c == '#' and stores the inputted sentence in the system.
 *   - Returns the top 3 historical hot sentences that have the same prefix as the part of the
 *     sentence already typed. If there are fewer than 3 matches, return them all.
 */

/**
```

```
 * @param {string[]} sentences
 * @param {number[]} times
 */
var AutocompleteSystem = function(sentences, times) {
  this.trie = {};
  this.current = '';
  this.root = this.trie;

  for (let i = 0; i < sentences.length; i++) {
    this.insert(sentences[i], times[i]);
  }
};

/**
 * @param {character} c
 * @return {string[]}
 */
AutocompleteSystem.prototype.input = function(c) {
  if (c === '#') {
    this.insert(this.current, 1);
    this.current = '';
    this.root = this.trie;
    return [];
  }

  this.current += c;
  if (!this.root[c]) {
    this.root[c] = {};
    this.root = this.root[c];
    return [];
  }

  this.root = this.root[c];
  const candidates = [];
  this.search(this.root, this.current, candidates);

  candidates.sort((a, b) => {
    if (a.count !== b.count) return b.count - a.count;
    return a.sentence < b.sentence ? -1 : 1;
  });

  return candidates.slice(0, 3).map(item => item.sentence);
};

AutocompleteSystem.prototype.insert = function(sentence, count) {
  let node = this.trie;
  for (const char of sentence) {
    if (!node[char]) node[char] = {};
    node = node[char];
  }
  node.isEnd = (node.isEnd || 0) + count;
};

AutocompleteSystem.prototype.search = function(node, prefix, candidates) {
  if (node.isEnd) {
    candidates.push({ sentence: prefix, count: node.isEnd });
  }

  for (const char in node) {
    if (char !== 'isEnd') {
      this.search(node[char], prefix + char, candidates);
    }
  }
};
```

0643 Maximum Average Subarray I

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 643. Maximum Average Subarray I
 * https://leetcode.com/problems/maximum-average-subarray-i/
 * Difficulty: Easy
 *
 * You are given an integer array nums consisting of n elements, and an integer k.
 *
 * Find a contiguous subarray whose length is equal to k that has the maximum average
 * value and return this value. Any answer with a calculation error less than 10-5
 * will be accepted.
 */

    }
    return word;
  }).join(' ');
};
```

0649 Dota2 Senate

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 649. Dota2 Senate
 * https://leetcode.com/problems/dota2-senate/
 * Difficulty: Medium
 *
 * In the world of Dota2, there are two parties: the Radiant and the Dire.
 *
 * The Dota2 senate consists of senators coming from two parties. Now the Senate wants
 * to decide on a change in the Dota2 game. The voting for this change is a round-based
 * procedure. In each round, each senator can exercise one of the two rights:
 * - Ban one senator's right: A senator can make another senator lose all his rights in
```

```
 *   this and all the following rounds.
 * - Announce the victory: If this senator found the senators who still have rights to
 *   vote are all from the same party, he can announce the victory and decide on the
 *   change in the game.
 *
 * Given a string senate representing each senator's party belonging. The character 'R'
 * and 'D' represent the Radiant party and the Dire party. Then if there are n senators,
 * the size of the given string will be n.
 *
 * The round-based procedure starts from the first senator to the last senator in the
 * given order. This procedure will last until the end of voting. All the senators who
 * have lost their rights will be skipped during the procedure.
 *
 * Suppose every senator is smart enough and will play the best strategy for his own
 * party. Predict which party will finally announce the victory and change the Dota2
 * game. The output should be "Radiant" or "Dire".
*/

/**
 * @param {string} senate
 * @return {string}
 */
var predictPartyVictory = function(senate) {

    return key;
  }
};
```

0653 Two Sum Iv Input Is A Bst

EASY

APPROACH NOTES

Uses a Set for unique membership. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 653. Two Sum IV - Input is a BST
 * https://leetcode.com/problems/two-sum-iv-input-is-a-bst/
 * Difficulty: Easy
 *
 * Given the root of a Binary Search Tree and a target number k, return true
 * if there exist two elements in the BST such that their sum is equal to the
 * given target.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} k
 * @return {boolean}
 */
var findTarget = function(root, k) {
  const set = new Set();
  return dfs(set, root, k);
};

function dfs(set, node, k) {
  if (!node) return false;
  if (set.has(k - node.val)) return true;

  set.add(node.val);

  return dfs(set, node.left, k) || dfs(set, node.right, k);
}
```

0654 Maximum Binary Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 654. Maximum Binary Tree
 * https://leetcode.com/problems/maximum-binary-tree/
 * Difficulty: Medium
 *
 * You are given an integer array nums with no duplicates. A maximum binary tree can be built
 * recursively from nums using the following algorithm:
 * 1. Create a root node whose value is the maximum value in nums.
 * 2. Recursively build the left subtree on the subarray prefix to the left of the maximum
value.
 * 3. Recursively build the right subtree on the subarray suffix to the right of the maximum
value.
 *
 * Return the maximum binary tree built from nums.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {number[]} nums
 * @return {TreeNode}
 */
var constructMaximumBinaryTree = function(nums) {
  if (!nums.length) return null;

  const max = Math.max(...nums);
  const index = nums.indexOf(max);
  const head = new TreeNode(max);

  head.left = constructMaximumBinaryTree(nums.slice(0, index));
  head.right = constructMaximumBinaryTree(nums.slice(index + 1));

  return head;
};
```

0655 Print Binary Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 655. Print Binary Tree
 * https://leetcode.com/problems/print-binary-tree/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, construct a 0-indexed m x n string matrix res that
represents
 * a formatted layout of the tree. The formatted layout matrix should be constructed using the
 * following rules:
 * - The height of the tree is height and the number of rows m should be equal to height + 1.
 * - The number of columns n should be equal to 2height+1 - 1.
 * - Place the root node in the middle of the top row (more formally, at location
res[0][(n-1)/2]).
 * - For each node that has been placed in the matrix at position res[r][c], place its left
child at
 *   res[r+1][c-2height-r-1] and its right child at res[r+1][c+2height-r-1].
```

```
 * - Continue this process until all the nodes in the tree have been placed.
 * - Any empty cells should contain the empty string "".
 *
 * Return the constructed matrix res.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {string[][]}
 */
var printTree = function(root) {
  const height = getHeight(root);

    result[r][c] = node.val.toString();
    fill(node.left, r + 1, c - Math.pow(2, h - r - 1), h);
    fill(node.right, r + 1, c + Math.pow(2, h - r - 1), h);
  }

  function getHeight(node) {
    if (!node) return -1;
    return 1 + Math.max(getHeight(node.left), getHeight(node.right));
  }
};
```

0656 Coin Path

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 656. Coin Path
 * https://leetcode.com/problems/coin-path/
 * Difficulty: Hard
 *
 * You are given an integer array coins (1-indexed) of length n and an integer maxJump. You
can
 * jump to any index i of the array coins if coins[i] != -1 and you have to pay coins[i] when
you
 * visit index i. In addition to that, if you are currently at index i, you can only jump to
any
 * index i + k where i + k <= n and k is a value in the range [1, maxJump].
 *
 * You are initially positioned at index 1 (coins[1] is not -1). You want to find the path
that
 * reaches index n with the minimum cost.
 *
 * Return an integer array of the indices that you will visit in order so that you can reach
 * index n with the minimum cost. If there are multiple paths with the same cost, return the
 * lexicographically smallest such path. If it is not possible to reach index n, return an
 * empty array.
 *
 * A path p1 = [Pa1, Pa2, ..., Pax] of length x is lexicographically smaller than
 * p2 = [Pb1, Pb2, ..., Pbx] of length y, if and only if at the first j where Paj and Pbj
```

```
 * differ, Paj < Pbj; when no such j exists, then x < y.
 */

/**
 * @param {number[]} coins
 * @param {number} maxJump
 * @return {number[]}
 */

```

0657 Robot Return To Origin

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 657. Robot Return to Origin
 * https://leetcode.com/problems/robot-return-to-origin/
 * Difficulty: Easy
 *
 * There is a robot starting at the position (0, 0), the origin, on a 2D plane. Given a
sequence
 * of its moves, judge if this robot ends up at (0, 0) after it completes its moves.
 *
 * You are given a string moves that represents the move sequence of the robot where moves[i]
 * represents its ith move. Valid moves are 'R' (right), 'L' (left), 'U' (up), and 'D' (down).
 *
 * Return true if the robot returns to the origin after it finishes all of its moves, or false
 * otherwise.
 *
 * Note: The way that the robot is "facing" is irrelevant. 'R' will always make the robot move
 * to the right once, 'L' will always make it move left, etc. Also, assume that the magnitude
 * of the robot's movement is the same for each move.
 */

/**
 * @param {string} moves
 * @return {boolean}
 */
/**
 * @param {string} moves
 * @return {boolean}
 */
var judgeCircle = function(moves) {
  let x = 0;
  let y = 0;

  for (const move of moves) {
    x += move === 'R' ? 1 : move === 'L' ? -1 : 0;
    y += move === 'U' ? 1 : move === 'D' ? -1 : 0;
  }

  return x === 0 && y === 0;
};
```

0658 Find K Closest Elements

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 658. Find K Closest Elements
 * https://leetcode.com/problems/find-k-closest-elements/
 * Difficulty: Medium
 *
 * Given a sorted integer array arr, two integers k and x, return the k closest integers to x
 * in the array. The result should also be sorted in ascending order.
 *
 * An integer a is closer to x than an integer b if:
 * - |a - x| < |b - x|, or
 * - |a - x| == |b - x| and a < b
 */

/**
 * @param {number[]} arr
 * @param {number} k
 * @param {number} x
```

```
 * @return {number[]}
 */
var findClosestElements = function(arr, k, x) {
  let left = 0;
  let right = arr.length - k;

  while (left < right) {
    const middle = Math.floor((left + right) / 2);
    const x1 = arr[middle];
    const x2 = arr[middle + k];

    if (x - x1 > x2 - x) {
      left = middle + 1;
    } else {
      right = middle;
    }
  }

  return arr.slice(left, left + k);
};
```

0659 Split Array Into Consecutive Subsequences

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 659. Split Array into Consecutive Subsequences
 * https://leetcode.com/problems/split-array-into-consecutive-subsequences/
 * Difficulty: Medium
 *
 * You are given an integer array nums that is sorted in non-decreasing order.
 *
 * Determine if it is possible to split nums into one or more subsequences such that both of
the
 * following conditions are true:
 * - Each subsequence is a consecutive increasing sequence (i.e. each integer is exactly one
more
 *   than the previous integer).
 * - All subsequences have a length of 3 or more.
 *
 * Return true if you can split nums according to the above conditions, or false otherwise.
 *
 * A subsequence of an array is a new array that is formed from the original array by deleting
 some
 * (can be none) of the elements without disturbing the relative positions of the remaining
 * elements. (i.e., [1,3,5] is a subsequence of [1,2,3,4,5] while [1,3,2] is not).
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */
var isPossible = function(nums) {
  const map = new Map();
  const map2 = new Map();

  for (const n of nums) {
    map.set(n, (map.get(n) || 0) + 1);
  }

  for (const n of nums) {
    if (map.get(n) === 0) continue;

    if ((map2.get(n) || 0) > 0) {
      map2.set(n, map2.get(n) - 1);
      map.set(n, map.get(n) - 1);

      count += Math.min(Math.floor(x / i), n);
    }
    return count;
  }
};
```

0669 Trim A Binary Search Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 669. Trim a Binary Search Tree
 * https://leetcode.com/problems/trim-a-binary-search-tree/
 * Difficulty: Medium
 *
 * Given the root of a binary search tree and the lowest and highest boundaries as low and
high,
 * trim the tree so that all its elements lies in [low, high]. Trimming the tree should not
change
 * the relative structure of the elements that will remain in the tree (i.e., any node's
descendant
 * should remain a descendant). It can be proven that there is a unique answer.
 *
 * Return the root of the trimmed binary search tree. Note that the root may change depending
on
 * the given bounds.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }

        return +digits.join('');
      }
    }
  }

  return num;
};
```

0671 Second Minimum Node In A Binary Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 671. Second Minimum Node In a Binary Tree
 * https://leetcode.com/problems/second-minimum-node-in-a-binary-tree/
 * Difficulty: Easy
 *
 * Given a non-empty special binary tree consisting of nodes with the non-negative value,
 * where each node in this tree has exactly two or zero sub-node. If the node has two
 * sub-nodes, then this node's value is the smaller value among its two sub-nodes. More
 * formally, the property root.val = min(root.left.val, root.right.val) always holds.
 *
 * Given such a binary tree, you need to output the second minimum value in the set made
 * of all the nodes' value in the whole tree.
 *
 * If no such second minimum value exists, output -1 instead.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
```

```
 */

    result = Math.max(result, v);
  }

  return result;
};
```

0675 Cut Off Trees For Golf Event

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 675. Cut Off Trees for Golf Event
 * https://leetcode.com/problems/cut-off-trees-for-golf-event/
 * Difficulty: Hard
 *
 * You are asked to cut off all the trees in a forest for a golf event. The forest is
represented
 * as an m x n matrix. In this matrix:
 * - 0 means the cell cannot be walked through.
 * - 1 represents an empty cell that can be walked through.
 * - A number greater than 1 represents a tree in a cell that can be walked through, and this
number
 *   is the tree's height.
 *
 * In one step, you can walk in any of the four directions: north, east, south, and west. If
you are
 * standing in a cell with a tree, you can choose whether to cut it off.
 *
 * You must cut off the trees in order from shortest to tallest. When you cut off a tree, the
value
 * at its cell becomes 1 (an empty cell).
 *
 * Starting from the point (0, 0), return the minimum steps you need to walk to cut off all
the
 * trees. If you cannot cut off all the trees, return -1.
 *
 * Note: The input is generated such that no two trees have the same height, and there is at
least
 * one tree needs to be cut off.
 */

/**
 * @param {number[][]} forest
 * @return {number}
 */
const cutOffTree = (forest) => {
  const treeHeights = forest.flat().filter((height) => height > 1).sort((a, b) => a - b);

        if (grid[row][col] === targetHeight) return [[row, col], distance];
        if (!grid[row][col]) continue;

        for (const [deltaRow, deltaCol] of directions) {
          const newRow = row + deltaRow;
          const newCol = col + deltaCol;
          if (
            newRow >= 0 && newRow < grid.length && newCol >= 0
            && newCol < grid[0].length && grid[newRow][newCol]
          ) {
            nextLevel.push([newRow, newCol]);
          }
```

```
        }
        grid[row][col] = 0;
      }
      distance += 1;
      queue = nextLevel;
    }
    return null;
  }
};
```

0676 Implement Magic Dictionary

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 676. Implement Magic Dictionary
 * https://leetcode.com/problems/implement-magic-dictionary/
 * Difficulty: Medium
 *
 * Design a data structure that is initialized with a list of different words. Provided a
string,
 * you should determine if you can change exactly one character in this string to match any
word
 * in the data structure.
 *
 * Implement the MagicDictionary class:
 * - MagicDictionary() Initializes the object.
 * - void buildDict(String[] dictionary) Sets the data structure with an array of distinct
 *   strings dictionary.
 * - bool search(String searchWord) Returns true if you can change exactly one character in
 *   searchWord to match any string in the data structure, otherwise returns false.
 */

var MagicDictionary = function() {
  this.words = new Set();
};

/**
 * @param {string[]} dictionary
 * @return {void}
 */
MagicDictionary.prototype.buildDict = function(dictionary) {

      if (word[i] !== words[i]) diff++;
      if (diff > 1) return false;
    }
    return diff === 1;
  });
};
```

0677 Map Sum Pairs

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 677. Map Sum Pairs
 * https://leetcode.com/problems/map-sum-pairs/
 * Difficulty: Medium
 *
 * Design a map that allows you to do the following:
 * - Maps a string key to a given value.
 * - Returns the sum of the values that have a key with a prefix equal to a given string.
 *
 * Implement the MapSum class:
 * - MapSum() Initializes the MapSum object.
 * - void insert(String key, int val) Inserts the key-val pair into the map. If the key
 *   already existed, the original key-value pair will be overridden to the new one.
 * - int sum(string prefix) Returns the sum of all the pairs' value whose key starts
 *   with the prefix.
 */

var MapSum = function() {
  this.map = new Map();
};

/**
 * @param {string} key
 * @param {number} val
 * @return {void}
 */
MapSum.prototype.insert = function(key, val) {
  this.map.set(key, val);
};

/**
 * @param {string} prefix
 * @return {number}
 */
MapSum.prototype.sum = function(prefix) {
  return [...this.map.entries()].reduce((total, [key, val]) => {
    return key.startsWith(prefix) ? total + val : total;
  }, 0);
};
```

0678 Valid Parenthesis String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 678. Valid Parenthesis String
 * https://leetcode.com/problems/valid-parenthesis-string/
 * Difficulty: Medium
 *
 * Given a string s containing only three types of characters: '(', ')' and '*', return
 * true if s is valid.
 *
 * The following rules define a valid string:
 * - Any left parenthesis '(' must have a corresponding right parenthesis ')'.
 * - Any right parenthesis ')' must have a corresponding left parenthesis '('.
 * - Left parenthesis '(' must go before the corresponding right parenthesis ')'.
 * - '*' could be treated as a single right parenthesis ')' or a single left parenthesis
 *   '(' or an empty string "".
 */

/**
 * @param {string} s
 * @return {boolean}
 */
var checkValidString = function(s) {
  let result = 0;
  let offset = 0;

  for (const character of s) {
```

    if (offset < 0) return false;
    result = Math.max(0, result);
  }

  return !result;
};
```

0679 24 Game

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 679. 24 Game
 * https://leetcode.com/problems/24-game/
 * Difficulty: Hard
 *
 * You are given an integer array cards of length 4. You have four cards, each containing a
number
 * in the range [1, 9]. You should arrange the numbers on these cards in a mathematical
expression
 * using the operators ['+', '-', '*', '/'] and the parentheses '(' and ')' to get the value
24.
 *
 * You are restricted with the following rules:
 * - The division operator '/' represents real division, not integer division.
 *   - For example, 4 / (1 - 2 / 3) = 4 / (1 / 3) = 12.
 * - Every operation done is between two numbers. In particular, we cannot use '-' as a
 *   unary operator.
 *   - For example, if cards = [1, 1, 1, 1], the expression "-1 - 1 - 1 - 1" is not allowed.
 * - You cannot concatenate numbers together
 *   - For example, if cards = [1, 2, 1, 2], the expression "12 + 12" is not valid.
 *
 * Return true if you can get such expression that evaluates to 24, and false otherwise.
 */

/**
 * @param {number[]} cards
 * @return {boolean}
 */

```

0685 Redundant Connection Ii

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 685. Redundant Connection II
 * https://leetcode.com/problems/redundant-connection-ii/
 * Difficulty: Hard
 *
 * In this problem, a rooted tree is a directed graph such that, there is exactly one node
 * (the root) for which all other nodes are descendants of this node, plus every node has
 * exactly one parent, except for the root node which has no parents.
 *
 * The given input is a directed graph that started as a rooted tree with n nodes (with
```

```
 * distinct values from 1 to n), with one additional directed edge added. The added edge
 * has two different vertices chosen from 1 to n, and was not an edge that already existed.
 *
 * The resulting graph is given as a 2D-array of edges. Each element of edges is a pair
 * [ui, vi] that represents a directed edge connecting nodes ui and vi, where ui is a parent
 * of child vi.
 *
 * Return an edge that can be removed so that the resulting graph is a rooted tree of n
 * nodes. If there are multiple answers, return the answer that occurs last in the given
2D-array.
 */

```

0688 Knight Probability In Chessboard

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 688. Knight Probability in Chessboard
 * https://leetcode.com/problems/knight-probability-in-chessboard/
 * Difficulty: Medium
 *
 * On an n x n chessboard, a knight starts at the cell (row, column) and attempts to make
exactly
```

```
 * k moves. The rows and columns are 0-indexed, so the top-left cell is (0, 0), and the
bottom-right
 * cell is (n - 1, n - 1).
 *
 * A chess knight has eight possible moves it can make, as illustrated below. Each move is two
 cells
 * in a cardinal direction, then one cell in an orthogonal direction.
 *
 * Each time the knight is to move, it chooses one of eight possible moves uniformly at random
 * (even if the piece would go off the chessboard) and moves there.
 *
 * The knight continues moving until it has made exactly k moves or has moved off the
chessboard.
 *
 * Return the probability that the knight remains on the board after it has stopped moving.
 */

    }
    root = root.val > val ? root.left : root.right;
  }

  return null;
};
```

0701 Insert Into A Binary Search Tree

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 701. Insert into a Binary Search Tree
 * https://leetcode.com/problems/insert-into-a-binary-search-tree/
 * Difficulty: Medium
 *
 * You are given the root node of a binary search tree (BST) and a value
 * to insert into the tree. Return the root node of the BST after the
```

```
 * insertion. It is guaranteed that the new value does not exist in the
 * original BST.
 *
 * Notice that there may exist multiple valid ways for the insertion,
 * as long as the tree remains a BST after insertion. You can return
 * any of them.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} val
 * @return {TreeNode}
 */
var insertIntoBST = function(root, val) {
  if (!root) {
    return new TreeNode(val);
  }

  if (val > root.val) {
    root.right = insertIntoBST(root.right, val);
  } else {
    root.left = insertIntoBST(root.left, val);
  }

  return root;
};
```

0702 Search In A Sorted Array Of Unknown Size

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 702. Search in a Sorted Array of Unknown Size
 * https://leetcode.com/problems/search-in-a-sorted-array-of-unknown-size/
 * Difficulty: Medium
 *
 * This is an interactive problem.
 *
 * You have a sorted array of unique elements and an unknown size. You do not have an access
 * to the array but you can use the ArrayReader interface to access it. You can call
 * ArrayReader.get(i) that:
 * - returns the value at the ith index (0-indexed) of the secret array (i.e., secret[i]), or
 * - returns 231 - 1 if the i is out of the boundary of the array.
 *
 * You are also given an integer target.
 *
 * Return the index k of the hidden array where secret[k] == target or return -1 otherwise.
 *
 * You must write an algorithm with O(log n) runtime complexity.
 */

/**
 * @param {ArrayReader} reader
 * @param {number} target
 * @return {number}
 */
var search = function(reader, target) {
  let left = 0;
  let right = 1;

  while (reader.get(right) < target) {
    left = right;
```

```
    right *= 2;
  }

  while (left <= right) {
    const mid = Math.floor((left + right) / 2);
    const value = reader.get(mid);

    if (value === target) {
      return mid;
    } else if (value < target) {
      left = mid + 1;
    } else {
      right = mid - 1;
    }
  }

  return -1;
};
```

0703 Kth Largest Element In A Stream

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 703. Kth Largest Element in a Stream
 * https://leetcode.com/problems/kth-largest-element-in-a-stream/
 * Difficulty: Easy
 *
 * You are part of a university admissions office and need to keep track of the kth highest
test
 * score from applicants in real-time. This helps to determine cut-off marks for interviews
and
 * admissions dynamically as new applicants submit their scores.
 *
 * You are tasked to implement a class which, for a given integer k, maintains a stream of
test
 * scores and continuously returns the kth highest test score after a new score has been
submitted.
 * More specifically, we are looking for the kth highest score in the sorted list of all
scores.
 *
 * Implement the KthLargest class:
 * - KthLargest(int k, int[] nums) Initializes the object with the integer k and the stream of
 *   test scores nums.
 * - int add(int val) Adds a new test score val to the stream and returns the element
representing
 *   the kth largest element in the pool of test scores so far.
 */

/**
 * @param {number} k
 * @param {number[]} nums
 */
var KthLargest = function(k, nums) {
  this.main = new MinPriorityQueue();
  this.k = k;

  nums.forEach(n => this.main.enqueue(n));

  while (this.main.size() > k) {
    this.main.dequeue().element;
  }
};

/**
 * @param {number} val
 * @return {number}
 */
KthLargest.prototype.add = function(val) {
  this.main.enqueue(val);
```

```
  if (this.main.size() > this.k) {
    this.main.dequeue().element;
  }

  return this.main.front().element;
};
```

0704 Binary Search

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 704. Binary Search
 * https://leetcode.com/problems/binary-search/
 * Difficulty: Easy
 *
 * Given an array of integers nums which is sorted in ascending order, and an
 * integer target, write a function to search target in nums. If target exists,
 * then return its index. Otherwise, return -1.
 *
 * You must write an algorithm with O(log n) runtime complexity.
 */

/**
 * @param {number[]} nums
 * @param {number} target
 * @return {number}
 */
var search = function(nums, target) {
  let left = 0;
  let right = nums.length - 1;

  while (left <= right) {
    const pivot = Math.floor((right + left) / 2);
    if (nums[pivot] === target) return pivot;
    if (target < nums[pivot]) right = pivot - 1;
    else left = pivot + 1;
  }

  return -1;
};
```

0705 Design Hashset

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 705. Design HashSet
 * https://leetcode.com/problems/design-hashset/
 * Difficulty: Easy
 *
 * Design a HashSet without using any built-in hash table libraries.
 *
 * Implement MyHashSet class:
 * - void add(key) Inserts the value key into the HashSet.
 * - bool contains(key) Returns whether the value key exists in the
 *   HashSet or not.
 * - void remove(key) Removes the value key in the HashSet. If key
 *   does not exist in the HashSet, do nothing.
 */

var MyHashSet = function() {
  this._keys = [];
};
```

```
/**
 * @param {number} key
 * @return {void}
 */
MyHashSet.prototype.add = function(key) {
  this._keys[key] = 1;
};

/**
 * @param {number} key
 * @return {void}
 */
MyHashSet.prototype.remove = function(key) {
  this._keys[key] = undefined;
};

/**
 * @param {number} key
 * @return {boolean}
 */
MyHashSet.prototype.contains = function(key) {
  return this._keys[key] !== undefined;
};
```

0706 Design Hashmap

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 706. Design HashMap
 * https://leetcode.com/problems/design-hashmap/
 * Difficulty: Easy
 *
 * Design a HashMap without using any built-in hash table libraries.
 * Implement the MyHashMap class:
 * - MyHashMap() initializes the object with an empty map.
 * - void put(int key, int value) inserts a (key, value) pair into the HashMap.
 *   If the key already exists in the map, update the corresponding value.
 * - int get(int key) returns the value to which the specified key is mapped,
 *   or -1 if this map contains no mapping for the key.
 * - void remove(key) removes the key and its corresponding value if the map
 *   contains the mapping for the key.
 */

var MyHashMap = function() {
  this._keys = [];
  this._values = [];
};

/**
 * @param {number} key
 * @param {number} value
 * @return {void}
 */
MyHashMap.prototype.put = function(key, value) {
  if (this._keys[key] === undefined) {
    this._values.push(value);
    this._keys[key] = this._values.length - 1;
  } else {
    this._values[this._keys[key]] = value;
  }
};

/**
 * @param {number} key
 * @return {number}
 */
MyHashMap.prototype.get = function(key) {
```

```
  const offset = this._keys[key];
  return offset === undefined ? -1 : this._values[offset];
}
/**
 * @param {number} key
 * @return {void}
 */
MyHashMap.prototype.remove = function(key) {
  if (this._keys[key] !== undefined) {
    this._values[this._keys[key]] = undefined;
    this._keys[key] = undefined;
  }
};
```

0707 Design Linked List

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 707. Design Linked List
 * https://leetcode.com/problems/design-linked-list/
 * Difficulty: Medium
 *
 * Design your implementation of the linked list. You can choose to use a singly or
 * doubly linked list.
 *
 * A node in a singly linked list should have two attributes: val and next. val is the value
 * of the current node, and next is a pointer/reference to the next node.
 *
 * If you want to use the doubly linked list, you will need one more attribute prev to
indicate
 * the previous node in the linked list. Assume all nodes in the linked list are 0-indexed.
 *
 * Implement the MyLinkedList class:
 * - MyLinkedList() Initializes the MyLinkedList object.
 * - int get(int index) Get the value of the indexth node in the linked list. If the
 *   index is invalid, return -1.
 * - void addAtHead(int val) Add a node of value val before the first element of the
 *   linked list. After the insertion, the new node will be the first node of the linked list.
 * - void addAtTail(int val) Append a node of value val as the last element of the linked
list.
 * - void addAtIndex(int index, int val) Add a node of value val before the indexth node
 *   in the linked list. If index equals the length of the linked list, the node will be
 *   appended to the end of the linked list. If index is greater than the length, the node
 *   will not be inserted.
 * - void deleteAtIndex(int index) Delete the indexth node in the linked list, if the index
 *   is valid.
 */

var MyLinkedList = function() {
  this.head = null;
  this.size = 0;
};

/**
 * @param {number} index
 * @return {number}
 */
MyLinkedList.prototype.get = function(index) {
  if (index < 0 || index >= this.size) return -1;
  let current = this.head;
  while (index--) current = current.next;
  return current.val;
};

/**
 * @param {number} val
 * @return {void}
 */

}
```

0708 Insert Into A Sorted Circular Linked List

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 708. Insert into a Sorted Circular Linked List
 * https://leetcode.com/problems/insert-into-a-sorted-circular-linked-list/
 * Difficulty: Medium
 *
```

```
 * Given a Circular Linked List node, which is sorted in non-descending order, write a
 * function to insert a value insertVal into the list such that it remains a sorted
 * circular list. The given node can be a reference to any single node in the list and
 * may not necessarily be the smallest value in the circular list.
 *
 * If there are multiple suitable places for insertion, you may choose any place to
 * insert the new value. After the insertion, the circular list should remain sorted.
 *
 * If the list is empty (i.e., the given node is null), you should create a new single
 * circular list and return the reference to that single node. Otherwise, you should
 * return the originally given node.
 */

/**
 * @param {_Node} head
 * @param {number} insertVal
 * @return {_Node}
 */
var insert = function(head, insertVal) {
  const newNode = new _Node(insertVal, null);

  if (!head) {
    newNode.next = newNode;
    return newNode;
  }

  if (head.next === head) {
    newNode.next = head;
    head.next = newNode;
    return head;
  }

  let prev = head;
  let curr = head.next;
  do {
    if ((prev.val <= insertVal && insertVal <= curr.val)
        || (prev.val > curr.val && (insertVal >= prev.val || insertVal <= curr.val))) {
      break;
    }
    prev = curr;
    curr = curr.next;
  } while (prev !== head);

  prev.next = newNode;
  newNode.next = curr;

  return head;
};
```

0709 To Lower Case

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 709. To Lower Case
 * https://leetcode.com/problems/to-lower-case/
 * Difficulty: Easy
 *
 * Given a string s, return the string after replacing every uppercase letter with the same
 * lowercase letter.
 */

/**
 * @param {string} s
 * @return {string}
 */
var toLowerCase = function(s) {
  return s.toLowerCase();
};
```

0710 Random Pick With Blacklist

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 710. Random Pick with Blacklist
 * https://leetcode.com/problems/random-pick-with-blacklist/
 * Difficulty: Hard
 *
 * You are given an integer n and an array of unique integers blacklist. Design an algorithm
to
 * pick a random integer in the range [0, n - 1] that is not in blacklist. Any integer that is
 * in the mentioned range and not in blacklist should be equally likely to be returned.
 *
 * Optimize your algorithm such that it minimizes the number of calls to the built-in random
 * function of your language.
 *
 * Implement the Solution class:
 * - Solution(int n, int[] blacklist) Initializes the object with the integer n and the
 *   blacklisted integers blacklist.
 * - int pick() Returns a random integer in the range [0, n - 1] and not in blacklist.
 */

/**
 * @param {number} n
 * @param {number[]} blacklist
 */
var Solution = function(n, blacklist) {
  this.size = n - blacklist.length;
  this.mapping = new Map();
  blacklist = new Set(blacklist);

  let last = n - 1;
  for (const b of blacklist) {
    if (b < this.size) {
      while (blacklist.has(last)) last--;
      this.mapping.set(b, last--);
    }
  }
};

/**
 * @return {number}
 */
Solution.prototype.pick = function() {
  const index = Math.floor(Math.random() * this.size);
  return this.mapping.get(index) ?? index;
};
```

0711 Number Of Distinct Islands Ii

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 711. Number of Distinct Islands II
 * https://leetcode.com/problems/number-of-distinct-islands-ii/
 * Difficulty: Hard
 *
 * You are given an m x n binary matrix grid. An island is a group of 1's (representing land)
 * connected 4-directionally (horizontal or vertical.) You may assume all four edges of the
 * grid are surrounded by water.
 *
 * An island is considered to be the same as another if they have the same shape, or have
```

```
 * the same shape after rotation (90, 180, or 270 degrees only) or reflection (left/right
 * direction or up/down direction).
 *
 * Return the number of distinct islands.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var numDistinctIslands2 = function(grid) {

```

0715 Range Module

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 715. Range Module
 * https://leetcode.com/problems/range-module/
 * Difficulty: Hard
 *
 * A Range Module is a module that tracks ranges of numbers. Design a data structure to track
the
 * ranges represented as half-open intervals and query about them.
 *
 * A half-open interval [left, right) denotes all the real numbers x where left <= x < right.
 *
 * Implement the RangeModule class:
 * - RangeModule() Initializes the object of the data structure.
 * - void addRange(int left, int right) Adds the half-open interval [left, right), tracking
every
```

```
 *   real number in that interval. Adding an interval that partially overlaps with currently
tracked
 *   numbers should add any numbers in the interval [left, right) that are not already
tracked.
 * - boolean queryRange(int left, int right) Returns true if every real number in the interval
 *   [left, right) is currently being tracked, and false otherwise.
 * - void removeRange(int left, int right) Stops tracking every real number currently being
tracked
 *   in the half-open interval [left, right).
 */

var RangeModule = function() {
  this.ranges = [];
};

/**
 * @param {number} left
 * @param {number} right
 * @return {void}
 */
RangeModule.prototype.addRange = function(left, right) {
  const intervals = [];
  let placed = false;

0716 Max Stack

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 716. Max Stack
 * https://leetcode.com/problems/max-stack/
 * Difficulty: Hard
 *
 * Design a max stack data structure that supports the stack operations and supports finding
 * the stack's maximum element.
 *
 * Implement the MaxStack class:
 * - MaxStack() Initializes the stack object.
 * - void push(int x) Pushes element x onto the stack.
 * - int pop() Removes the element on top of the stack and returns it.
 * - int top() Gets the element on the top of the stack without removing it.
 * - int peekMax() Retrieves the maximum element in the stack without removing it.
 * - int popMax() Retrieves the maximum element in the stack and removes it. If there is more
 *   than one maximum element, only remove the top-most one.
 *
 * You must come up with a solution that supports O(1) for each top call and O(logn) for each
 * other call.
 */

var MaxStack = function() {
  this.stack = [];

0720 Longest Word In Dictionary

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 720. Longest Word in Dictionary
 * https://leetcode.com/problems/longest-word-in-dictionary/
 * Difficulty: Medium
 *
 * Given an array of strings words representing an English Dictionary, return the longest word
 * in words that can be built one character at a time by other words in words.
 *
 * If there is more than one possible answer, return the longest word with the smallest
 * lexicographical order. If there is no answer, return the empty string.
 *
 * Note that the word should be built from left to right with each additional character being
 * added to the end of a previous word.
 */

/**
 * @param {string[]} words
 * @return {string}
 */
var longestWord = function(words) {
  const set = new Set();
  let result = '';

  words.sort().forEach(word => {
    if (word.length === 1 || set.has(word.slice(0, -1))) {
      set.add(word);
      result = word.length > result.length ? word : result;
    }
  });

  return result;
};
```

0721 Accounts Merge

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 721. Accounts Merge
 * https://leetcode.com/problems/accounts-merge/
 * Difficulty: Medium
 *
 * Given a list of accounts where each element accounts[i] is a list of strings, where the
first
 * element accounts[i][0] is a name, and the rest of the elements are emails representing
emails
 * of the account.
 *
 * Now, we would like to merge these accounts. Two accounts definitely belong to the same
person
 * if there is some common email to both accounts. Note that even if two accounts have the
same
 * name, they may belong to different people as people could have the same name. A person can
 * have any number of accounts initially, but all of their accounts definitely have the same
name.
 *
 * After merging the accounts, return the accounts in the following format: the first element
of
 * each account is the name, and the rest of the elements are emails in sorted order. The
accounts
 * themselves can be returned in any order.
```

```
 */

/**
 * @param {string[][]} accounts
 * @return {string[][]}
 */
var accountsMerge = function(accounts) {
  const parent = new Map();
  const names = new Map();
  const groups = new Map();

  const find = node => {
    if (!parent.has(node)) parent.set(node, node);
    return parent.get(node) === node ? node : parent.set(node,
find(parent.get(node))).get(node);
  };

  for (const [name, ...emails] of accounts) {
    for (const email of emails) {
      names.set(email, name);
      find(email);
      parent.set(find(email), find(emails[0]));
    }
  }

  for (const email of parent.keys()) {
    const root = find(email);
    if (!groups.has(root)) groups.set(root, new Set());
    groups.get(root).add(email);
  }

  return Array.from(groups, ([root, emails]) => [names.get(root), ...[...emails].sort()]);
};
```

0722 Remove Comments

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 722. Remove Comments
 * https://leetcode.com/problems/remove-comments/
 * Difficulty: Medium
 *
 * Given a C++ program, remove comments from it. The program source is an array where
source[i] is the i-th
 * line of the source code. This represents the result of splitting the original source code
string by the
 * newline character \n.
 * In C++, there are two types of comments, line comments, and block comments.
 * The string // denotes a line comment, which represents that it and rest of the characters
to the right
 * of it in the same line should be ignored.
 * The string /* denotes a block comment, which represents that all characters until the next
 * (non-overlapping) occurrence of should be ignored.
 * It is guaranteed that every open block comment will eventually be closed, so /* outside of
a line or block
 * comment always starts a new comment.
 * Finally, implicit newline characters can be deleted by block comments.
 * After removing the comments from the source code, return the source code in the same
format.
 */

/**
 * @param {string[]} source
 * @return {string[]}
 */
var removeComments = function(source) {
  return source.join('\n').replace(/\/\*.*?\*\/|\/\/[^\n]+/gs,
'').split(/\n/).filter(Boolean);
};
```

0723 Candy Crush

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 723. Candy Crush
 * https://leetcode.com/problems/candy-crush/
 * Difficulty: Medium
 *
 * This question is about implementing a basic elimination algorithm for Candy Crush.
 *
 * Given an m x n integer array board representing the grid of candy where board[i][j]
represents
 * the type of candy. A value of board[i][j] == 0 represents that the cell is empty.
 *
 * The given board represents the state of the game following the player's move. Now, you need
 to
 * restore the board to a stable state by crushing candies according to the following rules:
 * - If three or more candies of the same type are adjacent vertically or horizontally, crush
them
 *   all at the same time - these positions become empty.
 * - After crushing all candies simultaneously, if an empty space on the board has candies on
top
 *   of itself, then these candies will drop until they hit a candy or bottom at the same
time.
 *   No new candies will drop outside the top boundary.
 * - After the above steps, there may exist more candies that can be crushed. If so, you need
to
 *   repeat the above steps.
 * - If there does not exist more candies that can be crushed (i.e., the board is stable),
then
 *   return the current board.
 *
 * You need to perform the above rules until the board becomes stable, then return the stable
board.
 */

/**

```

0726 Number Of Atoms

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 726. Number of Atoms
 * https://leetcode.com/problems/number-of-atoms/
 * Difficulty: Hard
 *
 * Given a string formula representing a chemical formula, return the count of each atom.
 *
 * The atomic element always starts with an uppercase character, then zero or more lowercase
 * letters, representing the name.
 *
 * One or more digits representing that element's count may follow if the count is greater
 * than 1. If the count is 1, no digits will follow.
 * - For example, "H2O" and "H2O2" are possible, but "H1O2" is impossible.
 *
 * Two formulas are concatenated together to produce another formula.
 * - For example, "H2O2He3Mg4" is also a formula.
 *
 * A formula placed in parentheses, and a count (optionally added) is also a formula.
 * - For example, "(H2O2)" and "(H2O2)3" are formulas.
 *
 * Return the count of all elements as a string in the following form: the first name (in
sorted
 * order), followed by its count (if that count is more than 1), followed by the second name
 * (in sorted order), followed by its count (if that count is more than 1), and so on.
 *
 * The test cases are generated so that all the values in the output fit in a 32-bit integer.
 */

0728 Self Dividing Numbers

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 728. Self Dividing Numbers
 * https://leetcode.com/problems/self-dividing-numbers/
 * Difficulty: Easy
 *
 * A self-dividing number is a number that is divisible by every digit it contains.
 * - For example, 128 is a self-dividing number because 128 % 1 == 0, 128 % 2 == 0,
 *   and 128 % 8 == 0.
 *
 * A self-dividing number is not allowed to contain the digit zero.
```

```
 *
 * Given two integers left and right, return a list of all the self-dividing numbers
 * in the range [left, right] (both inclusive).
 */

/**
 * @param {number} left
 * @param {number} right
 * @return {number[]}
 */
var selfDividingNumbers = function(left, right) {
  return Array.from({ length: right - left + 1 }, (_, i) => left + i)
    .filter(n => String(n).split('').every(d => d !== '0' && n % d === 0));
};
```

0729 My Calendar I

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 729. My Calendar I
 * https://leetcode.com/problems/my-calendar-i/
 * Difficulty: Medium
 *
 * You are implementing a program to use as your calendar. We can add a new event if adding
the
 * event will not cause a double booking.
 *
 * A double booking happens when two events have some non-empty intersection (i.e., some
moment
 * is common to both events.).
 *
 * The event can be represented as a pair of integers startTime and endTime that represents a
 * booking on the half-open interval [startTime, endTime), the range of real numbers x such
 * that startTime <= x < endTime.
 *
 * Implement the MyCalendar class:
 * - MyCalendar() Initializes the calendar object.
 * - boolean book(int startTime, int endTime) Returns true if the event can be added to the
 *   calendar successfully without causing a double booking. Otherwise, return false and do
 *   not add the event to the calendar.

0731 My Calendar Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 731. My Calendar II
 * https://leetcode.com/problems/my-calendar-ii/
 * Difficulty: Medium
 *
 * You are implementing a program to use as your calendar. We can add a new event if adding
the
 * event will not cause a triple booking.
 *
 * A triple booking happens when three events have some non-empty intersection (i.e., some
moment
 * is common to all the three events.).
 *
 * The event can be represented as a pair of integers startTime and endTime that represents a
 * booking on the half-open interval [startTime, endTime), the range of real numbers x such
that
 * startTime <= x < endTime.
 *
 * Implement the MyCalendarTwo class:
 * - MyCalendarTwo() Initializes the calendar object.
 * - boolean book(int startTime, int endTime) Returns true if the event can be added to the
calendar
 *   successfully without causing a triple booking. Otherwise, return false and do not add the
 event
 *   to the calendar.
 */

var MyCalendarTwo = function() {
  this.bookings = [];
  this.overlaps = [];
};

/**
 * @param {number} startTime
 * @param {number} endTime
 * @return {boolean}
```

```
 */
MyCalendarTwo.prototype.book = function(startTime, endTime) {
  for (const [start, end] of this.overlaps) {
    if (startTime < end && endTime > start) return false;
  }

  for (const [start, end] of this.bookings) {
    if (startTime < end && endTime > start) {
      this.overlaps.push([Math.max(start, startTime), Math.min(end, endTime)]);
    }
  }

  this.bookings.push([startTime, endTime]);
  return true;
};
```

0732 My Calendar Iii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 732. My Calendar III
 * https://leetcode.com/problems/my-calendar-iii/
 * Difficulty: Hard
 *
 * A k-booking happens when k events have some non-empty intersection (i.e., there is some
time
 * that is common to all k events.)
 *
 * You are given some events [startTime, endTime), after each given event, return an integer k
 * representing the maximum k-booking between all the previous events.
 *
 * Implement the MyCalendarThree class:
 * - MyCalendarThree() Initializes the object.
 * - int book(int startTime, int endTime) Returns an integer k representing the largest
integer
 *   such that there exists a k-booking in the calendar.
 */

class MyCalendarThree {

```

0733 Flood Fill

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 733. Flood Fill
 * https://leetcode.com/problems/flood-fill/
 * Difficulty: Easy
 *
 * An image is represented by an m x n integer grid image where image[i][j] represents
 * the pixel value of the image.
 *
 * You are also given three integers sr, sc, and newColor. You should perform a flood
 * fill on the image starting from the pixel image[sr][sc].
 *
 * To perform a flood fill, consider the starting pixel, plus any pixels connected
 * 4-directionally to the starting pixel of the same color as the starting pixel,
 * plus any pixels connected 4-directionally to those pixels (also with the same color),
 * and so on. Replace the color of all of the aforementioned pixels with newColor.
 *
 * Return the modified image after performing the flood fill.
 */

/**
 * @param {number[][]} image
 * @param {number} sr
 * @param {number} sc
 * @param {number} newColor
 * @return {number[][]}
 */
var floodFill = function(image, sr, sc, newColor) {
  fill(image, sr, sc, image[sr][sc], newColor);
  return image;
};

function fill(image, x, y, initialColor, newColor) {
  if (image[x] && image[x][y] === initialColor && initialColor !== newColor) {
    image[x][y] = newColor;
    [[x - 1, y], [x + 1, y], [x, y - 1], [x, y + 1]]
      .forEach(([x, y]) => fill(image, x, y, initialColor, newColor));
  }
}
```

0734 Sentence Similarity

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 734. Sentence Similarity
 * https://leetcode.com/problems/sentence-similarity/
 * Difficulty: Easy
 *
 * We can represent a sentence as an array of words, for example, the sentence
 * "I am happy with leetcode" can be represented as arr = ["I","am",happy","with","leetcode"].
 *
 * Given two sentences sentence1 and sentence2 each represented as a string array and given an
 * array of string pairs similarPairs where similarPairs[i] = [xi, yi] indicates that the two
 * words xi and yi are similar.
```

```
 *
 * Return true if sentence1 and sentence2 are similar, or false if they are not similar.
 *
 * Two sentences are similar if:
 * - They have the same length (i.e., the same number of words)
 * - sentence1[i] and sentence2[i] are similar.
 *
 * Notice that a word is always similar to itself, also notice that the similarity relation is
 * not transitive. For example, if the words a and b are similar, and the words b and c are
 * similar, a and c are not necessarily similar.
 */

/**
 * @param {string[]} sentence1
 * @param {string[]} sentence2
 * @param {string[][]} similarPairs
 * @return {boolean}
 */
var areSentencesSimilar = function(sentence1, sentence2, similarPairs) {
  if (sentence1.length !== sentence2.length) {
    return false;
  }

  const similarWords = new Set();
  for (const [word1, word2] of similarPairs) {
    similarWords.add(`${word1}:${word2}`);
    similarWords.add(`${word2}:${word1}`);
  }

  for (let i = 0; i < sentence1.length; i++) {
    const word1 = sentence1[i];
    const word2 = sentence2[i];
    if (word1 !== word2 && !similarWords.has(`${word1}:${word2}`)) {
      return false;
    }
  }

  return true;
};
```

0735 Asteroid Collision

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 735. Asteroid Collision
 * https://leetcode.com/problems/asteroid-collision/
 * Difficulty: Medium
 *
 * We are given an array asteroids of integers representing asteroids in a row. The indices
 * of the asteriod in the array represent their relative position in space.
 *
 * For each asteroid, the absolute value represents its size, and the sign represents its
 * direction (positive meaning right, negative meaning left). Each asteroid moves at the
 * same speed.
 *
 * Find out the state of the asteroids after all collisions. If two asteroids meet, the
 * smaller one will explode. If both are the same size, both will explode. Two asteroids
 * moving in the same direction will never meet.
 */

/**
 * @param {number[]} asteroids
 * @return {number[]}
 */
var asteroidCollision = function(asteroids) {
  const result = [];

  for (let i = 0; i < asteroids.length; i++) {
    const previous = result[result.length - 1];
```

```
    const current = asteroids[i];

    if (!result.length || previous < 0 || current > 0) {
      result.push(current);
    } else if (-current === previous) {
      result.pop();
    } else if (-current > previous) {
      result.pop();
      i--;
    }
  }

  return result;
};
```

0736 Parse Lisp Expression

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 736. Parse Lisp Expression
 * https://leetcode.com/problems/parse-lisp-expression/
 * Difficulty: Hard
 *
 * You are given a string expression representing a Lisp-like expression to return the integer
 * value of.
 *
 * The syntax for these expressions is given as follows.
 * - An expression is either an integer, let expression, add expression, mult expression, or
an
 *   assigned variable. Expressions always evaluate to a single integer.
 * - (An integer could be positive or negative.)
 * - A let expression takes the form "(let v1 e1 v2 e2 ... vn en expr)", where let is always
the
 *   string "let", then there are one or more pairs of alternating variables and expressions,
 *   meaning that the first variable v1 is assigned the value of the expression e1, the second
 *   variable v2 is assigned the value of the expression e2, and so on sequentially; and then
the
 *   value of this let expression is the value of the expression expr.
 * - An add expression takes the form "(add e1 e2)" where add is always the string "add",
there are
 *   always two expressions e1, e2 and the result is the addition of the evaluation of e1 and
the
 *   evaluation of e2.
 * - A mult expression takes the form "(mult e1 e2)" where mult is always the string "mult",
there
 *   are always two expressions e1, e2 and the result is the multiplication of the evaluation
of
 *   e1 and the evaluation of e2.
 * - For this question, we will use a smaller subset of variable names. A variable starts with
 a
 *   lowercase letter, then zero or more lowercase letters or digits. Additionally, for your
 *   convenience, the names "add", "let", and "mult" are protected and will never be used as
 *   variable names.
 * - Finally, there is the concept of scope. When an expression of a variable name is
evaluated,
 *   within the context of that evaluation, the innermost scope (in terms of parentheses) is
 *   checked first for the value of that variable, and then outer scopes are checked
sequentially.
 *   It is guaranteed that every expression is legal. Please see the examples for more details
 *   on the scope.
 */

/**
 * @param {string} expression
 * @return {number}
 */
var evaluate = function(expression) {
  return parse(expression, new Map());
```

```
  function parse(exp, scope) {
    if (!isNaN(exp)) return parseInt(exp);
    if (!exp.startsWith('(')) return scope.get(exp) || 0;

    const tokens = tokenize(exp.slice(1, -1));
    if (tokens[0] === 'add') return parse(tokens[1], scope) + parse(tokens[2], scope);
    if (tokens[0] === 'mult') return parse(tokens[1], scope) * parse(tokens[2], scope);

    const newScope = new Map(scope);
    for (let i = 1; i < tokens.length - 1; i += 2) {
      newScope.set(tokens[i], parse(tokens[i + 1], newScope));
    }
    return parse(tokens[tokens.length - 1], newScope);
  }

  function tokenize(exp) {
    const result = [];
    let current = '';
    let depth = 0;

    for (const char of exp) {
      if (char === ' ' && depth === 0) {
        result.push(current);
        current = '';
      } else {
        current += char;
        if (char === '(') depth++;
        if (char === ')') depth--;
      }
    }
    result.push(current);
    return result;
  }
};
```

    previous = temp;
  }

  return result;
};
```

0741 Cherry Pickup

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 741. Cherry Pickup
 * https://leetcode.com/problems/cherry-pickup/
 * Difficulty: Hard
 *
 * You are given an n x n grid representing a field of cherries, each cell is one of three
 * possible integers.
 * - 0 means the cell is empty, so you can pass through,
 * - 1 means the cell contains a cherry that you can pick up and pass through, or
 * - -1 means the cell contains a thorn that blocks your way.
 *
 * Return the maximum number of cherries you can collect by following the rules below:
 * - Starting at the position (0, 0) and reaching (n - 1, n - 1) by moving right or down
through
 *   valid path cells (cells with value 0 or 1).
 * - After reaching (n - 1, n - 1), returning to (0, 0) by moving left or up through valid
path
 *   cells.
 * - When passing through a path cell containing a cherry, you pick it up, and the cell
becomes
 *   an empty cell 0.
 * - If there is no valid path between (0, 0) and (n - 1, n - 1), then no cherries can be
collected.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */

      if (time[u] === Infinity) continue;
      if (time[v] > time[u] + w) {
        time[v] = time[u] + w;
      }
    }
  }

  let result = 0;
  for (let i = 1; i <= n; i++) {
    result = Math.max(result, time[i]);
  }

  return result === Infinity ? -1 : result;
};
```

0744 Find Smallest Letter Greater Than Target

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 744. Find Smallest Letter Greater Than Target
 * https://leetcode.com/problems/find-smallest-letter-greater-than-target/
 * Difficulty: Easy
 *
 * You are given an array of characters letters that is sorted in non-decreasing order,
 * and a character target. There are at least two different characters in letters.
 *
 * Return the smallest character in letters that is lexicographically greater than target.
 * If such a character does not exist, return the first character in letters.
 */

/**
 * @param {character[]} letters
 * @param {character} target
 * @return {character}
 */
var nextGreatestLetter = function(letters, target) {
  return letters.find(l => l > target) || letters[0];
};
```

0745 Prefix And Suffix Search

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 745. Prefix and Suffix Search
 * https://leetcode.com/problems/prefix-and-suffix-search/
 * Difficulty: Hard
 *
 * Design a special dictionary that searches the words in it by a prefix and a suffix.
 *
 * Implement the WordFilter class:
 * - WordFilter(string[] words) Initializes the object with the words in the dictionary.
 * - f(string pref, string suff) Returns the index of the word in the dictionary, which
 *   has the prefix pref and the suffix suff. If there is more than one valid index,
 *   return the largest of them. If there is no such word in the dictionary, return -1.
 */

/**
 * @param {string[]} words
 */
var WordFilter = function(words) {
  this.map = new Map();

  for (let i = 0; i < words.length; i++) {
    let prefix = '';

    for (let j = 0; j <= words[i].length; j++) {
      let suffix = '';

      for (let k = 0; k <= words[i].length; k++) {
        suffix = words[i].slice(k);
        this.map.set(prefix + '#' + suffix, i);
      }

      prefix += words[i][j];
    }
  }
};
```

```
/**
 * @param {string} pref
 * @param {string} suff
 * @return {number}
 */
WordFilter.prototype.f = function(pref, suff) {
  const target = `${pref}#${suff}`;
  return this.map.has(target) ? this.map.get(target) : -1;
};
```

0746 Min Cost Climbing Stairs

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 746. Min Cost Climbing Stairs
 * https://leetcode.com/problems/min-cost-climbing-stairs/
 * Difficulty: Easy
 *
 * You are given an integer array cost where cost[i] is the cost of ith step on a staircase.
 * Once you pay the cost, you can either climb one or two steps.
 *
 * You can either start from the step with index 0, or the step with index 1.
 *
 * Return the minimum cost to reach the top of the floor.
 */

/**
 * @param {number[]} cost
 * @return {number}
 */
var minCostClimbingStairs = function(cost) {
  let [first, second] = cost;

  for (let index = 2; index < cost.length; index++) {
    const cursor = cost[index] + Math.min(first, second);
    first = second;
    second = cursor;
  }

  return Math.min(first, second);
};
```

0747 Largest Number At Least Twice Of Others

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 747. Largest Number At Least Twice of Others
 * https://leetcode.com/problems/largest-number-at-least-twice-of-others/
 * Difficulty: Easy
 *
 * You are given an integer array nums where the largest integer is unique.
 *
 * Determine whether the largest element in the array is at least twice as much
 * as every other number in the array. If it is, return the index of the largest
 * element, or return -1 otherwise.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var dominantIndex = function(nums) {
  const max = Math.max(...nums);
```

```
  return nums.find(n => n !== max && n > max / 2) ? -1 : nums.indexOf(max);
};
```

0748 Shortest Completing Word

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 748. Shortest Completing Word
 * https://leetcode.com/problems/shortest-completing-word/
 * Difficulty: Easy
 *
 * Given a string licensePlate and an array of strings words, find the shortest completing
 * word in words.
 *
 * A completing word is a word that contains all the letters in licensePlate. Ignore numbers
 * and spaces in licensePlate, and treat letters as case insensitive. If a letter appears more
 * than once in licensePlate, then it must appear in the word the same number of times or
more.
 *
 * For example, if licensePlate = "aBc 12c", then it contains letters 'a', 'b' (ignoring
case),
 * and 'c' twice. Possible completing words are "abccdef", "caaacab", and "cbca".
 *
 * Return the shortest completing word in words. It is guaranteed an answer exists. If there
 * are multiple shortest completing words, return the first one that occurs in words.
 */

/**
 * @param {string} licensePlate
 * @param {string[]} words
 * @return {string}
 */
var shortestCompletingWord = function(licensePlate, words) {
  const license = licensePlate.toLowerCase().replace(/[\d\s]+/g, '');
  const sortedWords = [...words].sort((a, b) => a.length - b.length);

  for (const word of sortedWords) {
    let updatedLicense = license;

    for (let i = 0; i < word.length; i++) {
      updatedLicense = updatedLicense.replace(word[i], '');
      if (!updatedLicense) {
        return word;
      }
    }
  }
};
```

0749 Contain Virus

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 749. Contain Virus
 * https://leetcode.com/problems/contain-virus/
 * Difficulty: Hard
 *
 * A virus is spreading rapidly, and your task is to quarantine the infected area by
 * installing walls.
 *
 * The world is modeled as an m x n binary grid isInfected, where isInfected[i][j] == 0
 * represents uninfected cells, and isInfected[i][j] == 1 represents cells contaminated
 * with the virus. A wall (and only one wall) can be installed between any two 4-directionally
```

```
 * adjacent cells, on the shared boundary.
 *
 * Every night, the virus spreads to all neighboring cells in all four directions unless
 * blocked by a wall. Resources are limited. Each day, you can install walls around only one
 * region (i.e., the affected area (continuous block of infected cells) that threatens the
 * most uninfected cells the following night). There will never be a tie.
 *
 * Return the number of walls used to quarantine all the infected regions. If the world will
 * become fully infected, return the number of walls used.
 */

    }
  }

  return result;
};
```

0751 Ip To Cidr

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 751. IP to CIDR
 * https://leetcode.com/problems/ip-to-cidr/
 * Difficulty: Medium
 *
 * An IP address is a formatted 32-bit unsigned integer where each group of 8 bits is printed
as
 * a decimal number and the dot character '.' splits the groups.
 * - For example, the binary number 00001111 10001000 11111111 01101011 (spaces added for
clarity)
 *   formatted as an IP address would be "15.136.255.107".
 *
```

```
 * A CIDR block is a format used to denote a specific set of IP addresses. It is a string
consisting
 * of a base IP address, followed by a slash, followed by a prefix length k. The addresses it
covers
 * are all the IPs whose first k bits are the same as the base IP address.
 * - For example, "123.45.67.89/20" is a CIDR block with a prefix length of 20. Any IP address
 whose
 *   binary representation matches 01111011 00101101 0100xxxx xxxxxxxx, where x can be either
0 or
 *   1, is in the set covered by the CIDR block.
 *
 * You are given a start IP address ip and the number of IP addresses we need to cover n. Your
 goal
 * is to use as few CIDR blocks as possible to cover all the IP addresses in the inclusive
 * range [ip, ip + n - 1] exactly. No other IP addresses outside of the range should be
covered.
 *
 * Return the shortest list of CIDR blocks that covers the range of IP addresses. If there are
 * multiple answers, return any of them.
 */

/**
 * @param {string} ip
 * @param {number} n
 * @return {string[]}
 */

      (num >>> 24) & 255,
      (num >>> 16) & 255,
      (num >>> 8) & 255,
      num & 255
    ].join('.');
  }
};
```

0752 Open The Lock

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 752. Open the Lock
 * https://leetcode.com/problems/open-the-lock/
 * Difficulty: Medium
 *
 * You have a lock in front of you with 4 circular wheels. Each wheel has 10 slots: '0', '1',
'2',
 * '3', '4', '5', '6', '7', '8', '9'. The wheels can rotate freely and wrap around: for
example
 * we can turn '9' to be '0', or '0' to be '9'. Each move consists of turning one wheel one
slot.
 *
 * The lock initially starts at '0000', a string representing the state of the 4 wheels.
 *
 * You are given a list of deadends dead ends, meaning if the lock displays any of these
codes,
 * the wheels of the lock will stop turning and you will be unable to open it.
 *
 * Given a target representing the value of the wheels that will unlock the lock, return the
 * minimum total number of turns required to open the lock, or -1 if it is impossible.
 */

/**
 * @param {string[]} deadends
 * @param {string} target
 * @return {number}
 */
var openLock = function(deadends, target) {
  const dead = new Set(deadends);
  const queue = [['0000', 0]];
  const seen = new Set(['0000']);

  if (dead.has('0000')) return -1;
  while (queue.length) {
    const [combo, turns] = queue.shift();
    if (combo === target) return turns;

    for (let i = 0; i < 4; i++) {
      const current = combo[i];
      const up = (parseInt(current) + 1) % 10;
      const down = (parseInt(current) + 9) % 10;

      const nextUp = combo.slice(0, i) + up + combo.slice(i + 1);
      if (!seen.has(nextUp) && !dead.has(nextUp)) {
        queue.push([nextUp, turns + 1]);
        seen.add(nextUp);
      }

      const nextDown = combo.slice(0, i) + down + combo.slice(i + 1);
      if (!seen.has(nextDown) && !dead.has(nextDown)) {
        queue.push([nextDown, turns + 1]);
        seen.add(nextDown);
      }
    }
  }

  return -1;
};
```

0753 Cracking The Safe

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 753. Cracking the Safe
 * https://leetcode.com/problems/cracking-the-safe/
 * Difficulty: Hard
 *
 * There is a safe protected by a password. The password is a sequence of n digits where each
 * digit can be in the range [0, k - 1].
 *
 * The safe has a peculiar way of checking the password. When you enter in a sequence, it
checks
 * the most recent n digits that were entered each time you type a digit.
 *
 * For example, the correct password is "345" and you enter in "012345":
 * - After typing 0, the most recent 3 digits is "0", which is incorrect.
 * - After typing 1, the most recent 3 digits is "01", which is incorrect.
 * - After typing 2, the most recent 3 digits is "012", which is incorrect.
 * - After typing 3, the most recent 3 digits is "123", which is incorrect.
 * - After typing 4, the most recent 3 digits is "234", which is incorrect.
 * - After typing 5, the most recent 3 digits is "345", which is correct and the safe unlocks.
 *
 * Return any string of minimum length that will unlock the safe at some point of entering it.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {string}
 */
var crackSafe = function(n, k) {
  if (n === 1) return Array.from({ length: k }, (_, i) => i).join('');

    if (sum >= absTarget && (sum - absTarget) % 2 === 0) return moves;
    moves++;
  }
};
```

0755 Pour Water

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 755. Pour Water
 * https://leetcode.com/problems/pour-water/
 * Difficulty: Medium
 *
 * You are given an elevation map represents as an integer array heights where heights[i]
 * representing the height of the terrain at index i. The width at each index is 1. You
 * are also given two integers volume and k. volume units of water will fall at index k.
 *
 * Water first drops at the index k and rests on top of the highest terrain or water at
 * that index. Then, it flows according to the following rules:
 * - If the droplet would eventually fall by moving left, then move left.
 * - Otherwise, if the droplet would eventually fall by moving right, then move right.
 * - Otherwise, rise to its current position.
 *
 * Here, "eventually fall" means that the droplet will eventually be at a lower level if
 * it moves in that direction. Also, level means the height of the terrain plus any water
 * in that column.
 *
 * We can assume there is infinitely high terrain on the two sides out of bounds of the
 * array. Also, there could not be partial water being spread out evenly on more than one
 * grid block, and each unit of water has to be in exactly one block.
 */

/**

0756 Pyramid Transition Matrix

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 756. Pyramid Transition Matrix
 * https://leetcode.com/problems/pyramid-transition-matrix/
 * Difficulty: Medium
 *
```

```
 * You are stacking blocks to form a pyramid. Each block has a color, which is represented by
 * a single letter. Each row of blocks contains one less block than the row beneath it and is
 * centered on top.
 *
 * To make the pyramid aesthetically pleasing, there are only specific triangular patterns
that
 * are allowed. A triangular pattern consists of a single block stacked on top of two blocks.
 * The patterns are given as a list of three-letter strings allowed, where the first two
characters
 * of a pattern represent the left and right bottom blocks respectively, and the third
character
 * is the top block.
 *
 * For example, "ABC" represents a triangular pattern with a 'C' block stacked on top of an
'A'
 * (left) and 'B' (right) block. Note that this is different from "BAC" where 'B' is on the
left
 * bottom and 'A' is on the right bottom.
 *
 * You start with a bottom row of blocks bottom, given as a single string, that you must use
as
 * the base of the pyramid.
 *
 * Given bottom and allowed, return true if you can build the pyramid all the way to the top
such
 * that every triangular pattern in the pyramid is in allowed, or false otherwise.
 */

/**
 * @param {string} bottom
 * @param {string[]} allowed
 * @return {boolean}
 */
var pyramidTransition = function(bottom, allowed) {
  const transitions = new Map();
  for (const [left, right, top] of allowed) {
    const key = left + right;

  }

  function canBuild(row, nextRow = '') {
    if (row.length === 1) return true;
    if (nextRow.length === row.length - 1) return canBuild(nextRow);

    const pair = row.slice(nextRow.length, nextRow.length + 2);
    const options = transitions.get(pair) || '';

    for (const top of options) {
      if (canBuild(row, nextRow + top)) return true;
    }
    return false;
  }

  return canBuild(bottom);
};
```

0757 Set Intersection Size At Least Two

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 757. Set Intersection Size At Least Two
 * https://leetcode.com/problems/set-intersection-size-at-least-two/
 * Difficulty: Hard
 *
 * You are given a 2D integer array intervals where intervals[i] = [starti, endi] represents
 * all the integers from starti to endi inclusively.
 *
 * A containing set is an array nums where each interval from intervals has at least two
 * integers in nums.
```

```
 *
 * For example, if intervals = [[1,3], [3,7], [8,9]], then [1,2,4,7,8,9] and [2,3,4,8,9]
 * are containing sets.
 *
 * Return the minimum possible size of a containing set.
 */

/**
 * @param {number[][]} intervals
 * @return {number}
 */
var intersectionSizeTwo = function(intervals) {
  intervals.sort((a, b) => a[1] - b[1] || b[0] - a[0]);

    lastEnd = end;
  }

  result += s.slice(lastEnd);

  return result;
};
```

0759 Employee Free Time

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 759. Employee Free Time
 * https://leetcode.com/problems/employee-free-time/
 * Difficulty: Hard
 *
 * We are given a list schedule of employees, which represents the working time for each
employee.
 *
 * Each employee has a list of non-overlapping Intervals, and these intervals are in sorted
order.
 *
 * Return the list of finite intervals representing common, positive-length free time for all
 * employees, also in sorted order.
 *
 * (Even though we are representing Intervals in the form [x, y], the objects inside are
Intervals,
 * not lists or arrays. For example, schedule[0][0].start = 1, schedule[0][0].end = 2, and
 * schedule[0][0][0] is not defined).  Also, we wouldn't include intervals like [5, 5] in our
 * answer, as they have zero length.
 */

/**
 * @param {Interval[][]} schedule
 * @return {Interval[]}
 */
var employeeFreeTime = function(schedule) {
  const allIntervals = [];

  for (const employee of schedule) {
    for (const interval of employee) {
      allIntervals.push(interval);
    }
  }

  allIntervals.sort((a, b) => a.start - b.start);
```

```
  const merged = [];
  for (const interval of allIntervals) {
    if (merged.length === 0 || merged[merged.length - 1].end < interval.start) {
      merged.push(interval);
    } else {

    count += s[i] === '1' ? 1 : -1;

    if (count === 0) {
      specials.push('1' + makeLargestSpecial(s.slice(start + 1, i)) + '0');
      start = i + 1;
    }
  }

  return specials.sort().reverse().join('');
}
```

0762 Prime Number Of Set Bits In Binary Representation

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 762. Prime Number of Set Bits in Binary Representation
 * https://leetcode.com/problems/prime-number-of-set-bits-in-binary-representation/
 * Difficulty: Easy
 *
 * Given two integers left and right, return the count of numbers in the inclusive range
[left, right] having
 * a prime number of set bits in their binary representation.
 *
 * Recall that the number of set bits an integer has is the number of 1's present when written
 in binary.
 *
 * For example, 21 written in binary is 10101, which has 3 set bits.
 */

/**
 * @param {number} left
 * @param {number} right
 * @return {number}
 */
var countPrimeSetBits = function(left, right) {
```

```
  const primes = new Set([2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31]);
  let result = 0;

  for (let i = left; i <= right; i++) {
    if (primes.has(i.toString(2).replace(/0+/g, '').length)) {
      result++;
    }
  }

  return result;
};
```

0763 Partition Labels

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 763. Partition Labels
 * https://leetcode.com/problems/partition-labels/
 * Difficulty: Medium
 *
 * You are given a string s. We want to partition the string into as many parts as
 * possible so that each letter appears in at most one part. For example, the
 * string "ababcc" can be partitioned into ["abab", "cc"], but partitions such as
 * ["aba", "bcc"] or ["ab", "ab", "cc"] are invalid.
 *
 * Note that the partition is done so that after concatenating all the parts in
 * order, the resultant string should be s.
 *
 * Return a list of integers representing the size of these parts.
 */

/**
 * @param {string} s
 * @return {number[]}
 */
var partitionLabels = function(s) {

 * @param {number[]} arr
 * @return {number}
 */
var maxChunksToSorted = function(arr) {
  const stack = [];

  for (const num of arr) {
    if (stack.length === 0 || stack[stack.length - 1] <= num) {
      stack.push(num);
    } else {
      const max = stack.pop();
      while (stack.length && stack[stack.length - 1] > num) {
        stack.pop();
      }
      stack.push(max);
    }
  }

  return stack.length;
};
```

0769 Max Chunks To Make Sorted

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 769. Max Chunks To Make Sorted
 * https://leetcode.com/problems/max-chunks-to-make-sorted/
 * Difficulty: Medium
 *
 * You are given an integer array arr of length n that represents a permutation of the
integers
 * in the range [0, n - 1].
 *
 * We split arr into some number of chunks (i.e., partitions), and individually sort each
chunk.
 * After concatenating them, the result should equal the sorted array.
 *
 * Return the largest number of chunks we can make to sort the array.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
var maxChunksToSorted = function(arr) {
  let result = 0;

  for (let i = 0, max = 0; i < arr.length; i++) {
    max = Math.max(max, arr[i]);
    if (max === i) {
      result++;
    }
  }

  return result;
};
```

0770 Basic Calculator Iv

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 770. Basic Calculator IV
 * https://leetcode.com/problems/basic-calculator-iv/
 * Difficulty: Hard
 *
 * Given an expression such as expression = "e + 8 - a + 5" and an evaluation map such as
{"e": 1}
 * (given in terms of evalvars = ["e"] and evalints = [1]), return a list of tokens
representing
 * the simplified expression, such as ["-1*a","14"]
 * - An expression alternates chunks and symbols, with a space separating each chunk and
symbol.
 * - A chunk is either an expression in parentheses, a variable, or a non-negative integer.
 * - A variable is a string of lowercase letters (not including digits.) Note that variables
can
 *   be multiple letters, and note that variables never have a leading coefficient or unary
operator
 *   like "2x" or "-x".
 *
 * Expressions are evaluated in the usual order: brackets first, then multiplication, then
addition
 * and subtraction.
 *
 * - For example, expression = "1 + 2 * 3" has an answer of ["7"].
 *
 * The format of the output is as follows:
 * - For each term of free variables with a non-zero coefficient, we write the free variables
within
 *   a term in sorted order lexicographically.
 *   - For example, we would never write a term like "b*a*c", only "a*b*c".
 * - Terms have degrees equal to the number of free variables being multiplied, counting
 *   multiplicity. We write the largest degree terms of our answer first, breaking ties by
 *   lexicographic order ignoring the leading coefficient of the term.
 *   - For example, "a*a*b*c" has degree 4.
 * - The leading coefficient of the term is placed directly to the left with an asterisk
separating
 *   it from the variables (if they exist.) A leading coefficient of 1 is still printed.
 * - An example of a well-formatted answer is ["-2*a*a*a", "3*a*a*b", "3*b*b", "4*a", "5*c",
"-6"].
 * - Terms (including constant terms) with coefficient 0 are not included.
 *   - For example, an expression of "0" has an output of [].
 *
 * Note: You may assume that the given expression is always valid. All intermediate results
will be
 * in the range of [-231, 231 - 1].

```

0785 Is Graph Bipartite

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 785. Is Graph Bipartite?
 * https://leetcode.com/problems/is-graph-bipartite/
 * Difficulty: Medium
 *
 * There is an undirected graph with n nodes, where each node is numbered between 0 and n - 1.
 * You are given a 2D array graph, where graph[u] is an array of nodes that node u is adjacent
```

```
 * to. More formally, for each v in graph[u], there is an undirected edge between node u and
 * node v. The graph has the following properties:
 * - There are no self-edges (graph[u] does not contain u).
 * - There are no parallel edges (graph[u] does not contain duplicate values).
 * - If v is in graph[u], then u is in graph[v] (the graph is undirected).
 * - The graph may not be connected, meaning there may be two nodes u and v such that there is
 *   no path between them.
 *
 * A graph is bipartite if the nodes can be partitioned into two independent sets A and B such
 * that every edge in the graph connects a node in set A and a node in set B.
 *
 * Return true if and only if it is bipartite.
 */

0789 Escape The Ghosts

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 789. Escape The Ghosts
 * https://leetcode.com/problems/escape-the-ghosts/
 * Difficulty: Medium
 *
 * You are playing a simplified PAC-MAN game on an infinite 2-D grid. You start at the point
 * [0, 0], and you are given a destination point target = [xtarget, ytarget] that you are
trying
 * to get to. There are several ghosts on the map with their starting positions given as a 2D
 * array ghosts, where ghosts[i] = [xi, yi] represents the starting position of the ith ghost.
 * All inputs are integral coordinates.
 *
 * Each turn, you and all the ghosts may independently choose to either move 1 unit in any of
 * the four cardinal directions: north, east, south, or west, or stay still. All actions
happen
 * simultaneously.
 *
 * You escape if and only if you can reach the target before any ghost reaches you. If you
reach
 * any square (including the target) at the same time as a ghost, it does not count as an
escape.
 *
 * Return true if it is possible to escape regardless of how the ghosts move, otherwise return
 * false.
 */

0799 Champagne Tower

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 799. Champagne Tower
 * https://leetcode.com/problems/champagne-tower/
 * Difficulty: Medium
 *
 * We stack glasses in a pyramid, where the first row has 1 glass, the second row has 2
glasses, and
 * so on until the 100th row. Each glass holds one cup of champagne.
 *
 * Then, some champagne is poured into the first glass at the top. When the topmost glass is
full,
 * any excess liquid poured will fall equally to the glass immediately to the left and right
of it.
 * When those glasses become full, any excess champagne will fall equally to the left and
right of
 * those glasses, and so on. (A glass at the bottom row has its excess champagne fall on the
 * floor.)
 *
 * For example, after one cup of champagne is poured, the top most glass is full. After two
cups
 * of champagne are poured, the two glasses on the second row are half full. After three cups
of
 * champagne are poured, those two cups become full - there are 3 full glasses total now.
After
 * four cups of champagne are poured, the third row has the middle glass half full, and the
two
 * outside glasses are a quarter full, as pictured below.
 */

/**
 * @param {number} poured
 * @param {number} queryRow
 * @param {number} queryGlass
 * @return {number}
 */
var champagneTower = function(poured, queryRow, queryGlass) {
  const tower = new Array(101).fill().map(() => new Array(101).fill(0));
  tower[0][0] = poured;

  for (let row = 0; row <= queryRow; row++) {
    for (let glass = 0; glass <= row; glass++) {
```

```
      const excess = (tower[row][glass] - 1) / 2;

      if (excess > 0) {
        tower[row + 1][glass] += excess;
        tower[row + 1][glass + 1] += excess;
      }
    }
  }

  return Math.min(1, tower[queryRow][queryGlass]);
};
```

0800 Similar Rgb Color

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 800. Similar RGB Color
 * https://leetcode.com/problems/similar-rgb-color/
 * Difficulty: Easy
 *
 * The red-green-blue color "#AABBCC" can be written as "#ABC" in shorthand.
 * - For example, "#15c" is shorthand for the color "#1155cc".
 *
 * The similarity between the two colors "#ABCDEF" and "#UVWXYZ"
 * is -(AB - UV)2 - (CD - WX)2 - (EF - YZ)2.
 *
 * Given a string color that follows the format "#ABCDEF", return a string represents
 * the color that is most similar to the given color and has a shorthand (i.e., it can
 * be represented as some "#XYZ").
 *
 * Any answer which has the same highest similarity as the best answer will be accepted.
 */

/**
 * @param {string} color
 * @return {string}
 */
var similarRGB = function(color) {
  const shorthandValues = [
    '00', '11', '22', '33', '44', '55', '66', '77',
    '88', '99', 'aa', 'bb', 'cc', 'dd', 'ee', 'ff'
  ];

  const red = helper(color.slice(1, 3));
  const green = helper(color.slice(3, 5));

      }
    }

    return closest;
  }
};
```

0801 Minimum Swaps To Make Sequences Increasing

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 801. Minimum Swaps To Make Sequences Increasing
 * https://leetcode.com/problems/minimum-swaps-to-make-sequences-increasing/
 * Difficulty: Hard
 *
 * You are given two integer arrays of the same length nums1 and nums2. In one operation, you
are
 * allowed to swap nums1[i] with nums2[i].
 *
 * For example, if nums1 = [1,2,3,8], and nums2 = [5,6,7,4], you can swap the element at i = 3
 to
 * obtain nums1 = [1,2,3,4] and nums2 = [5,6,7,8].
 *
 * Return the minimum number of needed operations to make nums1 and nums2 strictly increasing.
 The
 * test cases are generated so that the given input always makes it possible.
 *
 * An array arr is strictly increasing if and only if
 * arr[0] < arr[1] < arr[2] < ... < arr[arr.length - 1].
 */

/**
 * @param {number[]} nums1
 * @param {number[]} nums2
 * @return {number}
 */

    swap = nextSwap;
  }

  return Math.min(noSwap, swap);
};
```

0802 Find Eventual Safe States

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 802. Find Eventual Safe States
 * https://leetcode.com/problems/find-eventual-safe-states/
```

```
 * Difficulty: Medium
 *
 * There is a directed graph of n nodes with each node labeled from 0 to n - 1. The graph is
 * represented by a 0-indexed 2D integer array graph where graph[i] is an integer array of
 * nodes adjacent to node i, meaning there is an edge from node i to each node in graph[i].
 *
 * A node is a terminal node if there are no outgoing edges. A node is a safe node if every
 * possible path starting from that node leads to a terminal node (or another safe node).
 *
 * Return an array containing all the safe nodes of the graph. The answer should be sorted
 * in ascending order.
 */

/**
 * @param {number[][]} graph
 * @return {number[]}
 */
var eventualSafeNodes = function(graph) {
  const nodes = graph.map(() => []);
  const totals = graph.map(n => n.length);
  const queue = totals.map((v, i) => v ? -1 : i).filter(v => v >= 0);
  const result = [];

  graph.forEach((n, i) => n.forEach(v => nodes[v].push(i)));

  while (queue.length) {
    const node = queue.shift();
    result.push(node);
    nodes[node].forEach(v => !--totals[v] && queue.push(v));
  }

  return result.sort((a, b) => a - b);
};
```

0803 Bricks Falling When Hit

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 803. Bricks Falling When Hit
 * https://leetcode.com/problems/bricks-falling-when-hit/
 * Difficulty: Hard
 *
 * You are given an m x n binary grid, where each 1 represents a brick and 0 represents an
empty
 * space. A brick is stable if:
 * - It is directly connected to the top of the grid, or
 * - At least one other brick in its four adjacent cells is stable.
 *
 * You are also given an array hits, which is a sequence of erasures we want to apply. Each
time
 * we want to erase the brick at the location hits[i] = (rowi, coli). The brick on that
location
 * (if it exists) will disappear. Some other bricks may no longer be stable because of that
erasure
 * and will fall. Once a brick falls, it is immediately erased from the grid (i.e., it does
not
 * land on other stable bricks).
 *
 * Return an array result, where each result[i] is the number of bricks that will fall after
the
 * ith erasure is applied.
 *
 * Note that an erasure may refer to a location with no brick, and if it does, no bricks drop.
 */

/**
 * @param {number[][]} grid
 * @param {number[][]} hits
 * @return {number[]}
```

```
 */
var hitBricks = function(grid, hits) {
  const rows = grid.length;
  const cols = grid[0].length;
  const directions = [[1, 0], [-1, 0], [0, 1], [0, -1]];
  const fallenBricks = new Array(hits.length).fill(0);

  hits.forEach(([x, y]) => {
    if (grid[x][y] === 1) grid[x][y] = 2;
  });

  for (let col = 0; col < cols; col++) markStableBricks(0, col, grid);

  for (let i = hits.length - 1; i >= 0; i--) {
    const [x, y] = hits[i];
    if (grid[x][y] !== 2) continue;

    grid[x][y] = 1;
    if (hasStableNeighbor(x, y, grid)) {
      fallenBricks[i] = markStableBricks(x, y, grid) - 1;
    }
  }

  return fallenBricks;

  function markStableBricks(x, y, grid) {
    if (x < 0 || x >= rows || y < 0 || y >= cols || grid[x][y] !== 1) return 0;

    grid[x][y] = 3;
    return 1 + directions.reduce((count, [dx, dy]) => {
      return count + markStableBricks(x + dx, y + dy, grid);

  }

  function hasStableNeighbor(x, y, grid) {
    if (x === 0) return true;

    return directions.some(([dx, dy]) => {
      const newX = x + dx;
      const newY = y + dy;
      return newX >= 0 && newX < rows && newY >= 0 && newY < cols && grid[newX][newY] === 3;
    });
  }
};
```

0804 Unique Morse Code Words

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 804. Unique Morse Code Words
 * https://leetcode.com/problems/unique-morse-code-words/
 * Difficulty: Easy
 *
 * International Morse Code defines a standard encoding where
 * each letter is mapped to a series of dots and dashes, as
 * follows: "a" maps to ".-", "b" maps to "-...",
 * "c" maps to "-.-.", and so on.
 *
 * For convenience, the full table for the 26 letters of the
 * English alphabet is given below:
 *
 * [".-","-...","-.-.","-..",".","..-.","--.","....","..",
 * ".---","-.-",".-..","--","-.","---",".--.","--.-",".-.",
 * "...","-","..-","...-",".--","-..-","-.--","--.."]
 *
 * Now, given a list of words, each word can be written as a
 * concatenation of the Morse code of each letter.
 * For example, "cba" can be written as "-.-..--...",
 * (which is the concatenation "-.-." + "-..." + ".-").
```

```
 * We'll call such a concatenation, the transformation of a word.
 *
 * Return the number of different transformations
 * among all words we have.
 */

/**
 * @param {string[]} words
 * @return {number}
 */
var uniqueMorseRepresentations = function(words) {
  const codes = [".-","-...","-.-.","-..",".","..-.","--.","....","..",".---",
                 "-.-",".-..","--","-.","---",".--.","--.-",".-.","...","-",
                 "..-","...-",".--","-..-","-.--","--.."];
  const map = new Map(codes.map((v, i) => [String.fromCharCode(97 + i), v]));
  const transformed = words.map(word => word.split('').map(c => map.get(c)).join(''));
  return new Set(transformed).size;
};
```

0805 Split Array With Same Average

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 805. Split Array With Same Average
 * https://leetcode.com/problems/split-array-with-same-average/
 * Difficulty: Hard
 *
 * You are given an integer array nums.
 *
 * You should move each element of nums into one of the two arrays A and B such that A and B
are
 * non-empty, and average(A) == average(B).
 *
 * Return true if it is possible to achieve that and false otherwise.
 *
 * Note that for an array arr, average(arr) is the sum of all the elements of arr over the
length
 * of arr.
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */
var splitArraySameAverage = function(nums) {
  if (nums.length <= 1) return false;
  const sum = nums.reduce((acc, num) => acc + num, 0);
  const dp = Array(Math.floor(nums.length / 2) + 1).fill().map(() => new Set());
  dp[0].add(0);

  for (const num of nums) {
    for (let size = Math.min(Math.floor(nums.length / 2), dp.length - 1); size > 0; size--) {
      for (const prevSum of dp[size - 1]) {
        dp[size].add(prevSum + num);
      }
    }
  }

  for (let size = 1; size <= Math.floor(nums.length / 2); size++) {
    const targetSum = sum * size / nums.length;

    if (targetSum % 1 === 0 && dp[size].has(targetSum)) {
      return true;
    }
  }

  return false;
};
```

0806 Number Of Lines To Write String

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 806. Number of Lines To Write String
 * https://leetcode.com/problems/number-of-lines-to-write-string/
 * Difficulty: Easy
 *
 * You are given a string s of lowercase English letters and an array widths denoting how many
 * pixels wide each lowercase English letter is. Specifically, widths[0] is the width of 'a',
 * widths[1] is the width of 'b', and so on.
 *
 * You are trying to write s across several lines, where each line is no longer than 100
pixels.
 * Starting at the beginning of s, write as many letters on the first line such that the total
 * width does not exceed 100 pixels. Then, from where you stopped in s, continue writing as
many
 * letters as you can on the second line. Continue this process until you have written all of
s.
 *
 * Return an array result of length 2 where:
 * - result[0] is the total number of lines.
 * - result[1] is the width of the last line in pixels.
 */

/**
 * @param {number[]} widths
 * @param {string} s
 * @return {number[]}
 */
var numberOfLines = function(widths, s) {

    if (width + charWidth > 100) {
      lines++;
      width = charWidth;
    } else {
      width += charWidth;
    }
  }

  return [lines, width];
};
```

0807 Max Increase To Keep City Skyline

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 807. Max Increase to Keep City Skyline
 * https://leetcode.com/problems/max-increase-to-keep-city-skyline/
 * Difficulty: Medium
 *
 * There is a city composed of n x n blocks, where each block contains a single building
shaped
 * like a vertical square prism. You are given a 0-indexed n x n integer matrix grid where
 * grid[r][c] represents the height of the building located in the block at row r and column
c.
 *
 * A city's skyline is the outer contour formed by all the building when viewing the side of
```

```
the
 * city from a distance. The skyline from each cardinal direction north, east, south, and west
 * may be different.
 *
 * We are allowed to increase the height of any number of buildings by any amount (the amount
can
 * be different per building). The height of a 0-height building can also be increased.
However,
 * increasing the height of a building should not affect the city's skyline from any cardinal
 * direction.
 *
 * Return the maximum total sum that the height of the buildings can be increased by without
 * changing the city's skyline from any cardinal direction.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var maxIncreaseKeepingSkyline = function(grid) {
  let result = 0;
  const rowMaxes = grid.map(row => Math.max(...row));
  const columnMaxes = grid.map((row, index) => grid.map(row => row[index]))
    .map(row => Math.max(...row));

  for (let i = 0; i < grid.length; i++) {
    for (let j = 0; j < grid[i].length; j++) {
      const currentHeight = grid[i][j];
      const minHeight = Math.min(
        Math.max(rowMaxes[i], currentHeight),
        Math.max(columnMaxes[j], currentHeight)
      );

      result += (minHeight - currentHeight);
    }
  }

  return result;

```

0808 Soup Servings

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 808. Soup Servings
 * https://leetcode.com/problems/soup-servings/
 * Difficulty: Medium
 *
 * There are two types of soup: type A and type B. Initially, we have n ml of each type of
soup.
 * There are four kinds of operations:
 * 1. Serve 100 ml of soup A and 0 ml of soup B,
 * 2. Serve 75 ml of soup A and 25 ml of soup B,
 * 3. Serve 50 ml of soup A and 50 ml of soup B, and
 * 4. Serve 25 ml of soup A and 75 ml of soup B.
 *
 * When we serve some soup, we give it to someone, and we no longer have it. Each turn, we
will
 * choose from the four operations with an equal probability 0.25. If the remaining volume of
 * soup is not enough to complete the operation, we will serve as much as possible. We stop
once
 * we no longer have some quantity of both types of soup.
 *
 * Note that we do not have an operation where all 100 ml's of soup B are used first.
 *
 * Return the probability that soup A will be empty first, plus half the probability that A
and B
 * become empty at the same time. Answers within 10-5 of the actual answer will be accepted.
 */
```

```
/**
 * @param {number} n
 * @return {number}
 */

      calculateProbability(a - 4, b) + calculateProbability(a - 3, b - 1)
      + calculateProbability(a - 2, b - 2) + calculateProbability(a - 1, b - 3)
    );

    memo.set(key, probability);
    return probability;
  }

  return calculateProbability(n, n);
};
```

0809 Expressive Words

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 809. Expressive Words
 * https://leetcode.com/problems/expressive-words/
 * Difficulty: Medium
 *
 * Sometimes people repeat letters to represent extra feeling. For example:
 * - "hello" -> "heeellooo"
 * - "hi" -> "hiiii"
 *
 * In these strings like "heeellooo", we have groups of adjacent letters that are all the
 * same: "h", "eee", "ll", "ooo".
 *
 * You are given a string s and an array of query strings words. A query word is stretchy
 * if it can be made to be equal to s by any number of applications of the following extension
 * operation: choose a group consisting of characters c, and add some number of characters
 * c to the group so that the size of the group is three or more.
 *
 * For example, starting with "hello", we could do an extension on the group "o" to get
 * "hellooo", but we cannot get "helloo" since the group "oo" has a size less than three.
 * Also, we could do another extension like "ll" -> "lllll" to get "helllllooo". If
 * s = "helllllooo", then the query word "hello" would be stretchy because of these two
 * extension operations: query = "hello" -> "hellooo" -> "helllllooo" = s.
 *
 * Return the number of query strings that are stretchy.
 */

/**
 * @param {string} s
 * @param {string[]} words
 * @return {number}
 */
var expressiveWords = function(s, words) {
  let result = 0;

  for (const word of words) {
```

```

0810 Chalkboard Xor Game

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 810. Chalkboard XOR Game
 * https://leetcode.com/problems/chalkboard-xor-game/
 * Difficulty: Hard
 *
 * You are given an array of integers nums represents the numbers written on a chalkboard.
 *
 * Alice and Bob take turns erasing exactly one number from the chalkboard, with Alice
starting
 * first. If erasing a number causes the bitwise XOR of all the elements of the chalkboard to
 * become 0, then that player loses. The bitwise XOR of one element is that element itself,
and
 * the bitwise XOR of no elements is 0.
 *
 * Also, if any player starts their turn with the bitwise XOR of all the elements of the
chalkboard
 * equal to 0, then that player wins.
 *
 * Return true if and only if Alice wins the game, assuming both players play optimally.
 */

/**
 * @param {number[]} nums
 * @return {boolean}
 */
var xorGame = function(nums) {
  const total = nums.reduce((xor, num) => xor ^ num, 0);
  if (total === 0) return true;
  return nums.length % 2 === 0;
```

```
};

      }
    }
  }

  return -1;
};
```

0816 Ambiguous Coordinates

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 816. Ambiguous Coordinates
 * https://leetcode.com/problems/ambiguous-coordinates/
 * Difficulty: Medium
 *
 * We had some 2-dimensional coordinates, like "(1, 3)" or "(2, 0.5)". Then, we removed all
commas,
 * decimal points, and spaces and ended up with the string s.
 * - For example, "(1, 3)" becomes s = "(13)" and "(2, 0.5)" becomes s = "(205)".
 *
 * Return a list of strings representing all possibilities for what our original coordinates
could
 * have been.
 *
 * Our original representation never had extraneous zeroes, so we never started with numbers
like
 * "00", "0.0", "0.00", "1.0", "001", "00.01", or any other number that can be represented
with
 * fewer digits. Also, a decimal point within a number never occurs without at least one digit
 * occurring before it, so we never started with numbers like ".1".
 *
 * The final answer list can be returned in any order. All coordinates in the final answer
have
 * exactly one space between them (occurring after the comma.)
 */

/**
 * @param {string} s
 * @return {string[]}
 */
var ambiguousCoordinates = function(s) {

    } else {
      inComponent = false;
    }
    current = current.next;
  }

  return componentCount;
};
```

0818 Race Car

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 818. Race Car
 * https://leetcode.com/problems/race-car/
 * Difficulty: Hard
 *
 * Your car starts at position 0 and speed +1 on an infinite number line. Your car can go into
 * negative positions. Your car drives automatically according to a sequence of instructions
 * 'A' (accelerate) and 'R' (reverse):
 * - When you get an instruction 'A', your car does the following:
 *   - position += speed
 *   - speed *= 2
 * - When you get an instruction 'R', your car does the following:
 *   - If your speed is positive then speed = -1
 *   - otherwise speed = 1
 *
 * Your position stays the same.
 *
 * For example, after commands "AAR", your car goes to positions 0 --> 1 --> 3 --> 3, and your
 * speed goes to 1 --> 2 --> 4 --> -1.
 *
 * Given a target position target, return the length of the shortest sequence of instructions
 * to get there.
 */

/**
 * @param {number} target
 * @return {number}
 */

};
```

0824 Goat Latin

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 824. Goat Latin
 * https://leetcode.com/problems/goat-latin/
 * Difficulty: Easy
 *
 * A sentence S is given, composed of words separated by spaces.
 * Each word consists of lowercase and uppercase letters only.
 *
 * We would like to convert the sentence to "Goat Latin"
 * (a made-up language similar to Pig Latin.)
 *
 * The rules of Goat Latin are as follows:
 * - If a word begins with a vowel (a, e, i, o, or u), append "ma" to the
 *   end of the word. For example, the word 'apple' becomes 'applema'.
 * - If a word begins with a consonant (i.e. not a vowel), remove the
 *   first letter and append it to the end, then add "ma".
 *   For example, the word "goat" becomes "oatgma".
 * - Add one letter 'a' to the end of each word per its word index in
 *   the sentence, starting with 1.
 *   For example, the first word gets "a" added to the end, the second word gets
 *   "aa" added to the end and so on.
 *
 * Return the final sentence representing the conversion from S to Goat Latin.
 */

/**
 * @param {string} S
 * @return {string}
 */
var toGoatLatin = function(S) {
  return S.split(' ').map((word, index) => {
    return `${word.replace(/^([^aeiou])(.*)/ig, '$2$1')}ma${'a'.repeat(index + 1)}`;
  }).join(' ');
};
```

0825 Friends Of Appropriate Ages

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 825. Friends Of Appropriate Ages
 * https://leetcode.com/problems/friends-of-appropriate-ages/
 * Difficulty: Medium
 *
 * There are n persons on a social media website. You are given an integer array ages where
ages[i]
 * is the age of the ith person.
 *
 * A Person x will not send a friend request to a person y (x != y) if any of the following
 * conditions is true:
 * - age[y] <= 0.5 * age[x] + 7
```

```
 * - age[y] > age[x]
 * - age[y] > 100 && age[x] < 100
 *
 * Otherwise, x will send a friend request to y.
 *
 * Note that if x sends a request to y, y will not necessarily send a request to x. Also, a
person
 * will not send a friend request to themself.
 *
 * Return the total number of friend requests made.
 */

/**
 * @param {number[]} ages
 * @return {number}
 */

0828 Count Unique Characters Of All Substrings Of A Given String

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 828. Count Unique Characters of All Substrings of a Given String
 * https://leetcode.com/problems/count-unique-characters-of-all-substrings-of-a-given-string/
 * Difficulty: Hard
 *
 * Let's define a function countUniqueChars(s) that returns the number of unique characters in
 s.
 * - For example, calling countUniqueChars(s) if s = "LEETCODE" then "L", "T", "C", "O", "D"
are
 *   the unique characters since they appear only once in s, therefore countUniqueChars(s) =
5.
 *
 * Given a string s, return the sum of countUniqueChars(t) where t is a substring of s. The
test
 * cases are generated such that the answer fits in a 32-bit integer.
 *
 * Notice that some substrings can be repeated so in this case you have to count the repeated
 * ones too.
 */

/**
 * @param {string} s
 * @return {number}
 */
var uniqueLetterString = function(s) {
  const n = s.length;
  const lastPositions = {};
  let result = 0;

  for (let i = 0; i < n; i++) {
    const char = s[i];
    if (!lastPositions[char]) lastPositions[char] = [-1, -1];

    const [prevPrev, prev] = lastPositions[char];
    result += (i - prev) * (prev - prevPrev);
    lastPositions[char] = [prev, i];
  }
```

```
  for (const char of Object.keys(lastPositions)) {
    const [prev, pos] = lastPositions[char];
    if (pos >= 0) result += (n - pos) * (pos - prev);
  }

  return result;
};
```

0829 Consecutive Numbers Sum

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 829. Consecutive Numbers Sum
 * https://leetcode.com/problems/consecutive-numbers-sum/
 * Difficulty: Hard
 *
 * Given an integer n, return the number of ways you can write n as the sum of consecutive
 * positive integers.
 */

/**
 * @param {number} n
 * @return {number}
 */
var consecutiveNumbersSum = function(n) {
  let result = 0;

  for (let k = 1; k < Math.sqrt(2 * n); k++) {
    const numerator = n - (k * (k - 1)) / 2;
    if (numerator % k === 0) {
      const startingNum = numerator / k;
      if (startingNum > 0) {
        result++;
      }
    }
  }

  return result;
};
```

0830 Positions Of Large Groups

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 830. Positions of Large Groups
 * https://leetcode.com/problems/positions-of-large-groups/
 * Difficulty: Easy
 *
 * In a string s of lowercase letters, these letters form consecutive groups of the same
character.
 *
 * For example, a string like s = "abbxxxxzyy" has the groups "a", "bb", "xxxx", "z", and
"yy".
 *
 * A group is identified by an interval [start, end], where start and end denote the start and
 end
 * indices (inclusive) of the group. In the above example, "xxxx" has the interval [3,6].
 *
 * A group is considered large if it has 3 or more characters.
 *
 * Return the intervals of every large group sorted in increasing order by start index.
 */
```

```
/**
 * @param {string} s
 * @return {number[][]}
 */
var largeGroupPositions = function(s) {
  const result = [];
  let start = 0;

  for (let i = 1; i <= s.length; i++) {
    if (s.length === i || s[i] !== s[start]) {
      if (i - start >= 3) {
        result.push([start, i - 1]);
      }
      start = i;
    }
  }

  return result;
};
```

0831 Masking Personal Information

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 831. Masking Personal Information
 * https://leetcode.com/problems/masking-personal-information/
 * Difficulty: Medium
 *
 * We are given a personal information string S, which may represent either an email address
or a phone number.
 * We would like to mask this personal information according to the following rules:
 * 1. Email address:
 * We define a name to be a string of length ≥ 2 consisting of only lowercase letters a-z or
uppercase letters A-Z.
 * An email address starts with a name, followed by the symbol '@', followed by a name,
followed by the dot '.' and
 * followed by a name. All email addresses are guaranteed to be valid and in the format of
"name1@name2.name3".
 * To mask an email, all names must be converted to lowercase and all letters between the
first and last letter of
 * the first name must be replaced by 5 asterisks '*'.
 *
 * 2. Phone number:
 * A phone number is a string consisting of only the digits 0-9 or the characters from the set
 * {'+', '-', '(', ')', ' '}. You may assume a phone number contains 10 to 13 digits. The last
 10 digits make up the
 * local number, while the digits before those make up the country code. Note that the country
 code is optional. We
 * want to expose only the last 4 digits and mask all other digits. The local number should be
 formatted and masked
 * as "***-***-1111", where 1 represents the exposed digits. To mask a phone number with
country code like
 * "+111 111 111 1111", we write it in the form "+***-***-***-1111".  The '+' sign and the
first '-' sign before the
 * local number should only exist if there is a country code.  For example, a 12 digit phone
number mask should start
 * with "+**-". Note that extraneous characters like "(", ")", " ", as well as extra dashes or
 plus signs not part of
 * the above formatting scheme should be removed.
 *
 * Return the correct "mask" of the information provided.
 */

// The one-line solution:
/**
 * @param {string} S
 * @return {string}
 */
var maskPII = function(S) {
```

```
  return S.toLowerCase()
    .replace(/^([a-z])[a-z]*([a-z])/, '$1*****$2')
    .replace(/[)(\-\s+]+/g, '')
    .replace(/^(\d*)(\d{3})(\d{3})(\d{4})$/, '+$1-$2-$3-$4')
    .replace(/\d(?!\d{0,3}$)/g, '*')
    .replace(/^\+\-/, '');
};

// More readable alternative:
/**
 * @param {string} S
 * @return {string}
 */
var maskPII = function(S) {
  if (S.includes('@')) {
    return S.toLowerCase().replace(/^(\w)\w*(\w)/, '$1*****$2');
  } else {
    return S.replace(/\D+/g, '')
      .replace(/^(\d*)(\d{3})(\d{3})(\d{4})$/, '+$1-$2-$3-$4')
      .replace(/\d(?!\d{0,3}$)/g, '*')
      .replace(/^\+\-/, '');
  }
};
```

0832 Flipping An Image

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 832. Flipping an Image
 * https://leetcode.com/problems/flipping-an-image/
 * Difficulty: Easy
 *
 * Given an n x n binary matrix image, flip the image horizontally, then invert it, and
 * return the resulting image.
 *
 * To flip an image horizontally means that each row of the image is reversed.
 * - For example, flipping [1,1,0] horizontally results in [0,1,1].
 *
 * To invert an image means that each 0 is replaced by 1, and each 1 is replaced by 0.
 * - For example, inverting [0,1,1] results in [1,0,0].
 */

/**
 * @param {number[][]} image
 * @return {number[][]}
 */
var flipAndInvertImage = function(image) {
  return image.map(row => row.reverse().map(num => 1 ^ num));
};
```

0833 Find And Replace In String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 833. Find And Replace in String
 * https://leetcode.com/problems/find-and-replace-in-string/
 * Difficulty: Medium
 *
 * You are given a 0-indexed string s that you must perform k replacement operations on.
 * The replacement operations are given as three 0-indexed parallel arrays, indices, sources,
 * and targets, all of length k.
 *
 * To complete the ith replacement operation:
```

```
 * 1. Check if the substring sources[i] occurs at index indices[i] in the original string s.
 * 2. If it does not occur, do nothing.
 * 3. Otherwise if it does occur, replace that substring with targets[i].
 *
 * For example, if s = "abcd", indices[i] = 0, sources[i] = "ab", and targets[i] = "eee", then
 * the result of this replacement will be "eeecd".
 *
 * All replacement operations must occur simultaneously, meaning the replacement operations
should
 * not affect the indexing of each other. The testcases will be generated such that the
replacements
 * will not overlap.
 *
 * - For example, a testcase with s = "abc", indices = [0, 1], and sources = ["ab","bc"] will
not be
 *   generated because the "ab" and "bc" replacements overlap.
 *
 * Return the resulting string after performing all replacement operations on s.
 *
 * A substring is a contiguous sequence of characters in a string.
 */

/**
 * @param {string} s
 * @param {number[]} indices
 * @param {string[]} sources
 * @param {string[]} targets
 * @return {string}
 */
var findReplaceString = function(s, indices, sources, targets) {
  const replacements = [];

  for (let i = 0; i < indices.length; i++) {
    const index = indices[i];
    const source = sources[i];
    const target = targets[i];

    if (s.substring(index, index + source.length) === source) {
      replacements.push({ index, source, target });
    }
  }

  replacements.sort((a, b) => b.index - a.index);

  let result = s;
  for (const { index, source, target } of replacements) {
    result = result.substring(0, index) + target + result.substring(index + source.length);
  }

  return result;
};
```

0834 Sum Of Distances In Tree

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 834. Sum of Distances in Tree
 * https://leetcode.com/problems/sum-of-distances-in-tree/
 * Difficulty: Hard
 *
 * There is an undirected connected tree with n nodes labeled from 0 to n - 1 and n - 1 edges.
 *
 * You are given the integer n and the array edges where edges[i] = [ai, bi] indicates that
there
 * is an edge between nodes ai and bi in the tree.
 *
 * Return an array answer of length n where answer[i] is the sum of the distances between the
ith
 * node in the tree and all other nodes.
```

```
 */

/**
 * @param {number} n
 * @param {number[][]} edges
 * @return {number[]}
 */
var sumOfDistancesInTree = function(n, edges) {
  const graph = Array.from({ length: n }, () => []);
  const count = new Array(n).fill(1);
  const result = new Array(n).fill(0);

  for (const [a, b] of edges) {
    graph[a].push(b);
    graph[b].push(a);
  }

  function dfs1(node, parent) {
    for (const child of graph[node]) {
      if (child !== parent) {
        dfs1(child, node);
        count[node] += count[child];
        result[node] += result[child] + count[child];
      }
    }
  }

  function dfs2(node, parent) {
    for (const child of graph[node]) {
      if (child !== parent) {
        result[child] = result[node] - count[child] + (n - count[child]);
        dfs2(child, node);
      }
    }
  }

  dfs1(0, -1);
  dfs2(0, -1);

  return result;
};
```

0835 Image Overlap

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 835. Image Overlap
 * https://leetcode.com/problems/image-overlap/
 * Difficulty: Medium
 *
 * You are given two images, img1 and img2, represented as binary, square matrices of size n x
 n.
 * A binary matrix has only 0s and 1s as values.
 *
 * We translate one image however we choose by sliding all the 1 bits left, right, up, and/or
down
 * any number of units. We then place it on top of the other image. We can then calculate the
 * overlap by counting the number of positions that have a 1 in both images.
 *
 * Note also that a translation does not include any kind of rotation. Any 1 bits that are
 * translated outside of the matrix borders are erased.
 *
 * Return the largest possible overlap.
 */

/**
 * @param {number[][]} img1
 * @param {number[][]} img2
 * @return {number}
```

```
 */
var largestOverlap = function(img1, img2) {
  const positions1 = [];
  const positions2 = [];

  for (let i = 0; i < img1.length; i++) {

  }

  const translations = new Map();
  let maxOverlap = 0;

  for (const [r1, c1] of positions1) {
    for (const [r2, c2] of positions2) {
      const translation = `${r2 - r1},${c2 - c1}`;

      if (!translations.has(translation)) {
        translations.set(translation, 0);
      }

      translations.set(translation, translations.get(translation) + 1);
      maxOverlap = Math.max(maxOverlap, translations.get(translation));
    }
  }

  return maxOverlap;
};
```

0836 Rectangle Overlap

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 836. Rectangle Overlap
 * https://leetcode.com/problems/rectangle-overlap/
 * Difficulty: Easy
 *
 * An axis-aligned rectangle is represented as a list [x1, y1, x2, y2], where (x1, y1) is the
 * coordinate of its bottom-left corner, and (x2, y2) is the coordinate of its top-right
corner.
 * Its top and bottom edges are parallel to the X-axis, and its left and right edges are
parallel
 * to the Y-axis.
 *
 * Two rectangles overlap if the area of their intersection is positive. To be clear, two
rectangles
 * that only touch at the corner or edges do not overlap.
 *
 * Given two axis-aligned rectangles rec1 and rec2, return true if they overlap, otherwise
return
 * false.
 */

/**
 * @param {number[]} rec1
 * @param {number[]} rec2
 * @return {boolean}
 */

  for (let i = k; i <= n; i++) {
    result += dp[i];
  }

  return result;
};
```

0838 Push Dominoes

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 838. Push Dominoes
 * https://leetcode.com/problems/push-dominoes/
 * Difficulty: Medium
 *
 * There are n dominoes in a line, and we place each domino vertically upright. In the
beginning,
 * we simultaneously push some of the dominoes either to the left or to the right.
 *
 * After each second, each domino that is falling to the left pushes the adjacent domino on
the
 * left. Similarly, the dominoes falling to the right push their adjacent dominoes standing on
 * the right.
 *
 * When a vertical domino has dominoes falling on it from both sides, it stays still due to
the
 * balance of the forces.
 *
 * For the purposes of this question, we will consider that a falling domino expends no
additional
 * force to a falling or already fallen domino.
 *
 * You are given a string dominoes representing the initial state where:
 * - dominoes[i] = 'L', if the ith domino has been pushed to the left,
 * - dominoes[i] = 'R', if the ith domino has been pushed to the right, and
 * - dominoes[i] = '.', if the ith domino has not been pushed.
 *
 * Return a string representing the final state.
 */

/**
 * @param {string} dominoes
 * @return {string}
 */
var pushDominoes = function(dominoes) {
  const forces = new Array(dominoes.length).fill(0);

  let force = 0;
  for (let i = 0; i < dominoes.length; i++) {
    if (dominoes[i] === 'R') {
      force = dominoes.length;
    } else if (dominoes[i] === 'L') {
      force = 0;

  return forces.map(f => {
    if (f > 0) return 'R';
    if (f < 0) return 'L';
    return '.';
  }).join('');
};
```

0839 Similar String Groups

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 839. Similar String Groups
 * https://leetcode.com/problems/similar-string-groups/
 * Difficulty: Hard
 *
 * Two strings, X and Y, are considered similar if either they are identical or we can make
them
 * equivalent by swapping at most two letters (in distinct positions) within the string X.
 *
 * For example, "tars" and "rats" are similar (swapping at positions 0 and 2), and "rats" and
 * "arts" are similar, but "star" is not similar to "tars", "rats", or "arts".
 *
 * Together, these form two connected groups by similarity: {"tars", "rats", "arts"} and
{"star"}.
 * Notice that "tars" and "arts" are in the same group even though they are not similar.
Formally,
 * each group is such that a word is in the group if and only if it is similar to at least one
 * other word in the group.
 *
 * We are given a list strs of strings where every string in strs is an anagram of every other
 * string in strs. How many groups are there?
 */

0841 Keys And Rooms

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 841. Keys and Rooms
 * https://leetcode.com/problems/keys-and-rooms/
 * Difficulty: Medium
 *
 * There are n rooms labeled from 0 to n - 1 and all the rooms are locked except for room 0.
 * Your goal is to visit all the rooms. However, you cannot enter a locked room without
 * having its key.
 *
 * When you visit a room, you may find a set of distinct keys in it. Each key has a number
 * on it, denoting which room it unlocks, and you can take all of them with you to unlock
 * the other rooms.
 *
 * Given an array rooms where rooms[i] is the set of keys that you can obtain if you visited
 * room i, return true if you can visit all the rooms, or false otherwise.
 */

/**
 * @param {number[][]} rooms
 * @return {boolean}
 */

  const set = new Set([0]);
  for (const key of set) {
    rooms[key].forEach(value => set.add(value));
  }
  return set.size === rooms.length;
};
```

0842 Split Array Into Fibonacci Sequence

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 842. Split Array into Fibonacci Sequence
 * https://leetcode.com/problems/split-array-into-fibonacci-sequence/
 * Difficulty: Medium
 *
 * You are given a string of digits num, such as "123456579". We can split it into a
Fibonacci-like
 * sequence [123, 456, 579].
 *
 * Formally, a Fibonacci-like sequence is a list f of non-negative integers such that:
 * - 0 <= f[i] < 231, (that is, each integer fits in a 32-bit signed integer type),
 * - f.length >= 3, and
 * - f[i] + f[i + 1] == f[i + 2] for all 0 <= i < f.length - 2.
 *
 * Note that when splitting the string into pieces, each piece must not have extra leading
zeroes,
 * except if the piece is the number 0 itself.
 *
 * Return any Fibonacci-like sequence split from num, or return [] if it cannot be done.
 */

/**
 * @param {string} num
 * @return {number[]}
 */
var splitIntoFibonacci = function(num) {
  const result = [];
  const MAX_INT = 2 ** 31 - 1;
  backtrack(0);
  return result;

  function backtrack(index) {
    if (index === num.length && result.length >= 3) return true;
    for (let length = 1; length <= num.length - index; length++) {
```

```
      if (num[index] === '0' && length > 1) break;
      const current = parseInt(num.substring(index, index + length));
      if (current > MAX_INT) break;
      if (result.length >= 2) {
        const sum = result[result.length - 1] + result[result.length - 2];
        if (current > sum) break;
        if (current < sum) continue;
      }
      result.push(current);
      if (backtrack(index + length)) return true;
      result.pop();
    }
    return false;
  }
};
```

0843 Guess The Word

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 843. Guess the Word
 * https://leetcode.com/problems/guess-the-word/
 * Difficulty: Hard
 *
 * You are given an array of unique strings words where words[i] is six letters long. One word
 of
 * words was chosen as a secret word.
 *
 * You are also given the helper object Master. You may call Master.guess(word) where word is
a
 * six-letter-long string, and it must be from words. Master.guess(word) returns:
 * - -1 if word is not from words, or
 * - an integer representing the number of exact matches (value and position) of your guess to
 *   the secret word.
 *
 * There is a parameter allowedGuesses for each test case where allowedGuesses is the maximum
 * number of times you can call Master.guess(word).
 *
 * For each test case, you should call Master.guess with the secret word without exceeding the
 * maximum number of allowed guesses. You will get:
 * - "Either you took too many guesses, or you did not find the secret word." if you called
 *   Master.guess more than allowedGuesses times or if you did not call Master.guess with the
 *   secret word, or
 * - "You guessed the secret word correctly." if you called Master.guess with the secret word
 *   with the number of calls to Master.guess less than or equal to allowedGuesses.
 *
 * The test cases are generated such that you can guess the secret word with a reasonable
 * strategy (other than using the bruteforce method).
 */

/**
 * @param {string[]} words
 * @param {Master} master
 * @return {void}
 */
var findSecretWord = function(words, master) {
  for (let attempt = 0; attempt < 30; attempt++) {
    const randomWord = words[Math.floor(Math.random() * words.length)];

    if (matchCount === 6) return;

    words = words.filter(word =>
      matchCount === -1
        ? countMatches(word, randomWord) === 0
        : countMatches(word, randomWord) === matchCount
    );
  }
```

```
  function countMatches(word1, word2) {
    let matches = 0;
    for (let i = 0; i < word1.length; i++) {
      if (word1[i] === word2[i]) matches++;
    }
    return matches;
  }
};
```

0844 Backspace String Compare

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 844. Backspace String Compare
 * https://leetcode.com/problems/backspace-string-compare/
 * Difficulty: Easy
 *
 * Given two strings `s` and `t`, return true if they are equal when both
 * are typed into empty text editors. '#' means a backspace character.
 *
 * Note that after backspacing an empty text, the text will continue empty.
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {boolean}
 */
var backspaceCompare = function(s, t) {
  return handleBackspaces(s) === handleBackspaces(t);
};

function handleBackspaces(input) {
  return input.split('').reduce((result, char) => {
    if (char === '#') {
      result.pop();
    } else {
      result.push(char);
    }
    return result;
  }, []).join('');
}
```

0845 Longest Mountain In Array

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 845. Longest Mountain in Array
 * https://leetcode.com/problems/longest-mountain-in-array/
 * Difficulty: Medium
 *
 * You may recall that an array arr is a mountain array if and only if:
 * - arr.length >= 3
 * - There exists some index i (0-indexed) with 0 < i < arr.length - 1 such that:
 *   - arr[0] < arr[1] < ... < arr[i - 1] < arr[i]
 *   - arr[i] > arr[i + 1] > ... > arr[arr.length - 1]
 *
 * Given an integer array arr, return the length of the longest subarray, which is a
 * mountain. Return 0 if there is no mountain subarray.
 */

```

0855 Exam Room

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 855. Exam Room
 * https://leetcode.com/problems/exam-room/
 * Difficulty: Medium
 *
 * There is an exam room with n seats in a single row labeled from 0 to n - 1.
 *
 * When a student enters the room, they must sit in the seat that maximizes the distance to
the
 * closest person. If there are multiple such seats, they sit in the seat with the lowest
number.
 * If no one is in the room, then the student sits at seat number 0.
 *
 * Design a class that simulates the mentioned exam room.
 *
 * Implement the ExamRoom class:
 * - ExamRoom(int n) Initializes the object of the exam room with the number of the seats n.
```

```
 * - int seat() Returns the label of the seat at which the next student will set.
 * - void leave(int p) Indicates that the student sitting at seat p will leave the room. It is
 *   guaranteed that there will be a student sitting at seat p.
 */

/**
 * @param {number} n - Number of seats in the exam room
 */

      const value = stack.pop();
      stack[stack.length - 1] += Math.max(2 * value, 1);
    }
  }

  return stack[0];
};
```

0857 Minimum Cost To Hire K Workers

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 857. Minimum Cost to Hire K Workers
 * https://leetcode.com/problems/minimum-cost-to-hire-k-workers/
 * Difficulty: Hard
 *
 * There are n workers. You are given two integer arrays quality and wage where quality[i] is
the
 * quality of the ith worker and wage[i] is the minimum wage expectation for the ith worker.
 *
 * We want to hire exactly k workers to form a paid group. To hire a group of k workers, we
must
 * pay them according to the following rules:
 * 1. Every worker in the paid group must be paid at least their minimum wage expectation.
 * 2. In the group, each worker's pay must be directly proportional to their quality. This
means
 *    if a worker’s quality is double that of another worker in the group, then they must be
paid
 *    twice as much as the other worker.
 *
 * Given the integer k, return the least amount of money needed to form a paid group
satisfying
 * the above conditions. Answers within 10-5 of the actual answer will be accepted.
 */

/**
```

```
 * @param {number[]} quality
 * @param {number[]} wage
 * @param {number} k
 * @return {number}
 */
var mincostToHireWorkers = function(quality, wage, k) {
  const workers = quality.map((q, i) => ({ ratio: wage[i] / q, quality: q }))
    .sort((a, b) => a.ratio - b.ratio);

  let result = Infinity;
  let qualitySum = 0;
  const maxHeap = new MaxPriorityQueue();

  for (const worker of workers) {
    maxHeap.enqueue(worker.quality);
    qualitySum += worker.quality;

    if (maxHeap.size() > k) {
      qualitySum -= maxHeap.dequeue();
    }

    if (maxHeap.size() === k) {
      result = Math.min(result, qualitySum * worker.ratio);
    }
  }

  return result;
};
```

0858 Mirror Reflection

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 858. Mirror Reflection
 * https://leetcode.com/problems/mirror-reflection/
 * Difficulty: Medium
 *
 * There is a special square room with mirrors on each of the four walls. Except for the
southwest
 * corner, there are receptors on each of the remaining corners, numbered 0, 1, and 2.
 *
 * The square room has walls of length p and a laser ray from the southwest corner first meets
 the
 * east wall at a distance q from the 0th receptor.
 *
 * Given the two integers p and q, return the number of the receptor that the ray meets first.
 *
 * The test cases are guaranteed so that the ray will meet a receptor eventually.
 */

/**
 * @param {number} p
 * @param {number} q
 * @return {number}
 */
var mirrorReflection = function(p, q) {
  const gcd = findGCD(p, q);

0864 Shortest Path To Get All Keys

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 864. Shortest Path to Get All Keys
 * https://leetcode.com/problems/shortest-path-to-get-all-keys/
 * Difficulty: Hard
 *
 * You are given an m x n grid grid where:
 * - '.' is an empty cell.
 * - '#' is a wall.
 * - '@' is the starting point.
 * - Lowercase letters represent keys.
```

```
 * - Uppercase letters represent locks.
 *
 * You start at the starting point and one move consists of walking one space in one of the
 * four cardinal directions. You cannot walk outside the grid, or walk into a wall.
 *
 * If you walk over a key, you can pick it up and you cannot walk over a lock unless you have
 * its corresponding key.
 *
 * For some 1 <= k <= 6, there is exactly one lowercase and one uppercase letter of the first
 * k letters of the English alphabet in the grid. This means that there is exactly one key for
 * each lock, and one lock for each key; and also that the letters used to represent the keys
 * and locks were chosen in the same order as the English alphabet.
 *
 * Return the lowest number of moves to acquire all keys. If it is impossible, return -1.
 */

0871 Minimum Number Of Refueling Stops

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 871. Minimum Number of Refueling Stops
 * https://leetcode.com/problems/minimum-number-of-refueling-stops/
 * Difficulty: Hard
 *
 * A car travels from a starting position to a destination which is target miles east of the
 * starting position.
 *
 * There are gas stations along the way. The gas stations are represented as an array stations
 * where stations[i] = [positioni, fueli] indicates that the ith gas station is positioni
miles
 * east of the starting position and has fueli liters of gas.
 *
 * The car starts with an infinite tank of gas, which initially has startFuel liters of fuel
```

```
in
 * it. It uses one liter of gas per one mile that it drives. When the car reaches a gas
station,
 * it may stop and refuel, transferring all the gas from the station into the car.
 *
 * Return the minimum number of refueling stops the car must make in order to reach its
destination.
 * If it cannot reach the destination, return -1.
 *
 * Note that if the car reaches a gas station with 0 fuel left, the car can still refuel
there.
 * If the car reaches the destination with 0 fuel left, it is still considered to have
arrived.
 */

0874 Walking Robot Simulation

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 874. Walking Robot Simulation
 * https://leetcode.com/problems/walking-robot-simulation/
 * Difficulty: Medium
 *
 * A robot on an infinite XY-plane starts at point (0, 0) facing north. The robot receives an
array
 * of integers commands, which represents a sequence of moves that it needs to execute. There
are
 * only three possible types of instructions the robot can receive:
 * - -2: Turn left 90 degrees.
 * - -1: Turn right 90 degrees.
 * - 1 <= k <= 9: Move forward k units, one unit at a time.
 *
 * Some of the grid squares are obstacles. The ith obstacle is at grid point
 * obstacles[i] = (xi, yi). If the robot runs into an obstacle, it will stay in its current
location
 * (on the block adjacent to the obstacle) and move onto the next command.
 *
 * Return the maximum squared Euclidean distance that the robot reaches at any point in its
path
 * (i.e. if the distance is 5, return 25).
 *
 * Note:
 * - There can be an obstacle at (0, 0). If this happens, the robot will ignore the obstacle
until
 *   it has moved off the origin. However, it will be unable to return to (0, 0) due to the
 *   obstacle.
 * - North means +Y direction.
 * - East means +X direction.
 * - South means -Y direction.
 * - West means -X direction.
 */

/**
 * @param {number[]} commands
 * @param {number[][]} obstacles
 * @return {number}
 */

0882 Reachable Nodes In Subdivided Graph

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 882. Reachable Nodes In Subdivided Graph
 * https://leetcode.com/problems/reachable-nodes-in-subdivided-graph/
```

```
 * Difficulty: Hard
 *
 * You are given an undirected graph (the "original graph") with n nodes labeled from 0 to n -
 1.
 * You decide to subdivide each edge in the graph into a chain of nodes, with the number of
new
 * nodes varying between each edge.
 *
 * The graph is given as a 2D array of edges where edges[i] = [ui, vi, cnti] indicates that
there
 * is an edge between nodes ui and vi in the original graph, and cnti is the total number of
new
 * nodes that you will subdivide the edge into. Note that cnti == 0 means you will not
subdivide
 * the edge.
 *
 * To subdivide the edge [ui, vi], replace it with (cnti + 1) new edges and cnti new nodes.
The
 * new nodes are x1, x2, ..., xcnti, and the new edges are [ui, x1], [x1, x2], [x2, x3], ...,
 * [xcnti-1, xcnti], [xcnti, vi].
 *
 * In this new graph, you want to know how many nodes are reachable from the node 0, where a
node
 * is reachable if the distance is maxMoves or less.
 *
 * Given the original graph and maxMoves, return the number of nodes that are reachable from
node
 * 0 in the new graph.
 */

0885 Spiral Matrix Iii

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 885. Spiral Matrix III
 * https://leetcode.com/problems/spiral-matrix-iii/
 * Difficulty: Medium
 *
 * You start at the cell (rStart, cStart) of an rows x cols grid facing east. The northwest
corner
 * is at the first row and column in the grid, and the southeast corner is at the last row and
 * column.
 *
 * You will walk in a clockwise spiral shape to visit every position in this grid. Whenever
you
 * move outside the grid's boundary, we continue our walk outside the grid (but may return to
the
 * grid boundary later.). Eventually, we reach all rows * cols spaces of the grid.
 *
 * Return an array of coordinates representing the positions of the grid in the order you
visited
 * them.
 */

/**
 * @param {number} rows
 * @param {number} cols
 * @param {number} rStart
 * @param {number} cStart
 * @return {number[][]}
 */
var spiralMatrixIII = function(rows, cols, rStart, cStart) {
  const result = [];
  const total = rows * cols;
```

```
  let row = rStart;
  let col = cStart;
  let step = 1;
  let direction = 0;
  const directions = [[0, 1], [1, 0], [0, -1], [-1, 0]];

  result.push([row, col]);

  while (result.length < total) {
    for (let i = 0; i < 2; i++) {
      const [dr, dc] = directions[direction];
      for (let j = 0; j < step; j++) {
        row += dr;
        col += dc;
        if (row >= 0 && row < rows && col >= 0 && col < cols) {
          result.push([row, col]);
        }
      }
      direction = (direction + 1) % 4;
    }
    step++;
  }

  return result;
};
```

0886 Possible Bipartition

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 886. Possible Bipartition
 * https://leetcode.com/problems/possible-bipartition/
 * Difficulty: Medium
 *
 * We want to split a group of n people (labeled from 1 to n) into two groups of any size.
 * Each person may dislike some other people, and they should not go into the same group.
 *
 * Given the integer n and the array dislikes where dislikes[i] = [ai, bi] indicates that
 * the person labeled ai does not like the person labeled bi, return true if it is possible
 * to split everyone into two groups in this way.
 */

/**
 * @param {number} n
 * @param {number[][]} dislikes
 * @return {boolean}
 */
var possibleBipartition = function(n, dislikes) {
  const graph = Array.from({ length: n + 1 }, () => []);
  dislikes.forEach(([a, b]) => {
    graph[a].push(b);
    graph[b].push(a);
  });

  const colors = new Array(n + 1).fill(0);

  function colorGraph(person, color) {
    colors[person] = color;

  }

  return solve(k, n);
};
```

0888 Fair Candy Swap

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 888. Fair Candy Swap
 * https://leetcode.com/problems/fair-candy-swap/
 * Difficulty: Easy
 *
 * Alice and Bob have a different total number of candies. You are given two integer arrays
 * aliceSizes and bobSizes where aliceSizes[i] is the number of candies of the ith box of
 * candy that Alice has and bobSizes[j] is the number of candies of the jth box of candy
 * that Bob has.
 *
 * Since they are friends, they would like to exchange one candy box each so that after the
 * exchange, they both have the same total amount of candy. The total amount of candy a
 * person has is the sum of the number of candies in each box they have.
 *
 * Return an integer array answer where answer[0] is the number of candies in the box that
 * Alice must exchange, and answer[1] is the number of candies in the box that Bob must
 * exchange. If there are multiple answers, you may return any one of them. It is guaranteed
 * that at least one answer exists.
 */

/**
 * @param {number[]} aliceSizes
 * @param {number[]} bobSizes
 * @return {number[]}
 */
var fairCandySwap = function(aliceSizes, bobSizes) {
  const aliceTotal = aliceSizes.reduce((sum, size) => sum + size, 0);
  const bobTotal = bobSizes.reduce((sum, size) => sum + size, 0);
  const diff = (aliceTotal - bobTotal) / 2;
  const bobSet = new Set(bobSizes);

  for (const aliceBox of aliceSizes) {
    const targetBobBox = aliceBox - diff;
    if (bobSet.has(targetBobBox)) {
      return [aliceBox, targetBobBox];
    }
  }
};
```

0889 Construct Binary Tree From Preorder And Postorder Traversal

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 889. Construct Binary Tree from Preorder and Postorder Traversal
 * https://leetcode.com/problems/construct-binary-tree-from-preorder-and-postorder-traversal/
 * Difficulty: Medium
 *
 * Given two integer arrays, preorder and postorder where preorder is the preorder traversal
of a
 * binary tree of distinct values and postorder is the postorder traversal of the same tree,
 * reconstruct and return the binary tree.
 *
 * If there exist multiple answers, you can return any of them.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {number[]} preorder
 * @param {number[]} postorder
 * @return {TreeNode}
 */
var constructFromPrePost = function(preorder, postorder) {
```

```
  if (!preorder.length) return null;

  const root = new TreeNode(preorder[0]);
  if (preorder.length === 1) return root;

  const leftSize = postorder.indexOf(preorder[1]) + 1;
  root.left = constructFromPrePost(
    preorder.slice(1, leftSize + 1),
    postorder.slice(0, leftSize)
  );
  root.right = constructFromPrePost(
    preorder.slice(leftSize + 1),
    postorder.slice(leftSize, -1)
  );

  return root;
};
```

0890 Find And Replace Pattern

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 890. Find and Replace Pattern
 * https://leetcode.com/problems/find-and-replace-pattern/
 * Difficulty: Medium
 *
 * You have a list of words and a pattern, and you want to know which words in words matches
the pattern.
 *
 * A word matches the pattern if there exists a permutation of letters p so that after
replacing every
 * letter x in the pattern with p(x), we get the desired word.
 *
 * (Recall that a permutation of letters is a bijection from letters to letters: every letter
maps to
 * another letter, and no two letters map to the same letter.)
 *
 * Return a list of the words in words that match the given pattern.
 *
 * You may return the answer in any order.
 */

/**
 * @param {string[]} words
 * @param {string} pattern
 * @return {string[]}
 */
var findAndReplacePattern = function(words, pattern) {
  const map = (p, o = {}, count = 0) => p.split('').map(c => o[c] = o[c] ||
String(count++)).join('');
  return words.filter(word => map(word) === map(pattern));
};
```

0891 Sum Of Subsequence Widths

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 891. Sum of Subsequence Widths
 * https://leetcode.com/problems/sum-of-subsequence-widths/
 * Difficulty: Hard
 *
 * The width of a sequence is the difference between the maximum and minimum elements
 * in the sequence.
```

```
 *
 * Given an array of integers nums, return the sum of the widths of all the non-empty
 * subsequences of nums. Since the answer may be very large, return it modulo 109 + 7.
 *
 * A subsequence is a sequence that can be derived from an array by deleting some or
 * no elements without changing the order of the remaining elements. For example,
 * [3,6,2,7] is a subsequence of the array [0,3,1,6,2,2,7].
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var sumSubseqWidths = function(nums) {
  const MOD = 1e9 + 7;
  const n = nums.length;
  const powers = [1];

  nums.sort((a, b) => a - b);

    powers[i] = (powers[i - 1] * 2) % MOD;
  }

  let result = 0;
  for (let i = 0; i < n; i++) {
    const contribution = (nums[i] * (powers[i] - powers[n - 1 - i] + MOD)) % MOD;
    result = (result + contribution) % MOD;
  }

  return result;
};
```

0892 Surface Area Of 3D Shapes

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 892. Surface Area of 3D Shapes
 * https://leetcode.com/problems/surface-area-of-3d-shapes/
 * Difficulty: Easy
 *
 * You are given an n x n grid where you have placed some 1 x 1 x 1 cubes. Each value
 * v = grid[i][j] represents a tower of v cubes placed on top of cell (i, j).
 *
 * After placing these cubes, you have decided to glue any directly adjacent cubes to
 * each other, forming several irregular 3D shapes.
 *
 * Return the total surface area of the resulting shapes.
 *
 * Note: The bottom face of each shape counts toward its surface area.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var surfaceArea = function(grid) {
  let result = 0;

  for (let row = 0; row < grid.length; row++) {
    for (let col = 0; col < grid.length; col++) {
      if (grid[row][col]) {
        result += 2 + 4 * grid[row][col];

        result -= row > 0 ? Math.min(grid[row][col], grid[row - 1][col]) * 2 : 0;
        result -= col > 0 ? Math.min(grid[row][col], grid[row][col - 1]) * 2 : 0;
      }
    }
  }
```

```
  return result;
};
```

0893 Groups Of Special Equivalent Strings

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 893. Groups of Special-Equivalent Strings
 * https://leetcode.com/problems/groups-of-special-equivalent-strings/
 * Difficulty: Medium
 *
 * You are given an array of strings of the same length words.
 *
 * In one move, you can swap any two even indexed characters or any two odd indexed characters
 of
 * a string words[i].
 *
 * Two strings words[i] and words[j] are special-equivalent if after any number of moves,
 * words[i] == words[j].
 * - For example, words[i] = "zzxy" and words[j] = "xyzz" are special-equivalent because we
may
 *   make the moves "zzxy" -> "xzzy" -> "xyzz".
 *
 * A group of special-equivalent strings from words is a non-empty subset of words such that:
 * - Every pair of strings in the group are special equivalent, and
 * - The group is the largest size possible (i.e., there is not a string words[i] not in the
 *   group such that words[i] is special-equivalent to every string in the group).
 *
 * Return the number of groups of special-equivalent strings from words.
 */

/**
 * @param {string[]} words
 * @return {number}
 */
var numSpecialEquivGroups = function(words) {
  return new Set(words.map(normalizeWord)).size;

};
```

0898 Bitwise Ors Of Subarrays

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 898. Bitwise ORs of Subarrays
 * https://leetcode.com/problems/bitwise-ors-of-subarrays/
 * Difficulty: Medium
 *
 * Given an integer array arr, return the number of distinct bitwise ORs of all the non-empty
 * subarrays of arr.
 *
 * The bitwise OR of a subarray is the bitwise OR of each integer in the subarray. The bitwise
 * OR of a subarray of one integer is that integer.
 *
 * A subarray is a contiguous non-empty sequence of elements within an array.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
var subarrayBitwiseORs = function(arr) {
  const results = new Set();
  let previous = new Set();

  for (const num of arr) {
    const current = new Set([num]);
    for (const prev of previous) {
      current.add(prev | num);
    }
    previous = current;
    previous.forEach(val => results.add(val));
  }
```

```
  return results.size;
};
```

0899 Orderly Queue

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 899. Orderly Queue
 * https://leetcode.com/problems/orderly-queue/
 * Difficulty: Hard
 *
 * You are given a string s and an integer k. You can choose one of the first k letters of s
 * and append it at the end of the string.
 *
 * Return the lexicographically smallest string you could have after applying the mentioned
 * step any number of moves.
 */

/**
 * @param {string} s
 * @param {number} k
 * @return {string}
 */
var orderlyQueue = function(s, k) {
  if (k === 1) {
    let smallest = s;
    for (let i = 0; i < s.length; i++) {
      const rotated = s.slice(i) + s.slice(0, i);
      if (rotated < smallest) smallest = rotated;
    }
    return smallest;
  }
  return [...s].sort().join('');
};
```

0900 Rle Iterator

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 900. RLE Iterator
 * https://leetcode.com/problems/rle-iterator/
 * Difficulty: Medium
 *
 * We can use run-length encoding (i.e., RLE) to encode a sequence of integers. In a
run-length
 * encoded array of even length encoding (0-indexed), for all even i, encoding[i] tells us the
 * number of times that the non-negative integer value encoding[i + 1] is repeated in the
sequence.
 * - For example, the sequence arr = [8,8,8,5,5] can be encoded to be encoding = [3,8,2,5].
 *   encoding = [3,8,0,9,2,5] and encoding = [2,8,1,8,2,5] are also valid RLE of arr.
 *
 * Given a run-length encoded array, design an iterator that iterates through it.
 *
 * Implement the RLEIterator class:
 * - RLEIterator(int[] encoded) Initializes the object with the encoded array encoded.
 * - int next(int n) Exhausts the next n elements and returns the last element exhausted in
this
 *   way. If there is no element left to exhaust, return -1 instead.
 */

/**
 * @param {number[]} encoding
```

```
 */
var RLEIterator = function(encoding) {
  this.pairs = [];
  this.index = 0;
  this.count = 0;

  for (let i = 0; i < encoding.length; i += 2) {
    if (encoding[i] > 0) {
      this.pairs.push([encoding[i], encoding[i + 1]]);
    }
  }
};

/**
 * @param {number} n
 * @return {number}
 */
RLEIterator.prototype.next = function(n) {
  while (n > 0 && this.index < this.pairs.length) {
    const available = this.pairs[this.index][0] - this.count;

    if (n <= available) {
      this.count += n;
      return this.pairs[this.index][1];
    }

    n -= available;
    this.count = 0;
    this.index++;
  }

  return -1;
};
```

0901 Online Stock Span

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 901. Online Stock Span
 * https://leetcode.com/problems/online-stock-span/
 * Difficulty: Medium
 *
 * Design an algorithm that collects daily price quotes for some stock and returns the
 * span of that stock's price for the current day.
 *
 * The span of the stock's price in one day is the maximum number of consecutive days
 * (starting from that day and going backward) for which the stock price was less than
 * or equal to the price of that day.
 *
 * - For example, if the prices of the stock in the last four days is [7,2,1,2] and the
 *   price of the stock today is 2, then the span of today is 4 because starting from
 *   today, the price of the stock was less than or equal 2 for 4 consecutive days.
 *
 * - Also, if the prices of the stock in the last four days is [7,34,1,2] and the price
 *   of the stock today is 8, then the span of today is 3 because starting from today,
 *   the price of the stock was less than or equal 8 for 3 consecutive days.
 *
 * Implement the StockSpanner class:
 * - StockSpanner() Initializes the object of the class.
 * - int next(int price) Returns the span of the stock's price given that today's
 *   price is price.

  }

  return result;
};
```

0904 Fruit Into Baskets

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 904. Fruit Into Baskets
 * https://leetcode.com/problems/fruit-into-baskets/
 * Difficulty: Medium
```

```
 *
 * You are visiting a farm that has a single row of fruit trees arranged from left to right.
 * The trees are represented by an integer array fruits where fruits[i] is the type of fruit
 * the ith tree produces.
 *
 * You want to collect as much fruit as possible. However, the owner has some strict rules
 * that you must follow:
 * - You only have two baskets, and each basket can only hold a single type of fruit. There
 *   is no limit on the amount of fruit each basket can hold.
 * - Starting from any tree of your choice, you must pick exactly one fruit from every tree
 *   (including the start tree) while moving to the right. The picked fruits must fit in one
 *   of your baskets.
 * - Once you reach a tree with fruit that cannot fit in your baskets, you must stop.
 *
 * Given the integer array fruits, return the maximum number of fruits you can pick.
 */

/**
 * @param {number[]} fruits
 * @return {number}
 */
var totalFruit = function(fruits) {
  const map = new Map();
  let result = 0;
  let start = 0;

  for (let end = 0; end < fruits.length; end++) {

  }

  return result;
};
```

0908 Smallest Range I

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 908. Smallest Range I
 * https://leetcode.com/problems/smallest-range-i/
 * Difficulty: Easy
 *
 * You are given an integer array nums and an integer k.
 *
 * In one operation, you can choose any index i where 0 <= i < nums.length and change nums[i]
to
 * nums[i] + x where x is an integer from the range [-k, k]. You can apply this operation at
most
 * once for each index i.
 *
 * The score of nums is the difference between the maximum and minimum elements in nums.
 *
 * Return the minimum score of nums after applying the mentioned operation at most once for
each
 * index in it.
 */

/**
 * @param {number[]} nums
 * @param {number} k
 * @return {number}
 */
var smallestRangeI = function(nums, k) {
  return Math.max(Math.max(...nums) - Math.min(...nums) - 2 * k, 0);
};
```

0909 Snakes And Ladders

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the

loop invariant.

SOURCE CODE

```
/**
 * 909. Snakes and Ladders
 * https://leetcode.com/problems/snakes-and-ladders/
 * Difficulty: Medium
 *
 * You are given an n x n integer matrix board where the cells are labeled from 1 to n2 in a
 * Boustrophedon style starting from the bottom left of the board (i.e. board[n - 1][0]) and
 * alternating direction each row.
 *
 * You start on square 1 of the board. In each move, starting from square curr, do the
following:
 * - Choose a destination square next with a label in the range [curr + 1, min(curr + 6, n2)].
 *   - This choice simulates the result of a standard 6-sided die roll: i.e., there are always
 at
 *     most 6 destinations, regardless of the size of the board.
 * - If next has a snake or ladder, you must move to the destination of that snake or ladder.
 *   Otherwise, you move to next.
 * - The game ends when you reach the square n2.
 *
 * A board square on row r and column c has a snake or ladder if board[r][c] != -1. The
destination
 * of that snake or ladder is board[r][c]. Squares 1 and n2 are not the starting points of any
 * snake or ladder.
 *
 * Note that you only take a snake or ladder at most once per dice roll. If the destination to
 a
 * snake or ladder is the start of another snake or ladder, you do not follow the subsequent
snake
 * or ladder.
 *
 * - For example, suppose the board is [[-1,4],[-1,3]], and on the first move, your
destination
 *   square is 2. You follow the ladder to square 3, but do not follow the subsequent ladder
to 4.
 *
 * Return the least number of dice rolls required to reach the square n2. If it is not
possible to
 * reach the square, return -1.
 */

/**
 * @param {number[][]} board
 * @return {number}
 */

    }
  }

  return nums;
};
```

0913 Cat And Mouse

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 913. Cat and Mouse
 * https://leetcode.com/problems/cat-and-mouse/
 * Difficulty: Hard
 *
 * A game on an undirected graph is played by two players, Mouse and Cat, who alternate turns.
 *
 * The graph is given as follows: graph[a] is a list of all nodes b such that ab is an edge of
 * the graph.
 *
 * The mouse starts at node 1 and goes first, the cat starts at node 2 and goes second, and
 * there is a hole at node 0.
 *
 * During each player's turn, they must travel along one edge of the graph that meets where
they
 * are. For example, if the Mouse is at node 1, it must travel to any node in graph[1].
 *
 * Additionally, it is not allowed for the Cat to travel to the Hole (node 0).
 *
 * Then, the game can end in three ways:
 * - If ever the Cat occupies the same node as the Mouse, the Cat wins.
 * - If ever the Mouse reaches the Hole, the Mouse wins.
 * - If ever a position is repeated (i.e., the players are in the same position as a previous
 *   turn, and it is the same player's turn to move), the game is a draw.
 *
 * Given a graph, and assuming both players play optimally, return
 * - 1 if the mouse wins the game,
 * - 2 if the cat wins the game, or
 * - 0 if the game is a draw.
 */

      map.set(char, (map.get(char) || 0) > count(b, char) ? map.get(char) : count(b, char));
    });
    return map;
  }, new Map()));
  return words1.filter(a => subset.every(match => count(a, match[0]) >= match[1]));
};
```

0917 Reverse Only Letters

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 917. Reverse Only Letters
 * https://leetcode.com/problems/reverse-only-letters/
 * Difficulty: Easy
 *
 * Given a string s, reverse the string according to the following rules:
 * - All the characters that are not English letters remain in the same position.
 * - All the English letters (lowercase or uppercase) should be reversed.
 *
 * Return s after reversing it.
 */

/**
 * @param {string} s
 * @return {string}
 */
var reverseOnlyLetters = function(s) {
  const chars = s.split('');
  let left = 0;
  let right = s.length - 1;

  while (left < right) {
    while (left < right && !/[a-zA-Z]/.test(chars[left])) {
      left++;
```

```
    }
    while (left < right && !/[a-zA-Z]/.test(chars[right])) {
      right--;
    }
    [chars[left], chars[right]] = [chars[right], chars[left]];
    left++;
    right--;
  }

  return chars.join('');
};
```

0918 Maximum Sum Circular Subarray

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 918. Maximum Sum Circular Subarray
 * https://leetcode.com/problems/maximum-sum-circular-subarray/
 * Difficulty: Medium
 *
 * Given a circular integer array nums of length n, return the maximum possible sum of
 * a non-empty subarray of nums.
 *
 * A circular array means the end of the array connects to the beginning of the array.
 * Formally, the next element of nums[i] is nums[(i + 1) % n] and the previous element
 * of nums[i] is nums[(i - 1 + n) % n].
 *
 * A subarray may only include each element of the fixed buffer nums at most once.
 * Formally, for a subarray nums[i], nums[i + 1], ..., nums[j], there does not exist
 * i <= k1, k2 <= j with k1 % n == k2 % n.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var maxSubarraySumCircular = function(nums) {
  let [min, max, sum] = [nums[0], nums[0], nums[0]];

```

0924 Minimize Malware Spread

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 924. Minimize Malware Spread
 * https://leetcode.com/problems/minimize-malware-spread/
 * Difficulty: Hard
 *
 * You are given a network of n nodes represented as an n x n adjacency matrix graph, where
the ith
 * node is directly connected to the jth node if graph[i][j] == 1.
 *
 * Some nodes initial are initially infected by malware. Whenever two nodes are directly
connected,
 * and at least one of those two nodes is infected by malware, both nodes will be infected b
 * malware. This spread of malware will continue until no more nodes can be infected in this
manner.
 *
 * Suppose M(initial) is the final number of nodes infected with malware in the entire network
 after
 * the spread of malware stops. We will remove exactly one node from initial.
 *
 * Return the node that, if removed, would minimize M(initial). If multiple nodes could be
removed
 * to minimize M(initial), return such a node with the smallest index.
 *
 * Note that if a node was removed from the initial list of infected nodes, it might still be
 * infected later due to the malware spread.
```

```
 */

0925 Long Pressed Name

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 925. Long Pressed Name
 * https://leetcode.com/problems/long-pressed-name/
 * Difficulty: Easy
 *
 * Your friend is typing his name into a keyboard. Sometimes, when typing a character c,
```

```
 * the key might get long pressed, and the character will be typed 1 or more times.
 *
 * You examine the typed characters of the keyboard.  Return True if it is possible that
 * it was your friends name, with some characters (possibly none) being long pressed.
 */

/**
 * @param {string} name
 * @param {string} typed
 * @return {boolean}
 */
var isLongPressedName = function(name, typed) {
  let i = 0;
  return typed.split('').filter(l => name[i] === l ? ++i : false).length === name.length;
};
```

0926 Flip String To Monotone Increasing

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 926. Flip String to Monotone Increasing
 * https://leetcode.com/problems/flip-string-to-monotone-increasing/
 * Difficulty: Medium
 *
 * A binary string is monotone increasing if it consists of some number of 0's
 * (possibly none), followed by some number of 1's (also possibly none).
 *
 * You are given a binary string s. You can flip s[i] changing it from 0 to 1
 * or from 1 to 0.
 *
 * Return the minimum number of flips to make s monotone increasing.
 */

/**
 * @param {string} s
 * @return {number}
 */
var minFlipsMonoIncr = function(s) {
  let result = 0;
  let count = 0;

  for (const str of s) {
    if (str == '1') {

```

0927 Three Equal Parts

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 927. Three Equal Parts
 * https://leetcode.com/problems/three-equal-parts/
 * Difficulty: Hard
 *
 * You are given an array arr which consists of only zeros and ones, divide the array into
three
```

```
 * non-empty parts such that all of these parts represent the same binary value.
 *
 * If it is possible, return any [i, j] with i + 1 < j, such that:
 * - arr[0], arr[1], ..., arr[i] is the first part,
 * - arr[i + 1], arr[i + 2], ..., arr[j - 1] is the second part, and
 * - arr[j], arr[j + 1], ..., arr[arr.length - 1] is the third part.
 * - All three parts have equal binary values.
 *
 * If it is not possible, return [-1, -1].
 *
 * Note that the entire part is used when considering what binary value it represents. For
example,
 * [1,1,0] represents 6 in decimal, not 3. Also, leading zeros are allowed, so [0,1,1] and
[1,1]
 * represent the same value.
 */

```

0929 Unique Email Addresses

EASY

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 929. Unique Email Addresses
 * https://leetcode.com/problems/unique-email-addresses/
 * Difficulty: Easy
 *
 * Every email consists of a local name and a domain name, separated by the @ sign.
 *
 * For example, in alice@leetcode.com, alice is the local name, and leetcode.com is the domain
 name.
 *
 * Besides lowercase letters, these emails may contain '.'s or '+'s.
 *
 * If you add periods ('.') between some characters in the local name part of an email
address, mail
 * sent there will be forwarded to the same address without dots in the local name.
 * For example, "alice.z@leetcode.com" and "alicez@leetcode.com" forward to the same email
address.
 * (Note that this rule does not apply for domain names.)
 *
 * If you add a plus ('+') in the local name, everything after the first plus sign will be
ignored.
 * This allows certain emails to be filtered, for example m.y+name@email.com will be forwarded
 to
 * my@email.com. (Again, this rule does not apply for domain names.)
 *
 * It is possible to use both of these rules at the same time.
 *
 * Given a list of emails, we send one email to each address in the list.
 * How many different addresses actually receive mails?
 */

/**
 * @param {string[]} emails
 * @return {number}
 */
var numUniqueEmails = function(emails) {
  return new Set(emails.map(e => e.replace(/\.(?=[\w\.+]+@)|\+[\w.+]+(?=@)/g, ''))).size;
};
```

0930 Binary Subarrays With Sum

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```

  }

  return result;
};
```

0931 Minimum Falling Path Sum

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 931. Minimum Falling Path Sum
 * https://leetcode.com/problems/minimum-falling-path-sum/
 * Difficulty: Medium
 *
 * Given an n x n array of integers matrix, return the minimum sum of any falling path
 * through matrix.
 *
 * A falling path starts at any element in the first row and chooses the element in the
 * next row that is either directly below or diagonally left/right. Specifically, the
 * next element from position (row, col) will be (row + 1, col - 1), (row + 1, col),
 * or (row + 1, col + 1).
 */

/**
 * @param {number[][]} matrix
 * @return {number}
 */
var minFallingPathSum = function(matrix) {
  let previousRow = [...matrix[0]];

  for (let row = 1; row < matrix.length; row++) {
    const currentRow = new Array(matrix.length);
    for (let col = 0; col < matrix.length; col++) {
      const leftDiagonal = col > 0 ? previousRow[col - 1] : Infinity;
      const directlyAbove = previousRow[col];
      const rightDiagonal = col < matrix.length - 1 ? previousRow[col + 1] : Infinity;
```

```
      currentRow[col] = matrix[row][col] + Math.min(leftDiagonal, directlyAbove,
rightDiagonal);
    }
    previousRow = currentRow;
  }

  return Math.min(...previousRow);
};
```

0932 Beautiful Array

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 932. Beautiful Array
 * https://leetcode.com/problems/beautiful-array/
 * Difficulty: Medium
 *
 * An array nums of length n is beautiful if:
 * - nums is a permutation of the integers in the range [1, n].
 * - For every 0 <= i < j < n, there is no index k with i < k < j where
 * 2 * nums[k] == nums[i] + nums[j].
 *
 * Given the integer n, return any beautiful array nums of length n.
 * There will be at least one valid answer for the given n.
 */

/**
 * @param {number} n
 * @return {number[]}
 */
var beautifulArray = function(n) {
  const memo = new Map();
  return helper(n);

  function helper(size) {
    if (memo.has(size)) return memo.get(size);
    if (size === 1) return [1];

    const odds = helper(Math.ceil(size / 2));
    const evens = helper(Math.floor(size / 2));
    const result = [
      ...odds.map(x => x * 2 - 1),
      ...evens.map(x => x * 2)
    ];

    memo.set(size, result);
    return result;
  }
};
```

0933 Number Of Recent Calls

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 933. Number of Recent Calls
 * https://leetcode.com/problems/number-of-recent-calls/
 * Difficulty: Easy
 *
 * You have a RecentCounter class which counts the number of recent requests within
 * a certain time frame.
 *
 * Implement the RecentCounter class:
 * - RecentCounter() Initializes the counter with zero recent requests.
```

```
 * - int ping(int t) Adds a new request at time t, where t represents some time in
 *   milliseconds, and returns the number of requests that has happened in the past
 *   3000 milliseconds (including the new request). Specifically, return the number
 *   of requests that have happened in the inclusive range [t - 3000, t].
 *
 * It is guaranteed that every call to ping uses a strictly larger value of t than
 * the previous call.
 */

var RecentCounter = function() {
  this.queue = [];
};

/**
 * @param {number} t
 * @return {number}
 */
RecentCounter.prototype.ping = function(t) {
  this.queue.push(t);
  while (this.queue[0] < t - 3000) {
    this.queue.shift();
  }
  return this.queue.length;
};
```

0934 Shortest Bridge

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 934. Shortest Bridge
 * https://leetcode.com/problems/shortest-bridge/
 * Difficulty: Medium
 *
 * You are given an n x n binary matrix grid where 1 represents land and 0 represents water.
 *
 * An island is a 4-directionally connected group of 1's not connected to any other 1's.
 * There are exactly two islands in grid.
 *
 * You may change 0's to 1's to connect the two islands to form one island.
 *
 * Return the smallest number of 0's you must flip to connect the two islands.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var shortestBridge = function(grid) {
  const n = grid.length;
  const queue = [];
  const directions = [[0, 1], [1, 0], [0, -1], [-1, 0]];

  outer: for (let i = 0; i < n; i++) {
    for (let j = 0; j < n; j++) {
      if (grid[i][j] === 1) {
        findFirstIsland(i, j);
        break outer;
      }
    }
  }

  let distance = 0;
  while (queue.length) {

      findFirstIsland(row + dx, col + dy);
    }
  }
};
```

0935 Knight Dialer

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 935. Knight Dialer
 * https://leetcode.com/problems/knight-dialer/
 * Difficulty: Medium
 *
 * The chess knight has a unique movement, it may move two squares vertically and one square
 * horizontally, or two squares horizontally and one square vertically (with both forming
 * the shape of an L). The possible movements of chess knight are shown in this diagram:
 *
 * A chess knight can move as indicated in the chess diagram below.
 *
 * We have a chess knight and a phone pad as shown below, the knight can only stand on a
 * numeric cell (i.e. blue cell).
 *
 * Given an integer n, return how many distinct phone numbers of length n we can dial.
 *
 * You are allowed to place the knight on any numeric cell initially and then you should
 * perform n - 1 jumps to dial a number of length n. All jumps should be valid knight jumps.
 *
 * As the answer may be very large, return the answer modulo 109 + 7.
 */

/**
 * @param {number} n
 * @return {number}
 */
var knightDialer = function(n) {
  const MOD = 1e9 + 7;
  const moves = [
    [4, 6], [6, 8], [7, 9], [4, 8],
    [0, 3, 9], [], [0, 1, 7], [2, 6],
    [1, 3], [2, 4]
  ];
  let prevCounts = new Array(10).fill(1);

        currCounts[nextDigit] = (currCounts[nextDigit] + prevCounts[digit]) % MOD;
      }
    }
    prevCounts = currCounts;
```

```
  }

  return prevCounts.reduce((sum, count) => (sum + count) % MOD, 0);
};
```

0936 Stamping The Sequence

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 936. Stamping The Sequence
 * https://leetcode.com/problems/stamping-the-sequence/
 * Difficulty: Hard
 *
 * You are given two strings stamp and target. Initially, there is a string s of length
 * target.length with all s[i] == '?'.
 *
 * In one turn, you can place stamp over s and replace every letter in the s with the
 * corresponding letter from stamp.
 *
 * For example, if stamp = "abc" and target = "abcba", then s is "?????" initially.
 * In one turn you can:
 * - place stamp at index 0 of s to obtain "abc??",
 * - place stamp at index 1 of s to obtain "?abc?", or
 * - place stamp at index 2 of s to obtain "??abc".
 *
 * Note that stamp must be fully contained in the boundaries of s in order to stamp
 * (i.e., you cannot place stamp at index 3 of s).
 *
 * We want to convert s to target using at most 10 * target.length turns.
 *
 * Return an array of the index of the left-most letter being stamped at each turn. If we
 * cannot obtain target from s within 10 * target.length turns, return an empty array.
 */

/**
 * @param {string} stamp
 * @param {string} target
 * @return {number[]}
 */
var movesToStamp = function(stamp, target) {
  const stampLength = stamp.length;
  const targetLength = target.length;

    if (hasUnstamped) {
      for (let i = 0; i < stampLength; i++) {
        if (targetArray[position + i] !== '?') {
          targetArray[position + i] = '?';
          totalReplaced++;
        }
      }
      canStamp = true;
    }

    return canStamp;
  }
```

```
  const maxMoves = 10 * targetLength;
  while (moves.length <= maxMoves) {
    let madeChange = false;
    for (let i = 0; i <= targetLength - stampLength; i++) {
      if (tryStampAt(i)) {
        moves.push(i);
        madeChange = true;
        break;
      }
    }
    if (!madeChange) break;
    if (totalReplaced === targetLength) return moves.reverse();
  }

  return [];
};
```

0937 Reorder Data In Log Files

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 937. Reorder Data in Log Files
 * https://leetcode.com/problems/reorder-data-in-log-files/
 * Difficulty: Medium
 *
 * You are given an array of logs. Each log is a space-delimited string of words,
 * where the first word is the identifier.
 *
 * There are two types of logs:
 * - Letter-logs: All words (except the identifier) consist of lowercase English
 *   letters.
 * - Digit-logs: All words (except the identifier) consist of digits.
 *
 * Reorder these logs so that:
 * 1. The letter-logs come before all digit-logs.
 * 2. The letter-logs are sorted lexicographically by their contents. If their
 *   contents are the same, then sort them lexicographically by their identifiers.
 * 3. The digit-logs maintain their relative ordering.
 *
 * Return the final order of the logs.
 */

/**
 * @param {string[]} logs
 * @return {string[]}
 */
var reorderLogFiles = function(logs) {
  const split = logs.map(l => l.split(' '));
  const sortedA = split.filter(l => isNaN(parseInt(l[1], 10))).sort((a, b) => {
    return a[1] !== b[1]
      ? a[1].localeCompare(b[1]) : a[2] !== b[2]
        ? a[2].localeCompare(b[2]) : a.length === b.length
          ? a[0].localeCompare(b[0]) : a.length - b.length;
  }).map(l => l.join(' '));
  const sortedB = split.filter(l => !isNaN(parseInt(l[1], 10)))
    .sort((a, b) => b - a)
    .map(l => l.join(' '));

  return [...sortedA, ...sortedB];
};
```

0938 Range Sum Of Bst

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 938. Range Sum of BST
 * https://leetcode.com/problems/range-sum-of-bst/
 * Difficulty: Easy
 *
 * Given the root node of a binary search tree and two integers low and high, return the sum
 * of values of all nodes with a value in the inclusive range [low, high].
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number} low
 * @param {number} high
 * @return {number}
 */

```

0944 Delete Columns To Make Sorted

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 944. Delete Columns to Make Sorted
 * https://leetcode.com/problems/delete-columns-to-make-sorted/
 * Difficulty: Easy
 *
 * You are given an array of n strings strs, all of the same length.
 *
 * The strings can be arranged such that there is one on each line, making a grid.
 *
 * For example, strs = ["abc", "bce", "cae"] can be arranged as follows:
 * - abc
 * - bce
 * - cae
 *
 * You want to delete the columns that are not sorted lexicographically. In the above
 * example (0-indexed), columns 0 ('a', 'b', 'c') and 2 ('c', 'e', 'e') are sorted,
 * while column 1 ('b', 'c', 'a') is not, so you would delete column 1.
 *
 * Return the number of columns that you will delete.
 */

/**
 * @param {string[]} strs
 * @return {number}
 */
var minDeletionSize = function(strs) {
  let result = 0;

  for (let col = 0; col < strs[0].length; col++) {
    for (let row = 1; row < strs.length; row++) {
      if (strs[row][col] < strs[row - 1][col]) {
        result++;
        break;
      }
    }
  }

  return result;
};
```

0945 Minimum Increment To Make Array Unique

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 945. Minimum Increment to Make Array Unique
 * https://leetcode.com/problems/minimum-increment-to-make-array-unique/
 * Difficulty: Medium
 *
 * You are given an integer array nums. In one move, you can pick an index i where
 * 0 <= i < nums.length and increment nums[i] by 1.
 *
 * Return the minimum number of moves to make every value in nums unique.
 *
 * The test cases are generated so that the answer fits in a 32-bit integer.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
```

```
var minIncrementForUnique = function(nums) {
  nums.sort((a, b) => a - b);
  let result = 0;

  for (let i = 1, previous = nums[0]; i < nums.length; i++) {
    if (nums[i] <= previous) {
      previous++;
      result += previous - nums[i];
    } else {
      previous = nums[i];
    }
  }

  return result;
};
```

0946 Validate Stack Sequences

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 946. Validate Stack Sequences
 * https://leetcode.com/problems/validate-stack-sequences/
 * Difficulty: Medium
 *
 * Given two integer arrays pushed and popped each with distinct values, return true if this
could
 * have been the result of a sequence of push and pop operations on an initially empty stack,
or
 * false otherwise.
 */

/**

0947 Most Stones Removed With Same Row Or Column

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 947. Most Stones Removed with Same Row or Column
 * https://leetcode.com/problems/most-stones-removed-with-same-row-or-column/
 * Difficulty: Medium
 *
 * On a 2D plane, we place n stones at some integer coordinate points. Each coordinate point
may
 * have at most one stone.
```

```
 *
 * A stone can be removed if it shares either the same row or the same column as another stone
 * that has not been removed.
 *
 * Given an array stones of length n where stones[i] = [xi, yi] represents the location of the
 * ith stone, return the largest possible number of stones that can be removed.
 */

/**
 * @param {number[][]} stones
 * @return {number}
 */
var removeStones = function(stones) {
  const parent = new Map();
  const find = (stoneIndex) => {
    if (!parent.has(stoneIndex)) {
      parent.set(stoneIndex, stoneIndex);
    }
    if (parent.get(stoneIndex) !== stoneIndex) {
      parent.set(stoneIndex, find(parent.get(stoneIndex)));
    }
    return parent.get(stoneIndex);
  };

  const union = (stone1, stone2) => {
    parent.set(find(stone1), find(stone2));
  };

  const stoneMap = new Map();
  for (let i = 0; i < stones.length; i++) {
    const [row, col] = stones[i];
    const rowKey = `r${row}`;
    const colKey = `c${col}`;

    if (stoneMap.has(rowKey)) {
      union(i, stoneMap.get(rowKey));

```

0948 Bag Of Tokens

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 948. Bag of Tokens
 * https://leetcode.com/problems/bag-of-tokens/
 * Difficulty: Medium
 *
 * You start with an initial power of power, an initial score of 0, and a bag of tokens given
as
 * an integer array tokens, where each tokens[i] denotes the value of tokeni.
 *
 * Your goal is to maximize the total score by strategically playing these tokens. In one
move,
```

```
 * you can play an unplayed token in one of the two ways (but not both for the same token):
 * - Face-up: If your current power is at least tokens[i], you may play tokeni, losing
tokens[i]
 *   power and gaining 1 score.
 * - Face-down: If your current score is at least 1, you may play tokeni, gaining tokens[i]
power
 *   and losing 1 score.
 *
 * Return the maximum possible score you can achieve after playing any number of tokens.
 */

/**
 * @param {number[]} tokens
 * @param {number} power
 * @return {number}
 */
var bagOfTokensScore = function(tokens, power) {
  let score = 0;
  let result = 0;
  let left = 0;
  let right = tokens.length - 1;

  tokens.sort((a, b) => a - b);

  while (left <= right && (power >= tokens[left] || score > 0)) {
    while (left <= right && power >= tokens[left]) {
      power -= tokens[left];
      score++;
      left++;
    }
    result = Math.max(result, score);

    if (left <= right && score > 0) {

        used[i] = false;
      }
    }
  }
};
```

0950 Reveal Cards In Increasing Order

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 950. Reveal Cards In Increasing Order
 * https://leetcode.com/problems/reveal-cards-in-increasing-order/
 * Difficulty: Medium
 *
 * You are given an integer array deck. There is a deck of cards where every card has a
 * unique integer. The integer on the ith card is deck[i].
 *
 * You can order the deck in any order you want. Initially, all the cards start face down
 * (unrevealed) in one deck.
 *
 * You will do the following steps repeatedly until all cards are revealed:
 * 1. Take the top card of the deck, reveal it, and take it out of the deck.
 * 2. If there are still cards in the deck then put the next top card of the deck at the
 *    bottom of the deck.
 * 3. If there are still unrevealed cards, go back to step 1. Otherwise, stop.
 *
 * Return an ordering of the deck that would reveal the cards in increasing order.
 *
 * Note that the first entry in the answer is considered to be the top of the deck.
 */

0964 Least Operators To Express Number

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 964. Least Operators to Express Number
 * https://leetcode.com/problems/least-operators-to-express-number/
 * Difficulty: Hard
 *
 * Given a single positive integer x, we will write an expression of the form
 * x (op1) x (op2) x (op3) x ... where each operator op1, op2, etc. is either addition,
 * subtraction, multiplication, or division (+, -, *, or /). For example, with x = 3,
 * we might write 3 * 3 / 3 + 3 - 3 which is a value of 3.
 *
 * When writing such an expression, we adhere to the following conventions:
 * - The division operator (/) returns rational numbers.
 * - There are no parentheses placed anywhere.
 * - We use the usual order of operations: multiplication and division happen before
 *   addition and subtraction.
 * - It is not allowed to use the unary negation operator (-). For example, "x - x" is
 *   a valid expression as it only uses subtraction, but "-x + x" is not because it uses
 *   negation.
 *
 * We would like to write an expression with the least number of operators such that the
 * expression equals the given target. Return the least number of operators used.
 */

/**
 * @param {number} x
 * @param {number} target
 * @return {number}
 */
var leastOpsExpressTarget = function(x, target) {
  let costP = 0;
  let costN = 0;
  let power = 0;
  let minP;
  let minN;

  while (target > 0) {
    const digit = target % x;
    target = Math.floor(target / x);

    if (power > 0) {
      const nextPositive = Math.min(digit * power + costP, (digit + 1) * power + costN);
      const nextNegative = Math.min((x - digit) * power + costP, (x - digit - 1) * power +
costN);
      costP = nextPositive;
```

```
      costN = nextNegative;
    } else {
      costP = digit * 2;
      costN = (x - digit) * 2;
    }

    minP = costP;
    minN = costN;
    power++;
  }

  return Math.min(minP, power + minN) - 1;
};
```

0965 Univalued Binary Tree

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 965. Univalued Binary Tree
 * https://leetcode.com/problems/univalued-binary-tree/
 * Difficulty: Easy
 *
 * A binary tree is uni-valued if every node in the tree has the same value.
 *
 * Given the root of a binary tree, return true if the given tree is uni-valued, or false
otherwise.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @return {boolean}
 */
var isUnivalTree = function(root) {
  const traverse = n => !n ? true : n.val === root.val && isUnivalTree(n);
  return traverse(root.left) && traverse(root.right);
};
```

0966 Vowel Spellchecker

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 966. Vowel Spellchecker
 * https://leetcode.com/problems/vowel-spellchecker/
 * Difficulty: Medium
 *
 * Given a wordlist, we want to implement a spellchecker that converts a query word into a
correct word.
 * For a given query word, the spell checker handles two categories of spelling mistakes:
 *
 * - Capitalization: If the query matches a word in the wordlist (case-insensitive), then the
query word
 *   is returned with the same case as the case in the wordlist.
 *   Example: wordlist = ["yellow"], query = "YellOw": correct = "yellow"
 *   Example: wordlist = ["Yellow"], query = "yellow": correct = "Yellow"
 *   Example: wordlist = ["yellow"], query = "yellow": correct = "yellow"
```

```
 * - Vowel Errors: If after replacing the vowels ('a', 'e', 'i', 'o', 'u') of the query word
with any vowel
 *   individually, it matches a word in the wordlist (case-insensitive), then the query word
is returned
 *   with the same case as the match in the wordlist.
 *   Example: wordlist = ["YellOw"], query = "yollow": correct = "YellOw"
 *   Example: wordlist = ["YellOw"], query = "yeellow": correct = "" (no match)
 *   Example: wordlist = ["YellOw"], query = "yllw": correct = "" (no match)
 *
 * In addition, the spell checker operates under the following precedence rules:
 * - When the query exactly matches a word in the wordlist (case-sensitive), you should return
 the same word back.
 * - When the query matches a word up to capitlization, you should return the first such match
 in the wordlist.
 * - When the query matches a word up to vowel errors, you should return the first such match
in the wordlist.
 * - If the query has no matches in the wordlist, you should return the empty string.
 *
 * Given some queries, return a list of words answer, where answer[i] is the correct word for
query = queries[i].
 */

/**
 * @param {string[]} words
 * @param {string[]} queries
 * @return {string[]}
 */
var spellchecker = function(words, queries) {
  const set = new Set(words);
  const map = new Map();
  const format = s => s.toLowerCase().replace(/[aeiou]/g, '_');

  }
};
```

0969 Pancake Sorting

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 969. Pancake Sorting
 * https://leetcode.com/problems/pancake-sorting/
 * Difficulty: Medium
 *
 * Given an array of integers arr, sort the array by performing a series of pancake flips.
 *
 * In one pancake flip we do the following steps:
 * - Choose an integer k where 1 <= k <= arr.length.
 * - Reverse the sub-array arr[0...k-1] (0-indexed).
 *
 * For example, if arr = [3,2,1,4] and we performed a pancake flip choosing k = 3, we reverse
 * the sub-array [3,2,1], so arr = [1,2,3,4] after the pancake flip at k = 3.
 *
 * Return an array of the k-values corresponding to a sequence of pancake flips that sort arr.
 * Any valid answer that sorts the array within 10 * arr.length flips will be judged as
correct.
 */

/**
 * @param {number[]} arr
 * @return {number[]}
 */
var pancakeSort = function(arr) {
  const result = [];

    }

    if (x === 1) { break };
  }

  return Array.from(result);
};
```

0971 Flip Binary Tree To Match Preorder Traversal

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 971. Flip Binary Tree To Match Preorder Traversal
 * https://leetcode.com/problems/flip-binary-tree-to-match-preorder-traversal/
 * Difficulty: Medium
 *
 * You are given the root of a binary tree with n nodes, where each node is uniquely assigned
a
 * value from 1 to n. You are also given a sequence of n values voyage, which is the desired
 * pre-order traversal of the binary tree.
 *
 * Any node in the binary tree can be flipped by swapping its left and right subtrees. For
 * example, flipping node 1 will have the following effect.
 *
 * Flip the smallest number of nodes so that the pre-order traversal of the tree matches
voyage.
 *
 * Return a list of the values of all flipped nodes. You may return the answer in any order.
 * If it is impossible to flip the nodes in the tree to make the pre-order traversal match
 * voyage, return the list [-1].
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number[]} voyage
```

```
 * @return {number[]}
 */

    flips.push(node.val);
    [node.left, node.right] = [node.right, node.left];
    return traverse(node.left) && traverse(node.right);
  }
};
```

0972 Equal Rational Numbers

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 972. Equal Rational Numbers
 * https://leetcode.com/problems/equal-rational-numbers/
 * Difficulty: Hard
 *
 * Given two strings s and t, each of which represents a non-negative rational number, return
true
 * if and only if they represent the same number. The strings may use parentheses to denote
the
 * repeating part of the rational number.
 *
 * A rational number can be represented using up to three parts: <IntegerPart>,
<NonRepeatingPart>,
 * and a <RepeatingPart>. The number will be represented in one of the following three ways:
 * - <IntegerPart>
 *   - For example, 12, 0, and 123.
 * - <IntegerPart><.><NonRepeatingPart>
 *   - For example, 0.5, 1., 2.12, and 123.0001.
 * - <IntegerPart><.><NonRepeatingPart><(><RepeatingPart><)>
 *   - For example, 0.1(6), 1.(9), 123.00(1212).
 *
 * The repeating portion of a decimal expansion is conventionally denoted within a pair of
round
 * brackets. For example:
 * - 1/6 = 0.16666666... = 0.1(6) = 0.1666(6) = 0.166(66).
 */

/**
 * @param {string} s
 * @param {string} t
 * @return {boolean}
 */

    const remainder = ((sum % k) + k) % k;
    result += remainderCount.get(remainder) || 0;
    remainderCount.set(remainder, (remainderCount.get(remainder) || 0) + 1);
  }

  return result;
};
```

0975 Odd Even Jump

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 975. Odd Even Jump
 * https://leetcode.com/problems/odd-even-jump/
 * Difficulty: Hard
 *
 * You are given an integer array arr. From some starting index, you can make a series of
jumps.
 * The (1st, 3rd, 5th, ...) jumps in the series are called odd-numbered jumps, and the (2nd,
 * 4th, 6th, ...) jumps in the series are called even-numbered jumps. Note that the jumps are
 * numbered, not the indices.
 *
 * You may jump forward from index i to index j (with i < j) in the following way:
 * - During odd-numbered jumps (i.e., jumps 1, 3, 5, ...), you jump to the index j such that
 *   arr[i] <= arr[j] and arr[j] is the smallest possible value. If there are multiple such
 *   indices j, you can only jump to the smallest such index j.
 * - During even-numbered jumps (i.e., jumps 2, 4, 6, ...), you jump to the index j such that
 *   arr[i] >= arr[j] and arr[j] is the largest possible value. If there are multiple such
 *   indices j, you can only jump to the smallest such index j.
 * - It may be the case that for some index i, there are no legal jumps.
 *
 * A starting index is good if, starting from that index, you can reach the end of the array
(index
 * arr.length - 1) by jumping some number of times (possibly 0 or more than once).
 *
 * Return the number of good starting indices.
 */

/**
 * @param {number[]} arr

    }
  }

  return 0;
};
```

0977 Squares Of A Sorted Array

EASY

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 977. Squares of a Sorted Array
 * https://leetcode.com/problems/squares-of-a-sorted-array/
 * Difficulty: Easy
 *
 * Given an array of integers A sorted in non-decreasing order,
```

```
 * return an array of the squares of each number,
 * also in sorted non-decreasing order.
 */

/**
 * @param {number[]} A
 * @return {number[]}
 */
var sortedSquares = function(A) {
  return A.map(n => Math.pow(n, 2)).sort((a, b) => a - b);
};
```

0978 Longest Turbulent Subarray

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 978. Longest Turbulent Subarray
 * https://leetcode.com/problems/longest-turbulent-subarray/
 * Difficulty: Medium
 *
 * Given an integer array arr, return the length of a maximum size turbulent subarray of arr.
 *
 * A subarray is turbulent if the comparison sign flips between each adjacent pair of elements
 * in the subarray.
 *
 * More formally, a subarray [arr[i], arr[i + 1], ..., arr[j]] of arr is said to be turbulent
 * if and only if:
 * - For i <= k < j:
 *   - arr[k] > arr[k + 1] when k is odd, and
 *   - arr[k] < arr[k + 1] when k is even.
 * - Or, for i <= k < j:
 *   - arr[k] > arr[k + 1] when k is even, and
 *   - arr[k] < arr[k + 1] when k is odd.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
var maxTurbulenceSize = function(arr) {

```

0981 Time Based Key Value Store

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 981. Time Based Key-Value Store
 * https://leetcode.com/problems/time-based-key-value-store/
 * Difficulty: Medium
 *
 * Design a time-based key-value data structure that can store multiple values for the same
key
 * at different time stamps and retrieve the key's value at a certain timestamp.
 *
 * Implement the TimeMap class:
 * - TimeMap() Initializes the object of the data structure.
 * - void set(String key, String value, int timestamp) Stores the key key with the value value
 *   at the given time timestamp.
 * - String get(String key, int timestamp) Returns a value such that set was called
previously,
 *   with timestamp_prev <= timestamp. If there are multiple such values, it returns the value
 *   associated with the largest timestamp_prev. If there are no values, it returns "".
 */

var TimeMap = function() {
  this.store = new Map();
};

/**
 * @param {string} key
 * @param {string} value
 * @param {number} timestamp
 * @return {void}
 */
```

```
TimeMap.prototype.set = function(key, value, timestamp) {
  if (!this.store.has(key)) this.store.set(key, []);
  this.store.get(key).push([timestamp, value]);
};

/**
 * @param {string} key
 * @param {number} timestamp
 * @return {string}
 */
TimeMap.prototype.get = function(key, timestamp) {

      }
    }
  }

  return result;
```

```
};
```

0983 Minimum Cost For Tickets

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 983. Minimum Cost For Tickets
 * https://leetcode.com/problems/minimum-cost-for-tickets/
 * Difficulty: Medium
 *
 * You have planned some train traveling one year in advance. The days of the year in which
you will
 * travel are given as an integer array days. Each day is an integer from 1 to 365.
 *
 * Train tickets are sold in three different ways:
 * - a 1-day pass is sold for costs[0] dollars,
 * - a 7-day pass is sold for costs[1] dollars, and
 * - a 30-day pass is sold for costs[2] dollars.
 *
 * The passes allow that many days of consecutive travel.
 *
 * For example, if we get a 7-day pass on day 2, then we can travel for 7 days: 2, 3, 4, 5, 6,
 7,
 * and 8.
 *
 * Return the minimum number of dollars you need to travel every day in the given list of
days.
 */

/**
 * @param {number[]} days
 * @param {number[]} costs
 * @return {number}
 */

    const sevenDayCost = minCost[Math.max(0, day - 7)] + costs[1];
    const thirtyDayCost = minCost[Math.max(0, day - 30)] + costs[2];

    minCost[day] = Math.min(oneDayCost, sevenDayCost, thirtyDayCost);
  }

  return minCost[lastDay];
};
```

0984 String Without Aaa Or Bbb

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 984. String Without AAA or BBB
 * https://leetcode.com/problems/string-without-aaa-or-bbb/
 * Difficulty: Medium
 *
```

```
 * Given two integers a and b, return any string s such that:
 * - s has length a + b and contains exactly a 'a' letters, and exactly b 'b' letters,
 * - The substring 'aaa' does not occur in s, and
 * - The substring 'bbb' does not occur in s.
 */

/**
 * @param {number} a
 * @param {number} b
 * @return {string}
 */
var strWithout3a3b = function(a, b) {
  let result = '';

  while (a > 0 || b > 0) {
    if (a > b && a > 0 && !result.endsWith('aa')) {
      result += 'a';
      a--;
    } else if (b > 0 && !result.endsWith('bb')) {
      result += 'b';
      b--;
    } else if (a > 0) {
      result += 'a';
      a--;
    } else {
      result += 'b';
      b--;
    }
  }

  return result;
};
```

0985 Sum Of Even Numbers After Queries

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 985. Sum of Even Numbers After Queries
 * https://leetcode.com/problems/sum-of-even-numbers-after-queries/
 * Difficulty: Easy
 *
 * We have an array A of integers, and an array queries of queries.
 *
 * For the i-th query val = queries[i][0], index = queries[i][1],
 * we add val to A[index].  Then, the answer to the i-th query
 * is the sum of the even values of A.
 *
 * (Here, the given index = queries[i][1] is a 0-based index, and
 * each query permanently modifies the array A.)
 *
 * Return the answer to all queries. Your answer array should
 * have answer[i] as the answer to the i-th query.
 */

/**
 * @param {number[]} A
 * @param {number[][]} queries
 * @return {number[]}
 */

  const [judge, count] = [...map].sort(([,a], [,b]) => b - a)[0];
  return count === n - 1  && !trust.find(([key]) => key === judge) ? judge : -1;
};
```

0998 Maximum Binary Tree Ii

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 998. Maximum Binary Tree II
 * https://leetcode.com/problems/maximum-binary-tree-ii/
 * Difficulty: Medium
 *
 * A maximum tree is a tree where every node has a value greater than any other value
 * in its subtree.
 *
 * You are given the root of a maximum binary tree and an integer val.
 *
 * Just as in the previous problem, the given tree was constructed from a list a
 * (root = Construct(a)) recursively with the following Construct(a) routine:
 * - If a is empty, return null.
 * - Otherwise, let a[i] be the largest element of a. Create a root node with the value a[i].
 * - The left child of root will be Construct([a[0], a[1], ..., a[i - 1]]).
 * - The right child of root will be Construct([a[i + 1], a[i + 2], ..., a[a.length - 1]]).
 * - Return root.
 *
 * Note that we were not given a directly, only a root node root = Construct(a).
 *
 * Suppose b is a copy of a with the value val appended to it. It is guaranteed that b has
 * unique values.
 *
 * Return Construct(b).
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }

```

1001 Grid Illumination

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1001. Grid Illumination
 * https://leetcode.com/problems/grid-illumination/
 * Difficulty: Hard
 *
 * There is a 2D grid of size n x n where each cell of this grid has a lamp that is initially
 * turned off.
 *
 * You are given a 2D array of lamp positions lamps, where lamps[i] = [rowi, coli] indicates
that
 * the lamp at grid[rowi][coli] is turned on. Even if the same lamp is listed more than once,
it
```

```
 * is turned on.
 *
 * When a lamp is turned on, it illuminates its cell and all other cells in the same row,
column,
 * or diagonal.
 *
 * You are also given another 2D array queries, where queries[j] = [rowj, colj]. For the jth
query,
 * determine whether grid[rowj][colj] is illuminated or not. After answering the jth query,
turn off
 * the lamp at grid[rowj][colj] and its 8 adjacent lamps if they exist. A lamp is adjacent if
its
 * cell shares either a side or corner with grid[rowj][colj].
 *
 * Return an array of integers ans, where ans[j] should be 1 if the cell in the jth query was
 * illuminated, or 0 if the lamp was not.
 */

```

1006 Clumsy Factorial

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1006. Clumsy Factorial
 * https://leetcode.com/problems/clumsy-factorial/
 * Difficulty: Medium
 *
 * The factorial of a positive integer n is the product of all positive integers less
 * than or equal to n.
 * - For example, factorial(10) = 10 * 9 * 8 * 7 * 6 * 5 * 4 * 3 * 2 * 1.
 *
 * We make a clumsy factorial using the integers in decreasing order by swapping out the
 * multiply operations for a fixed rotation of operations with multiply '*', divide '/',
 * add '+', and subtract '-' in this order.
 * - For example, clumsy(10) = 10 * 9 / 8 + 7 - 6 * 5 / 4 + 3 - 2 * 1.
 *
 * However, these operations are still applied using the usual order of operations of
 * arithmetic. We do all multiplication and division steps before any addition or
 * subtraction steps, and multiplication and division steps are processed left to right.
 *
 * Additionally, the division that we use is floor division such that 10 * 9 / 8 = 90 / 8 =
11.
 *
 * Given an integer n, return the clumsy factorial of n.
 */

/**
 * @param {number} n
 * @return {number}
 */
var clumsy = function(n) {
  if (n <= 2) return n;
  if (n === 3) return 6;

  let result = Math.floor(n * (n - 1) / (n - 2)) + (n - 3);
  n -= 4;

  while (n >= 4) {
    result -= Math.floor(n * (n - 1) / (n - 2)) - (n - 3);
    n -= 4;
  }

  if (n === 3) result -= 6;
  else if (n === 2) result -= 2;
  else if (n === 1) result -= 1;

  return result;
};
```

1007 Minimum Domino Rotations For Equal Row

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

    return node;
  }
};
```

1009 Complement Of Base 10 Integer

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1009. Complement of Base 10 Integer
 * https://leetcode.com/problems/complement-of-base-10-integer/
 * Difficulty: Easy
 *
 * Every non-negative integer N has a binary representation.
 * For example, 5 can be represented as "101" in binary,
 * 11 as "1011" in binary, and so on.  Note that except for
 * N = 0, there are no leading zeroes in any binary representation.
 *
 * The complement of a binary representation is the number in binary
 * you get when changing every 1 to a 0 and 0 to a 1. For example,
 * the complement of "101" in binary is "010" in binary.
 *
 * For a given number N in base-10, return the complement of it's
 * binary representation as a base-10 integer.
 */

/**
 * @param {number} N
 * @return {number}
 */
var bitwiseComplement = function(N) {
  return parseInt(N.toString(2).split('').map(n => n ^ 1).join(''), 2);
};
```

1010 Pairs Of Songs With Total Durations Divisible By 60

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1010. Pairs of Songs With Total Durations Divisible by 60
 * https://leetcode.com/problems/pairs-of-songs-with-total-durations-divisible-by-60/
 * Difficulty: Medium
 *
 * You are given a list of songs where the ith song has a duration of time[i] seconds.
 *
 * Return the number of pairs of songs for which their total duration in seconds is
 * divisible by 60. Formally, we want the number of indices i, j such that i < j with
 * (time[i] + time[j]) % 60 == 0.
 */

/**
 * @param {number[]} time
 * @return {number}
 */
var numPairsDivisibleBy60 = function(time) {
  const mods = new Array(60).fill(0);
```

```
  return time.reduce((sum, t) => {
    sum += mods[(60 - t % 60) % 60];
    mods[t % 60]++;
    return sum;
  }, 0);
};
```

1011 Capacity To Ship Packages Within D Days

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1011. Capacity To Ship Packages Within D Days
 * https://leetcode.com/problems/capacity-to-ship-packages-within-d-days/
 * Difficulty: Medium
 *
 * A conveyor belt has packages that must be shipped from one port to another within days
days.
 *
 * The ith package on the conveyor belt has a weight of weights[i]. Each day, we load the ship
 * with packages on the conveyor belt (in the order given by weights). We may not load more
weight
 * than the maximum weight capacity of the ship.
 *
 * Return the least weight capacity of the ship that will result in all the packages on the
conveyor
 * belt being shipped within days days.
 */

/**
 * @param {number[]} weights
 * @param {number} days
 * @return {number}
 */
var shipWithinDays = function(weights, days) {
  let left = Math.max(...weights);

  }
  return dfs(node.left, str) + dfs(node.right, str);
}
```

1023 Camelcase Matching

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1023. Camelcase Matching
 * https://leetcode.com/problems/camelcase-matching/
 * Difficulty: Medium
 *
 * Given an array of strings queries and a string pattern, return a boolean array answer
 * where answer[i] is true if queries[i] matches pattern, and false otherwise.
 *
 * A query word queries[i] matches pattern if you can insert lowercase English letters
 * pattern so that it equals the query. You may insert each character at any position
 * and you may not insert any characters.
 */

/**
 * @param {string[]} queries
 * @param {string} pattern
 * @return {boolean[]}
 */
var camelMatch = function(queries, pattern) {
  return queries.map(s => s.match(pattern.split(/(.)/).join('[a-z]*'))?.at(0) === s);
};
```

1024 Video Stitching

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1024. Video Stitching
 * https://leetcode.com/problems/video-stitching/
 * Difficulty: Medium
 *
 * You are given a series of video clips from a sporting event that lasted time seconds.
 * These video clips can be overlapping with each other and have varying lengths.
 *
 * Each video clip is described by an array clips where clips[i] = [starti, endi] indicates
 * that the ith clip started at starti and ended at endi.
 *
 * We can cut these clips into segments freely.
 * - For example, a clip [0, 7] can be cut into segments [0, 1] + [1, 3] + [3, 7].
 *
 * Return the minimum number of clips needed so that we can cut the clips into segments that
 * cover the entire sporting event [0, time]. If the task is impossible, return -1.
 */

/**
 * @param {number[][]} clips
 * @param {number} time
 * @return {number}
 */

1032 Stream Of Characters

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1032. Stream of Characters
 * https://leetcode.com/problems/stream-of-characters/
 * Difficulty: Hard
 *
 * Design an algorithm that accepts a stream of characters and checks if a suffix of these
 * characters is a string of a given array of strings words.
 *
 * For example, if words = ["abc", "xyz"] and the stream added the four characters (one by
one)
 * 'a', 'x', 'y', and 'z', your algorithm should detect that the suffix "xyz" of the
characters
 * "axyz" matches "xyz" from words.
 *
 * Implement the StreamChecker class:
 * - StreamChecker(String[] words) Initializes the object with the strings array words.
 * - boolean query(char letter) Accepts a new character from the stream and returns true if
any
 *   non-empty suffix from the stream forms a word that is in words.
 */

/**
 * @param {string[]} words
 */
var StreamChecker = function(words) {
  this.trie = {};
  this.stream = [];

  words.forEach(word => buildTrie(word, this.trie));
```

```
  function buildTrie(word, trie) {
    let node = trie;
    for (let i = word.length - 1; i >= 0; i--) {
      const char = word[i];
      node[char] = node[char] || {};
      node = node[char];
    }
    node.isEnd = true;
  }
};

/**
 * @param {character} letter
 * @return {boolean}
 */
StreamChecker.prototype.query = function(letter) {
  this.stream.push(letter);

    const char = this.stream[i];
    if (!node[char]) return false;
    node = node[char];
    if (node.isEnd) return true;
  }

  return false;
};
```

1033 Moving Stones Until Consecutive

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1033. Moving Stones Until Consecutive
 * https://leetcode.com/problems/moving-stones-until-consecutive/
 * Difficulty: Medium
 *
 * There are three stones in different positions on the X-axis. You are given three integers
a, b,
 * and c, the positions of the stones.
 *
 * In one move, you pick up a stone at an endpoint (i.e., either the lowest or highest
position
 * stone), and move it to an unoccupied position between those endpoints. Formally, let's say
the
 * stones are currently at positions x, y, and z with x < y < z. You pick up the stone at
either
 * position x or position z, and move that stone to an integer position k, with x < k < z and
 * k != y.
 *
 * The game ends when you cannot make any more moves (i.e., the stones are in three
consecutive
 * positions).
 *
 * Return an integer array answer of length 2 where:
 * - answer[0] is the minimum number of moves you can play, and
 * - answer[1] is the maximum number of moves you can play.
 */

/**
 * @param {number} a
 * @param {number} b
 * @param {number} c
 * @return {number[]}
 */

```

1056 Confusing Number

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1056. Confusing Number
 * https://leetcode.com/problems/confusing-number/
 * Difficulty: Easy
 *
 * A confusing number is a number that when rotated 180 degrees becomes a different number
with
 * each digit valid.
 *
 * We can rotate digits of a number by 180 degrees to form new digits.
 * - When 0, 1, 6, 8, and 9 are rotated 180 degrees, they become 0, 1, 9, 8, and 6
respectively.
 * - When 2, 3, 4, 5, and 7 are rotated 180 degrees, they become invalid.
 *
 * Note that after rotating a number, we can ignore leading zeros.
 * - For example, after rotating 8000, we have 0008 which is considered as just 8.
```

```
 *
 * Given an integer n, return true if it is a confusing number, or false otherwise.
 */

/**
 * @param {number} n
 * @return {boolean}
 */
var confusingNumber = function(n) {
  const rotationMap = { '0': '0', '1': '1', '6': '9', '8': '8', '9': '6' };

  for (let i = digits.length - 1; i >= 0; i--) {
    if (!(digits[i] in rotationMap)) {
      return false;
    }
    rotated += rotationMap[digits[i]];
  }

  return parseInt(rotated, 10) !== n;
};
```

1057 Campus Bikes

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1057. Campus Bikes
 * https://leetcode.com/problems/campus-bikes/
 * Difficulty: Medium
 *
 * On a campus represented on the X-Y plane, there are n workers and m bikes, with n <= m.
 *
 * You are given an array workers of length n where workers[i] = [xi, yi] is the position of
 * the ith worker. You are also given an array bikes of length m where bikes[j] = [xj, yj]
 * is the position of the jth bike. All the given positions are unique.
 *
 * Assign a bike to each worker. Among the available bikes and workers, we choose the
 * (workeri, bikej) pair with the shortest Manhattan distance between each other and assign
 * the bike to that worker.
 *
 * If there are multiple (workeri, bikej) pairs with the same shortest Manhattan distance,
 * we choose the pair with the smallest worker index. If there are multiple ways to do that,
 * we choose the pair with the smallest bike index. Repeat this process until there are no
 * available workers.
 *
 * Return an array answer of length n, where answer[i] is the index (0-indexed) of the bike
 * that the ith worker is assigned to.
 *
 * The Manhattan distance between two points p1 and p2 is
 * Manhattan(p1, p2) = |p1.x - p2.x| + |p1.y - p2.y|.
 */

/**

```

1061 Lexicographically Smallest Equivalent String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1061. Lexicographically Smallest Equivalent String
 * https://leetcode.com/problems/lexicographically-smallest-equivalent-string/
 * Difficulty: Medium
 *
 * You are given two strings of the same length s1 and s2 and a string baseStr.
 *
 * We say s1[i] and s2[i] are equivalent characters.
 * - For example, if s1 = "abc" and s2 = "cde", then we have 'a' == 'c', 'b' == 'd', and 'c'
== 'e'.
 *
```

```
 * Equivalent characters follow the usual rules of any equivalence relation:
 * - Reflexivity: 'a' == 'a'.
 * - Symmetry: 'a' == 'b' implies 'b' == 'a'.
 * - Transitivity: 'a' == 'b' and 'b' == 'c' implies 'a' == 'c'.
 *
 * For example, given the equivalency information from s1 = "abc" and s2 = "cde", "acd" and
"aab"
 * are equivalent strings of baseStr = "eed", and "aab" is the lexicographically smallest
equivalent
 * string of baseStr.
 *
 * Return the lexicographically smallest equivalent string of baseStr by using the equivalency
 * information from s1 and s2.
 */

/**
 * @param {string} s1
 * @param {string} s2
 * @param {string} baseStr
 * @return {string}
 */
var smallestEquivalentString = function(s1, s2, baseStr) {
  const parent = Array(26).fill().map((_, i) => i);

  for (let i = 0; i < s1.length; i++) {
    union(s1.charCodeAt(i) - 97, s2.charCodeAt(i) - 97);
  }

  return baseStr.split('')
    .map(char => String.fromCharCode(97 + find(char.charCodeAt(0) - 97)))
    .join('');

  function find(x) {
    if (parent[x] !== x) {
      parent[x] = find(parent[x]);
    }
    return parent[x];
  }

  function union(x, y) {
    const rootX = find(x);

    if (rootX < rootY) {
      parent[rootY] = rootX;
    } else if (rootX > rootY) {
      parent[rootX] = rootY;
    }
  }
};
```

1062 Longest Repeating Substring

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1062. Longest Repeating Substring
 * https://leetcode.com/problems/longest-repeating-substring/
 * Difficulty: Medium
 *
 * Given a string s, return the length of the longest repeating substrings. If no repeating
 * substring exists, return 0.
 */

/**
 * @param {string} s
 * @return {number}
 */
var longestRepeatingSubstring = function(s) {
  const n = s.length;
  const dp = new Array(n + 1).fill(null).map(() => new Array(n + 1).fill(0));
```

```
  let result = 0;

  for (let i = 1; i <= n; i++) {
    for (let j = 1; j <= n; j++) {
      if (i !== j && s[i - 1] === s[j - 1]) {
        dp[i][j] = dp[i - 1][j - 1] + 1;
        result = Math.max(result, dp[i][j]);
      }
    }
  }

  return result;
};
```

1063 Number Of Valid Subarrays

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1063. Number of Valid Subarrays
 * https://leetcode.com/problems/number-of-valid-subarrays/
 * Difficulty: Hard
 *
 * Given an integer array nums, return the number of non-empty subarrays with the leftmost
 * element of the subarray not larger than other elements in the subarray.
 *
 * A subarray is a contiguous part of an array.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var validSubarrays = function(nums) {
  const n = nums.length;

      result = mid;
      right = mid - 1;
    } else if (arr[mid] < mid) {
      left = mid + 1;
    } else {
      right = mid - 1;
    }
  }

  return result;
};
```

1065 Index Pairs Of A String

EASY

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1065. Index Pairs of a String
 * https://leetcode.com/problems/index-pairs-of-a-string/
 * Difficulty: Easy
 *
 * Given a string text and an array of strings words, return an array of all index
 * pairs [i, j] so that the substring text[i...j] is in words.
 *
 * Return the pairs [i, j] in sorted order (i.e., sort them by their first coordinate,
 * and in case of ties sort them by their second coordinate).
 */

/**
 * @param {string} text
 * @param {string[]} words
 * @return {number[][]}
 */
var indexPairs = function(text, words) {
  const result = [];
  const wordSet = new Set(words);

  for (let i = 0; i < text.length; i++) {
    for (let j = i; j < text.length; j++) {
      const substring = text.slice(i, j + 1);
      if (wordSet.has(substring)) {
        result.push([i, j]);
      }
    }
  }

  return result;
};
```

1066 Campus Bikes Ii

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 1066. Campus Bikes II
 * https://leetcode.com/problems/campus-bikes-ii/
 * Difficulty: Medium
 *
 * On a campus represented as a 2D grid, there are n workers and m bikes, with n <= m.
 * Each worker and bike is a 2D coordinate on this grid.
 *
 * We assign one unique bike to each worker so that the sum of the Manhattan distances
 * between each worker and their assigned bike is minimized.
 *
 * Return the minimum possible sum of Manhattan distances between each worker and their
 * assigned bike.
 *
 * The Manhattan distance between two points p1 and p2 is
 * Manhattan(p1, p2) = |p1.x - p2.x| + |p1.y - p2.y|.
 */

/**

    .reduce((sum, digit) => sum + parseInt(digit), 0);

  return digitSum % 2 === 0 ? 1 : 0;
};
```

1086 High Five

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1086. High Five
 * https://leetcode.com/problems/high-five/
 * Difficulty: Easy
 *
 * Given a list of the scores of different students, items, where items[i] = [IDi, scorei]
 * represents one score from a student with IDi, calculate each student's top five average.
 *
 * Return the answer as an array of pairs result, where result[j] = [IDj, topFiveAveragej]
 * represents the student with IDj and their top five average. Sort result by IDj in
 * increasing order.
 *
 * A student's top five average is calculated by taking the sum of their top five scores
 * and dividing it by 5 using integer division.
 */

/**
 * @param {number[][]} items
 * @return {number[][]}
 */
var highFive = function(items) {
  const studentScores = new Map();

  for (const [id, score] of items) {
    if (!studentScores.has(id)) {
      studentScores.set(id, []);
    }
    studentScores.get(id).push(score);
  }

  const result = [];
  for (const [id, scores] of studentScores) {
    scores.sort((a, b) => b - a);
    const topFiveSum = scores.slice(0, 5).reduce((sum, score) => sum + score, 0);
    const average = Math.floor(topFiveSum / 5);
    result.push([id, average]);
  }

  result.sort((a, b) => a[0] - b[0]);

  return result;
};
```

1087 Brace Expansion

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1087. Brace Expansion
 * https://leetcode.com/problems/brace-expansion/
 * Difficulty: Medium
 *
 * You are given a string s representing a list of words. Each letter in the word has
 * one or more options.
 * - If there is one option, the letter is represented as is.
 * - If there is more than one option, then curly braces delimit the options.
 *   For example, "{a,b,c}" represents options ["a", "b", "c"].
 *
 * For example, if s = "a{b,c}", the first character is always 'a', but the second
 * character can be 'b' or 'c'. The original list is ["ab", "ac"].
 *
 * Return all words that can be formed in this manner, sorted in lexicographical order.
 */

1088 Confusing Number Ii

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 1088. Confusing Number II
 * https://leetcode.com/problems/confusing-number-ii/
 * Difficulty: Hard
 *
 * A confusing number is a number that when rotated 180 degrees becomes a different number
 * with each digit valid.
 *
 * We can rotate digits of a number by 180 degrees to form new digits.
 * - When 0, 1, 6, 8, and 9 are rotated 180 degrees, they become 0, 1, 9, 8, and 6
respectively.
 * - When 2, 3, 4, 5, and 7 are rotated 180 degrees, they become invalid.
 *
 * Note that after rotating a number, we can ignore leading zeros.
 * - For example, after rotating 8000, we have 0008 which is considered as just 8.
 *
 * Given an integer n, return the number of confusing numbers in the inclusive range [1, n].
 */

/**
 * @param {number} n
 * @return {number}
 */
var confusingNumberII = function(n) {
  const validDigits = [0, 1, 6, 8, 9];

```

1093 Statistics From A Large Sample

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1093. Statistics from a Large Sample
 * https://leetcode.com/problems/statistics-from-a-large-sample/
 * Difficulty: Medium
```

```
 *
 * You are given a large sample of integers in the range [0, 255]. Since the sample is so
large,
 * it is represented by an array count where count[k] is the number of times that k appears in
 * the sample.
 *
 * Calculate the following statistics:
 * - minimum: The minimum element in the sample.
 * - maximum: The maximum element in the sample.
 * - mean: The average of the sample, calculated as the total sum of all elements divided by
the
 *   total number of elements.
 * - median:
 *   - If the sample has an odd number of elements, then the median is the middle element once
 *     the sample is sorted.
 *   - If the sample has an even number of elements, then the median is the average of the two
 *     middle elements once the sample is sorted.
 * - mode: The number that appears the most in the sample. It is guaranteed to be unique.
 *
 * Return the statistics of the sample as an array of floating-point numbers [minimum,
maximum,
 * mean, median, mode]. Answers within 10-5 of the actual answer will be accepted.
 */

1096 Brace Expansion Ii

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1096. Brace Expansion II
 * https://leetcode.com/problems/brace-expansion-ii/
 * Difficulty: Hard
 *
```

```
 * Under the grammar given below, strings can represent a set of lowercase words. Let R(expr)
 * denote the set of words the expression represents.
 *
 * The grammar can best be understood through simple examples:
 * - Single letters represent a singleton set containing that word.
 *   - R("a") = {"a"}
 *   - R("w") = {"w"}
 * - When we take a comma-delimited list of two or more expressions, we take the union of
 *   possibilities.
 *   - R("{a,b,c}") = {"a","b","c"}
 *   - R("{{a,b},{b,c}}") = {"a","b","c"} (notice the final set only contains each word
 *     at most once)
 * - When we concatenate two expressions, we take the set of possible concatenations between
two
 *   words where the first word comes from the first expression and the second word comes from
 *   the second expression.
 *   - R("{a,b}{c,d}") = {"ac","ad","bc","bd"}
 *   - R("a{b,c}{d,e}f{g,h}") = {"abdfg", "abdfh", "abefg", "abefh", "acdfg", "acdfh",
 *     "acefg", "acefh"}
 *
 * Formally, the three rules for our grammar:
 * - For every lowercase letter x, we have R(x) = {x}.
 * - For expressions e1, e2, ... , ek with k >= 2, we have R({e1, e2, ...}) = R(e1) ∪ R(e2) ∪
...
 * - For expressions e1 and e2, we have R(e1 + e2) = {a + b for (a, b) in R(e1) × R(e2)},
 *   where + denotes concatenation, and × denotes the cartesian product.
 *
 * Given an expression representing a set of words under the given grammar, return the sorted
list
 * of words that the expression represents.
 */

      }
    }
  }

  return -1;
};
```

1103 Distribute Candies To People

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1103. Distribute Candies to People
 * https://leetcode.com/problems/distribute-candies-to-people/
 * Difficulty: Easy
 *
 * We distribute some number of `candies`, to a row of `n = num_people`
 * people in the following way:
 *
 * We then give 1 candy to the first person, 2 candies to the second
 * person, and so on until we give `n` candies to the last person.
 *
 * Then, we go back to the start of the row, giving `n + 1` candies to
 * the first person, `n + 2` candies to the second person, and so on
 * until we give `2 * n` candies to the last person.
 *
 * This process repeats (with us giving one more candy each time,
 * and moving to the start of the row after we reach the end) until
 * we run out of candies. The last person will receive all of our
 * remaining candies (not necessarily one more than the previous gift).
 *
 * Return an array (of length `num_people` and sum `candies`) that
 * represents the final distribution of candies.
 */

/**
 * @param {number} candies
 * @param {number} num_people
 * @return {number[]}
 */
var distributeCandies = function(candies, num_people) {
  const answer = new Array(num_people).fill(0);

  for (let amount = 0; candies > 0; candies -= amount) {
    answer[amount % num_people] += Math.min(candies, ++amount);
```

```
  }

  return answer;
};
```

1104 Path In Zigzag Labelled Binary Tree

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1104. Path In Zigzag Labelled Binary Tree
 * https://leetcode.com/problems/path-in-zigzag-labelled-binary-tree/
 * Difficulty: Medium
 *
 * In an infinite binary tree where every node has two children, the nodes are labelled
 * in row order.
 *
 * In the odd numbered rows (ie., the first, third, fifth,...), the labelling is left to
right,
 * while in the even numbered rows (second, fourth, sixth,...), the labelling is right to
left.
 *
 * Given the label of a node in this tree, return the labels in the path from the root of the
 * tree to the node with that label.
 */

/**
 * @param {number} label
 * @return {number[]}
 */
var pathInZigZagTree = function(label) {
  const result = [];
  let current = label;

  while (current >= 1) {
    result.unshift(current);

    current = Math.floor(((2 ** (level + 1)) - 1 + (2 ** level) - current) / 2);
  }

  return result;
};
```

1105 Filling Bookcase Shelves

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1105. Filling Bookcase Shelves
 * https://leetcode.com/problems/filling-bookcase-shelves/
 * Difficulty: Medium
 *
 * You are given an array books where books[i] = [thicknessi, heighti] indicates the thickness
 * and height of the ith book. You are also given an integer shelfWidth.
 *
 * We want to place these books in order onto bookcase shelves that have a total width
shelfWidth.
 *
 * We choose some of the books to place on this shelf such that the sum of their thickness is
less
 * than or equal to shelfWidth, then build another level of the shelf of the bookcase so that
the
 * total height of the bookcase has increased by the maximum height of the books we just put
down.
 * We repeat this process until there are no more books to place.
```

```
 *
 * Note that at each step of the above process, the order of the books we place is the same
order
 * as the given sequence of books.
 *
 * For example, if we have an ordered list of 5 books, we might place the first and second
book
 * onto the first shelf, the third book on the second shelf, and the fourth and fifth book on
the
 * last shelf.
 *
 * Return the minimum possible height that the total bookshelf can be after placing shelves in
 * this manner.
 */

/**
 * @param {number[][]} books
 * @param {number} shelfWidth
 * @return {number}
 */
var minHeightShelves = function(books, shelfWidth) {
  const dp = new Array(books.length + 1).fill(0);

  for (let i = 1; i <= books.length; i++) {
    let width = books[i - 1][0];
    let height = books[i - 1][1];
    dp[i] = dp[i - 1] + height;

    let j = i - 2;
    while (j >= 0 && width + books[j][0] <= shelfWidth) {
      width += books[j][0];

  const result = new Array(n).fill(0);

  for (const [start, end, count] of bookings) {
    result[start - 1] += count;
    if (end < n) result[end] -= count;
  }

  for (let i = 1; i < n; i++) {
    result[i] += result[i - 1];
  }

  return result;
};
```

1110 Delete Nodes And Return Forest

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 1110. Delete Nodes And Return Forest
 * https://leetcode.com/problems/delete-nodes-and-return-forest/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, each node in the tree has a distinct value.
 *
 * After deleting all nodes with a value in toDelete, we are left with a forest (a disjoint
 * union of trees).
 *
 * Return the roots of the trees in the remaining forest. You may return the result in any
order.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 * @param {number[]} toDelete
 * @return {TreeNode[]}
 */
var delNodes = function(root, toDelete) {
  const deleteSet = new Set(toDelete);
  const forest = [];
```

```
  traverse(root, true);
  return forest;

  function traverse(node, isRoot) {
    if (!node) return null;

    const shouldDelete = deleteSet.has(node.val);
    if (isRoot && !shouldDelete) forest.push(node);

    node.left = traverse(node.left, shouldDelete);
    node.right = traverse(node.right, shouldDelete);

    return shouldDelete ? null : node;
  }
};
```

1111 Maximum Nesting Depth Of Two Valid Parentheses Strings

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1111. Maximum Nesting Depth of Two Valid Parentheses Strings
 * https://leetcode.com/problems/maximum-nesting-depth-of-two-valid-parentheses-strings/
 * Difficulty: Medium
 *
 * A string is a valid parentheses string (denoted VPS) if and only if it consists of "(" and
")"
 * characters only, and:
 * - It is the empty string, or
 * - It can be written as AB (A concatenated with B), where A and B are VPS's, or
 * - It can be written as (A), where A is a VPS.
 *
 * We can similarly define the nesting depth depth(S) of any VPS S as follows:
 * - depth("") = 0
 * - depth(A + B) = max(depth(A), depth(B)), where A and B are VPS's
 * - depth("(" + A + ")") = 1 + depth(A), where A is a VPS.
 *
 * For example,  "", "()()", and "()(()())" are VPS's (with nesting depths 0, 1, and 2),
 * and ")(" and "(()" are not VPS's.
 *
 * Given a VPS seq, split it into two disjoint subsequences A and B, such that A and B are
VPS's
 * (and A.length + B.length = seq.length).
 *
 * Now choose any such A and B such that max(depth(A), depth(B)) is the minimum possible
value.
 *
 * Return an answer array (of length seq.length) that encodes such a choice of A and B:
 * answer[i] = 0 if seq[i] is part of A, else answer[i] = 1.  Note that even though multiple
 * answers may exist, you may return any of them.
 */

/**
 * @param {string} seq
 * @return {number[]}
 */
var maxDepthAfterSplit = function(seq) {
  const result = new Array(seq.length);
  let depth = 0;

  for (let i = 0; i < seq.length; i++) {
    if (seq[i] === '(') {
      result[i] = depth++ % 2;
    } else {
      result[i] = --depth % 2;
    }
  }

  return result;
};
```

1118 Number Of Days In A Month

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**

    currentFrequency = nums[i] === nums[i - 1] ? currentFrequency + 1 : 1;
    maxFrequency = Math.max(maxFrequency, currentFrequency);
  }

  return k * maxFrequency <= nums.length;
};
```

1122 Relative Sort Array

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1122. Relative Sort Array
 * https://leetcode.com/problems/relative-sort-array/
 * Difficulty: Easy
 *
 * Given two arrays arr1 and arr2, the elements of arr2 are distinct, and all
 * elements in arr2 are also in arr1.
 *
 * Sort the elements of arr1 such that the relative ordering of items in arr1
 * are the same as in arr2. Elements that do not appear in arr2 should be
 * placed at the end of arr1 in ascending order.
 */

/**
 * @param {number[]} arr1
 * @param {number[]} arr2
 * @return {number[]}
 */
var relativeSortArray = function(arr1, arr2) {
  const map = new Map(arr2.map((v, i) => [v, i]));
  return arr1.sort((a, b) => (map.get(a) ?? arr2.length + a) - (map.get(b) ?? arr2.length +
b));
};
```

1123 Lowest Common Ancestor Of Deepest Leaves

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1123. Lowest Common Ancestor of Deepest Leaves
 * https://leetcode.com/problems/lowest-common-ancestor-of-deepest-leaves/
 * Difficulty: Medium
 *
 * Given the root of a binary tree, return the lowest common ancestor of its deepest leaves.
 *
 * Recall that:
 * - The node of a binary tree is a leaf if and only if it has no children
 * - The depth of the root of the tree is 0. if the depth of a node is d, the depth of each of
 *   its children is d + 1.
 * - The lowest common ancestor of a set S of nodes, is the node A with the largest depth such
 *   that every node in S is in the subtree with root A.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }

```

1129 Shortest Path With Alternating Colors

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1129. Shortest Path with Alternating Colors
 * https://leetcode.com/problems/shortest-path-with-alternating-colors/
 * Difficulty: Medium
 *
 * You are given an integer n, the number of nodes in a directed graph where the nodes are
 * labeled from 0 to n - 1. Each edge is red or blue in this graph, and there could be
 * self-edges and parallel edges.
 *
 * You are given two arrays redEdges and blueEdges where:
 * - redEdges[i] = [ai, bi] indicates that there is a directed red edge from node ai
 *   to node bi in the graph, and
 * - blueEdges[j] = [uj, vj] indicates that there is a directed blue edge from node uj
 *   to node vj in the graph.
 *
 * Return an array answer of length n, where each answer[x] is the length of the shortest
 * path from node 0 to node x such that the edge colors alternate along the path, or -1
 * if such a path does not exist.
 */

/**
 * @param {number} n
 * @param {number[][]} redEdges
 * @param {number[][]} blueEdges
 * @return {number[]}
 */
var shortestAlternatingPaths = function(n, redEdges, blueEdges) {
  const redGraph = Array(n).fill().map(() => new Set());
  const blueGraph = Array(n).fill().map(() => new Set());

  for (const [from, to] of redEdges) redGraph[from].add(to);
  for (const [from, to] of blueEdges) blueGraph[from].add(to);

  const distances = Array(n).fill().map(() => [Infinity, Infinity]);
  const queue = [[0, 0], [0, 1]];
  distances[0] = [0, 0];

  while (queue.length) {
    const [node, color] = queue.shift();
    const nextGraph = color ? redGraph : blueGraph;
    const nextColor = 1 - color;

    for (const nextNode of nextGraph[node]) {
      if (distances[nextNode][nextColor] === Infinity) {
        distances[nextNode][nextColor] = distances[node][color] + 1;
        queue.push([nextNode, nextColor]);
      }
    }
  }

  return distances.map(([red, blue]) => {
    const min = Math.min(red, blue);
```

```
    return min === Infinity ? -1 : min;
  });
};
```

1130 Minimum Cost Tree From Leaf Values

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1130. Minimum Cost Tree From Leaf Values
 * https://leetcode.com/problems/minimum-cost-tree-from-leaf-values/
 * Difficulty: Medium
 *
 * Given an array arr of positive integers, consider all binary trees such that:
 * - Each node has either 0 or 2 children;
 * - The values of arr correspond to the values of each leaf in an in-order traversal of the
tree.
 * - The value of each non-leaf node is equal to the product of the largest leaf value in its
left
 *   and right subtree, respectively.
 *
 * Among all possible binary trees considered, return the smallest possible sum of the values
of
 * each non-leaf node. It is guaranteed this sum fits into a 32-bit integer.
 *
 * A node is a leaf if and only if it has zero children.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
var mctFromLeafValues = function(arr) {
  const stack = [];
  let result = 0;

  for (const value of arr) {
    while (stack.length && stack[stack.length - 1] <= value) {
      const small = stack.pop();

    }
    stack.push(value);
  }

  while (stack.length > 1) {
    const small = stack.pop();
    result += small * stack[stack.length - 1];
  }

  return result;
};
```

1131 Maximum Of Absolute Value Expression

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1131. Maximum of Absolute Value Expression
 * https://leetcode.com/problems/maximum-of-absolute-value-expression/
 * Difficulty: Medium
 *
 * Given two arrays of integers with equal lengths, return the maximum value of:
 * - |arr1[i] - arr1[j]| + |arr2[i] - arr2[j]| + |i - j|
 *
 * where the maximum is taken over all 0 <= i, j < arr1.length.
```

```
 */

/**
 * @param {number[]} arr1
 * @param {number[]} arr2
 * @return {number}
 */
var maxAbsValExpr = function(arr1, arr2) {
  const directions = [[1, 1], [1, -1], [-1, 1], [-1, -1]];
  let result = 0;

  for (const [dx, dy] of directions) {
    let minSeen = Infinity;
    let maxSeen = -Infinity;

    for (let i = 0; i < arr1.length; i++) {
      const value = dx * arr1[i] + dy * arr2[i] + i;
      minSeen = Math.min(minSeen, value);
      maxSeen = Math.max(maxSeen, value);
    }

    result = Math.max(result, maxSeen - minSeen);
  }

  return result;
};
```

1133 Largest Unique Number

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1133. Largest Unique Number
 * https://leetcode.com/problems/largest-unique-number/
 * Difficulty: Easy
 *
 * Given an integer array nums, return the largest integer that only occurs once.
 * If no integer occurs once, return -1.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var largestUniqueNumber = function(nums) {
  const map = new Map();

  for (const num of nums) {
    map.set(num, (map.get(num) || 0) + 1);
  }

  let result = -1;
  for (const [num, frequency] of map) {
    if (frequency === 1) {
      result = Math.max(result, num);
    }
  }

  return result;
};
```

1134 Armstrong Number

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```javascript
/**
 * 1134. Armstrong Number
 * https://leetcode.com/problems/armstrong-number/
 * Difficulty: Easy
 *
 * Given an integer n, return true if and only if it is an Armstrong number.
 *
 * The k-digit number n is an Armstrong number if and only if the kth power of each digit sums
 to n.
 */

/**
 * @param {number} n
 * @return {boolean}
 */
var isArmstrong = function(n) {
  const digits = n.toString();
  const digitCount = digits.length;
  const digitSum = digits
    .split('')
    .reduce((sum, digit) => sum + Math.pow(parseInt(digit, 10), digitCount), 0);

  return digitSum === n;
};
```

1135 Connecting Cities With Minimum Cost

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```javascript
/**
 * 1135. Connecting Cities With Minimum Cost
 * https://leetcode.com/problems/connecting-cities-with-minimum-cost/
 * Difficulty: Medium
 *
 * There are n cities labeled from 1 to n. You are given the integer n and an array
 * connections where connections[i] = [xi, yi, costi] indicates that the cost of connecting
 * city xi and city yi (bidirectional connection) is costi.
 *
 * Return the minimum cost to connect all the n cities such that there is at least one path
 * between each pair of cities. If it is impossible to connect all the n cities, return -1,
 *
 * The cost is the sum of the connections' costs used.
 */

/**
 * @param {number} n
 * @param {number[][]} connections
 * @return {number}
 */
var minimumCost = function(n, connections) {
  const parent = Array.from({ length: n + 1 }, (_, i) => i);

  connections.sort((a, b) => a[2] - b[2]);

  let totalCost = 0;
  let edgesUsed = 0;

  for (const [city1, city2, cost] of connections) {
    if (union(city1, city2)) {
      totalCost += cost;
      edgesUsed++;

      if (edgesUsed === n - 1) {
        return totalCost;
      }
    }
  }

  return -1;
```

```
  function findParent(x) {
    if (parent[x] !== x) {
      parent[x] = findParent(parent[x]);
    }
    return parent[x];
  }

  function union(x, y) {

```

1138 Alphabet Board Path

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1138. Alphabet Board Path
 * https://leetcode.com/problems/alphabet-board-path/
 * Difficulty: Medium
 *
 * On an alphabet board, we start at position (0, 0), corresponding to character board[0][0].
 *
 * Here, board = ["abcde", "fghij", "klmno", "pqrst", "uvwxy", "z"], as shown in the diagram
below.
 *
 * We may make the following moves:
 * - 'U' moves our position up one row, if the position exists on the board;
```

```
 * - 'D' moves our position down one row, if the position exists on the board;
 * - 'L' moves our position left one column, if the position exists on the board;
 * - 'R' moves our position right one column, if the position exists on the board;
 * - '!' adds the character board[r][c] at our current position (r, c) to the answer.
 *
 * (Here, the only positions that exist on the board are positions with letters on them.)
 *
 * Return a sequence of moves that makes our answer equal to target in the minimum number of
 * moves. You may return any path that does so.
 */

/**
 * @param {string} target
 * @return {string}
 */

1145 Binary Tree Coloring Game

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1145. Binary Tree Coloring Game
 * https://leetcode.com/problems/binary-tree-coloring-game/
 * Difficulty: Medium
 *
 * Two players play a turn based game on a binary tree. We are given the root of this binary
tree,
 * and the number of nodes n in the tree. n is odd, and each node has a distinct value from 1
to n.
 *
 * Initially, the first player names a value x with 1 <= x <= n, and the second player names a
 value
 * y with 1 <= y <= n and y != x. The first player colors the node with value x red, and the
second
 * player colors the node with value y blue.
 *
 * Then, the players take turns starting with the first player. In each turn, that player
chooses
 * a node of their color (red if player 1, blue if player 2) and colors an uncolored neighbor
of
 * the chosen node (either the left child, right child, or parent of the chosen node.)
 *
 * If (and only if) a player cannot choose such a node in this way, they must pass their turn.
 If
 * both players pass their turn, the game ends, and the winner is the player that colored more
 * nodes.
 *
 * You are the second player. If it is possible to choose such a y to ensure you win the game,
 * return true. If it is not possible, return false.
 */

/**

    maxOnes = Math.max(maxOnes, currentOnes);
  }

  return totalOnes - maxOnes;
};
```

1152 Analyze User Website Visit Pattern

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1152. Analyze User Website Visit Pattern
 * https://leetcode.com/problems/analyze-user-website-visit-pattern/
 * Difficulty: Medium
 *
 * You are given two string arrays username and website and an integer array timestamp.
 * All the given arrays are of the same length and the tuple [username[i], website[i],
 * timestamp[i]] indicates that the user username[i] visited the website website[i] at
 * time timestamp[i].
 *
 * A pattern is a list of three websites (not necessarily distinct).
 * - For example, ["home", "away", "love"], ["leetcode", "love", "leetcode"],
 *   and ["luffy", "luffy", "luffy"] are all patterns.
 *
 * The score of a pattern is the number of users that visited all the websites in the
 * pattern in the same order they appeared in the pattern.
 * - For example, if the pattern is ["home", "away", "love"], the score is the number of
 *   users x such that x visited "home" then visited "away" and visited "love" after that.
 * - Similarly, if the pattern is ["leetcode", "love", "leetcode"], the score is the number
 *   of users x such that x visited "leetcode" then visited "love" and visited "leetcode"
 *   one more time after that.
 * - Also, if the pattern is ["luffy", "luffy", "luffy"], the score is the number of users
 *   x such that x visited "luffy" three different times at different timestamps.
 *
 * Return the pattern with the largest score. If there is more than one pattern with the
 * same largest score, return the lexicographically smallest such pattern.
 *
 * Note that the websites in a pattern do not need to be visited contiguously, they only
 * need to be visited in the order they appeared in the pattern.
 */
```

```
/**
 * @param {string[]} username
 * @param {number[]} timestamp
 * @param {string[]} website
 * @return {string[]}
 */
var mostVisitedPattern = function(username, timestamp, website) {

1168 Optimize Water Distribution In A Village

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1168. Optimize Water Distribution in a Village
 * https://leetcode.com/problems/optimize-water-distribution-in-a-village/
 * Difficulty: Hard
 *
 * There are n houses in a village. We want to supply water for all the houses by building
 * wells and laying pipes.
 *
 * For each house i, we can either build a well inside it directly with cost wells[i - 1]
 * (note the -1 due to 0-indexing), or pipe in water from another well to it. The costs
 * to lay pipes between houses are given by the array pipes where each
 * pipes[j] = [house1j, house2j, costj] represents the cost to connect house1j and house2j
 * together using a pipe. Connections are bidirectional, and there could be multiple valid
 * connections between the same two houses with different costs.
 *
 * Return the minimum total cost to supply water to all houses.
 */
```

```
/**
 * @param {number} n
 * @param {number[]} wells
 * @param {number[][]} pipes
 * @return {number}
 */

```

1185 Day Of The Week

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1185. Day of the Week
 * https://leetcode.com/problems/day-of-the-week/
 * Difficulty: Easy
 *
 * Given a date, return the corresponding day of the week for that date.
 *
 * The input is given as three integers representing the day, month and year respectively.
 *
 * Return the answer as one of the following values {"Sunday", "Monday", "Tuesday",
"Wednesday",
 * "Thursday", "Friday", "Saturday"}.
 */

/**
 * @param {number} day
 * @param {number} month
 * @param {number} year
 * @return {string}
 */
var dayOfTheWeek = function(day, month, year) {
  return ['Sunday', 'Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday', 'Saturday'][
    new Date(year, month - 1, day).getDay()
  ];
};
```

1186 Maximum Subarray Sum With One Deletion

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1186. Maximum Subarray Sum with One Deletion
 * https://leetcode.com/problems/maximum-subarray-sum-with-one-deletion/
 * Difficulty: Medium
 *
 * Given an array of integers, return the maximum sum for a non-empty subarray (contiguous
elements)
 * with at most one element deletion. In other words, you want to choose a subarray and
optionally
 * delete one element from it so that there is still at least one element left and the sum of
the
 * remaining elements is maximum possible.
 *
 * Note that the subarray needs to be non-empty after deleting one element.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
var maximumSum = function(arr) {

        if (inDegree[next] === 0) queue.push(next);
      }
    }

    return order.length === size ? order : [];
  }
};
```

1206 Design Skiplist

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1206. Design Skiplist
 * https://leetcode.com/problems/design-skiplist/
 * Difficulty: Hard
 *
 * Design a Skiplist without using any built-in libraries.
 *
 * A skiplist is a data structure that takes O(log(n)) time to add, erase and search.
Comparing with
 * treap and red-black tree which has the same function and performance, the code length of
Skiplist
 * can be comparatively short and the idea behind Skiplists is just simple linked lists.
 *
 * For example, we have a Skiplist containing [30,40,50,60,70,90] and we want to add 80 and 45
 into
 * it. The Skiplist works this way:
 *
 * You can see there are many layers in the Skiplist. Each layer is a sorted linked list. With
 the
 * help of the top layers, add, erase and search can be faster than O(n). It can be proven
that the
```

```
 * average time complexity for each operation is O(log(n)) and space complexity is O(n).
 *
 * See more about Skiplist: https://en.wikipedia.org/wiki/Skip_list
 * Implement the Skiplist class:
 * - Skiplist() Initializes the object of the skiplist.
 * - bool search(int target) Returns true if the integer target exists in the Skiplist or
false
 *   otherwise.
 * - void add(int num) Inserts the value num into the SkipList.
 * - bool erase(int num) Removes the value num from the Skiplist and returns true. If num does
 not
 *   exist in the Skiplist, do nothing and return false. If there exist multiple num values,
 *   removing any one of them is fine.
 */

var Skiplist = function() {
  this.values = {};
};

/**
 * @param {number} target
 * @return {boolean}
 */
Skiplist.prototype.search = function(target) {
  return target in this.values;
};

/**
 * @param {number} num
 * @return {void}
 */
Skiplist.prototype.add = function(num) {
  this.values[num] = (this.values[num] ?? 0) + 1;
};

/**
 * @param {number} num
 * @return {boolean}
 */
Skiplist.prototype.erase = function(num) {
  if (!(num in this.values)) {
    return false;
  }
  if (!--this.values[num]) {
    delete this.values[num];
  }
  return true;
};
```

1207 Unique Number Of Occurrences

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 1207. Unique Number of Occurrences
 * https://leetcode.com/problems/unique-number-of-occurrences/
 * Difficulty: Easy
 *
 * Given an array of integers arr, return true if the number of occurrences of each
 * value in the array is unique or false otherwise.
 */

/**
 * @param {number[]} arr
 * @return {boolean}
 */
var uniqueOccurrences = function(arr) {
  const map = new Map();
  arr.forEach(n => map.set(n, map.has(n) ? map.get(n) + 1 : 1));
  const occurrences = Array.from(map.values());
```

```
  return new Set(occurrences).size === occurrences.length;
};
```

1208 Get Equal Substrings Within Budget

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1208. Get Equal Substrings Within Budget
 * https://leetcode.com/problems/get-equal-substrings-within-budget/
 * Difficulty: Medium
 *
 * You are given two strings s and t of the same length and an integer maxCost.
 *
 * You want to change s to t. Changing the ith character of s to ith character of t costs
 * |s[i] - t[i]| (i.e., the absolute difference between the ASCII values of the characters).
 *
 * Return the maximum length of a substring of s that can be changed to be the same as the
 * corresponding substring of t with a cost less than or equal to maxCost. If there is no
 * substring from s that can be changed to its corresponding substring from t, return 0.
 */

/**
 * @param {string} s
 * @param {string} t
 * @param {number} maxCost
 * @return {number}
 */
var equalSubstring = function(s, t, maxCost) {
  let left = -1;

  for (let right = 0; right < s.length; right++) {
    maxCost -= Math.abs(s.charCodeAt(right) - t.charCodeAt(right));

    if (maxCost < 0) {
      left++;
      maxCost += Math.abs(s.charCodeAt(left) - t.charCodeAt(left));
    }
  }

  return s.length - left - 1;
};
```

1209 Remove All Adjacent Duplicates In String Ii

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1209. Remove All Adjacent Duplicates in String II
 * https://leetcode.com/problems/remove-all-adjacent-duplicates-in-string-ii/
 * Difficulty: Medium
 *
 * You are given a string s and an integer k, a k duplicate removal consists of choosing k
 * adjacent and equal letters from s and removing them, causing the left and the right side
 * of the deleted substring to concatenate together.
 *
 * We repeatedly make k duplicate removals on s until we no longer can.
 *
 * Return the final string after all such duplicate removals have been made. It is guaranteed
 * that the answer is unique.
 */

/**
 * @param {string} s
 * @param {number} k
```

```
 * @return {string}
 */
var removeDuplicates = function(s, k) {
  const stack = [];

  for (const char of s) {
    if (stack.length && stack[stack.length - 1][0] === char) {
      stack[stack.length - 1][1]++;
      if (stack[stack.length - 1][1] === k) {
        stack.pop();
      }
    } else {
      stack.push([char, 1]);
    }
  }

  return stack.reduce((result, [char, count]) => result + char.repeat(count), '');
};
```

1210 Minimum Moves To Reach Target With Rotations

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1210. Minimum Moves to Reach Target with Rotations
 * https://leetcode.com/problems/minimum-moves-to-reach-target-with-rotations/
 * Difficulty: Hard
 *
 * In an n*n grid, there is a snake that spans 2 cells and starts moving from the top left
corner
 * at (0, 0) and (0, 1). The grid has empty cells represented by zeros and blocked cells
represented
 * by ones. The snake wants to reach the lower right corner at (n-1, n-2) and (n-1, n-1).
 *
 * In one move the snake can:
 * - Move one cell to the right if there are no blocked cells there. This move keeps the
 *   horizontal/vertical position of the snake as it is.
 * - Move down one cell if there are no blocked cells there. This move keeps the
horizontal/vertical
 *   position of the snake as it is.
 * - Rotate clockwise if it's in a horizontal position and the two cells under it are both
empty.
 *   In that case the snake moves from (r, c) and (r, c+1) to (r, c) and (r+1, c).
 * - Rotate counterclockwise if it's in a vertical position and the two cells to its right are
 both
 *   empty. In that case the snake moves from (r, c) and (r+1, c) to (r, c) and (r, c+1).
 *
 * Return the minimum number of moves to reach the target.
 *
 * If there is no way to reach the target, return -1.
 */

      memo[left][right] = 2 + longestPalindromeSubseq(left + 1, right - 1);
    } else {
      memo[left][right] = Math.max(
        longestPalindromeSubseq(left + 1, right),
        longestPalindromeSubseq(left, right - 1)
      );
    }

    return memo[left][right];
  }
};
```

1217 Minimum Cost To Move Chips To The Same Position

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1217. Minimum Cost to Move Chips to The Same Position
 * https://leetcode.com/problems/minimum-cost-to-move-chips-to-the-same-position/
 * Difficulty: Easy
 *
 * We have n chips, where the position of the ith chip is position[i].
 *
 * We need to move all the chips to the same position. In one step, we can change the position
 * of the ith chip from position[i] to:
 * - position[i] + 2 or position[i] - 2 with cost = 0.
 * - position[i] + 1 or position[i] - 1 with cost = 1.
 *
 * Return the minimum cost needed to move all the chips to the same position.
 */
```

```
/**
 * @param {number[]} position
 * @return {number}
 */
var minCostToMoveChips = function(position) {
  const count = position.reduce((result, n) => n % 2 ? ++result : result, 0);
  return count >= position.length / 2 ? position.length - count : count;
};
```

1218 Longest Arithmetic Subsequence Of Given Difference

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1218. Longest Arithmetic Subsequence of Given Difference
 * https://leetcode.com/problems/longest-arithmetic-subsequence-of-given-difference/
 * Difficulty: Medium
 *
 * Given an integer array arr and an integer difference, return the length of the longest
 * subsequence in arr which is an arithmetic sequence such that the difference between
adjacent
 * elements in the subsequence equals difference.
 *
 * A subsequence is a sequence that can be derived from arr by deleting some or no elements
without
 * changing the order of the remaining elements.
 */

/**
 * @param {number[]} arr
 * @param {number} difference
 * @return {number}
 */

};
```

1223 Dice Roll Simulation

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1223. Dice Roll Simulation
 * https://leetcode.com/problems/dice-roll-simulation/
 * Difficulty: Hard
 *
 * A die simulator generates a random number from 1 to 6 for each roll. You introduced a
constraint
 * to the generator such that it cannot roll the number i more than rollMax[i] (1-indexed)
 * consecutive times.
 *
 * Given an array of integers rollMax and an integer n, return the number of distinct
sequences
 * that can be obtained with exact n rolls. Since the answer may be too large, return it
modulo
 * 1e9 + 7.
 *
 * Two sequences are considered different if at least one element differs from each other.
 */

/**
 * @param {number} n
```

```
 * @param {number[]} rollMax
 * @return {number}
 */
var dieSimulator = function(n, rollMax) {
  const MOD = 1e9 + 7;
  const faces = 6;

  const dp = new Array(n + 1).fill().map(() => new Array(faces).fill(0));
  for (let face = 0; face < faces; face++) {
    dp[1][face] = 1;
  }

  for (let rolls = 2; rolls <= n; rolls++) {
    for (let face = 0; face < faces; face++) {

  let result = s.length;
  let left = 0;

  for (let right = 0; right < s.length; right++) {
    charCount[s[right]]--;

    while (left <= right && Object.values(charCount).every(count => count <= target)) {
      result = Math.min(result, right - left + 1);
      charCount[s[left]]++;
      left++;
    }
  }

  return result;
};
```

1235 Maximum Profit In Job Scheduling

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1235. Maximum Profit in Job Scheduling
 * https://leetcode.com/problems/maximum-profit-in-job-scheduling/
 * Difficulty: Hard
 *
 * We have n jobs, where every job is scheduled to be done from startTime[i] to endTime[i],
 * obtaining a profit of profit[i].
 *
 * You're given the startTime, endTime and profit arrays, return the maximum profit you can
 * take such that there are no two jobs in the subset with overlapping time range.
 *
 * If you choose a job that ends at time X you will be able to start another job that starts
 * at time X.
 */

/**
 * @param {number[]} startTime
 * @param {number[]} endTime
 * @param {number[]} profit
 * @return {number}
 */
var jobScheduling = function(startTime, endTime, profit) {
  const jobCount = startTime.length;
  const indices = Array.from({ length: jobCount }, (_, i) => i)
    .sort((a, b) => startTime[a] - startTime[b]);

  const maxProfit = new Array(jobCount + 1).fill(0);

  for (let i = jobCount - 1; i >= 0; i--) {
    let left = i + 1;
    let right = jobCount - 1;
    const currentEnd = endTime[indices[i]];

    while (left <= right) {
      const mid = left + right >> 1;
      if (startTime[indices[mid]] < currentEnd) left = mid + 1;
      else right = mid - 1;
    }

    maxProfit[i] = Math.max(maxProfit[i + 1], profit[indices[i]] + maxProfit[left]);
  }

  return maxProfit[0];
};
```

1236 Web Crawler

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1236. Web Crawler
 * https://leetcode.com/problems/web-crawler/
 * Difficulty: Medium
 *
 * Given a url startUrl and an interface HtmlParser, implement a web crawler to crawl all
 * links that are under the same hostname as startUrl.
 *
 * Return all urls obtained by your web crawler in any order.
 *
 * Your crawler should:
 * - Start from the page: startUrl
 * - Call HtmlParser.getUrls(url) to get all urls from a webpage of given url.
 * - Do not crawl the same link twice.
 * - Explore only the links that are under the same hostname as startUrl.
 *
 * As shown in the example url above, the hostname is example.org. For simplicity sake, you
may
 * assume all urls use http protocol without any port specified. For example, the urls
 * http://leetcode.com/problems and http://leetcode.com/contest are under the same hostname,
 * while urls http://example.org/test and http://example.com/abc are not under the same
hostname.
 *
 * The HtmlParser interface is defined as such:
 * interface HtmlParser {
 *   // Return a list of all urls from a webpage of given url.
 *   public List<String> getUrls(String url);
 * }
 *
 * Below are two examples explaining the functionality of the problem, for custom testing
purposes
 * you'll have three variables urls, edges and startUrl. Notice that you will only have access
 to
 * startUrl in your code, while urls and edges are not directly accessible to you in code.
 *
 * Note: Consider the same URL with the trailing slash "/" as a different URL. For example,
 * "http://news.yahoo.com", and "http://news.yahoo.com/" are different urls.
 */

/**
 * @param {string} startUrl
 * @param {HtmlParser} htmlParser
 * @return {string[]}
*/
var crawl = function(startUrl, htmlParser) {
  const targetHostname = getHostname(startUrl);
  const visited = new Set();
  const queue = [startUrl];
  const result = [];

  while (queue.length > 0) {
    const currentUrl = queue.shift();

    if (visited.has(currentUrl)) continue;

    visited.add(currentUrl);
    result.push(currentUrl);

    const urls = htmlParser.getUrls(currentUrl);

    for (const url of urls) {
      if (!visited.has(url) && getHostname(url) === targetHostname) {
        queue.push(url);
      }
    }
```

```
  }

  return result;

  function getHostname(url) {
    return url.split('/')[2];
  }
};
```

1237 Find Positive Integer Solution For A Given Equation

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**

```

1243 Array Transformation

EASY

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1243. Array Transformation
 * https://leetcode.com/problems/array-transformation/
 * Difficulty: Easy
 *
 * Given an initial array arr, every day you produce a new array using the array of the
 * previous day.
 *
 * On the i-th day, you do the following operations on the array of day i-1 to produce
 * the array of day i:
 * - If an element is smaller than both its left neighbor and its right neighbor, then this
 *   element is incremented.
 * - If an element is bigger than both its left neighbor and its right neighbor, then this
 *   element is decremented.
 *
 * The first and last elements never change.
 *
 * After some days, the array does not change. Return that final array.
 */

/**
 * @param {number[]} arr
 * @return {number[]}
 */
var transformArray = function(arr) {
  let current = [...arr];

  while (true) {
    const next = [...current];
    let changed = false;

    for (let i = 1; i < current.length - 1; i++) {
      if (current[i] < current[i - 1] && current[i] < current[i + 1]) {
        next[i]++;
        changed = true;
      } else if (current[i] > current[i - 1] && current[i] > current[i + 1]) {
        next[i]--;
        changed = true;
      }
    }

    if (!changed) break;
    current = next;
  }

  return current;
};
```

1244 Design A Leaderboard

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1244. Design A Leaderboard
 * https://leetcode.com/problems/design-a-leaderboard/
 * Difficulty: Medium
 *
 * Design a Leaderboard class, which has 3 functions:
 * - addScore(playerId, score): Update the leaderboard by adding score to the given player's
 *   score. If there is no player with such id in the leaderboard, add him to the leaderboard
 *   with the given score.
 * - top(K): Return the score sum of the top K players.
 * - reset(playerId): Reset the score of the player with the given id to 0 (in other words
 *   erase it from the leaderboard). It is guaranteed that the player was added to the
leaderboard
 *   before calling this function.
 *
 * Initially, the leaderboard is empty.
 */

var Leaderboard = function() {
  this.scores = new Map();
};

/**
 * @param {number} playerId
 * @param {number} score
 * @return {void}
 */
Leaderboard.prototype.addScore = function(playerId, score) {
  this.scores.set(playerId, (this.scores.get(playerId) || 0) + score);
};

/**
 * @param {number} K
 * @return {number}
 */
Leaderboard.prototype.top = function(K) {
  const sortedScores = Array.from(this.scores.values()).sort((a, b) => b - a);
  return sortedScores.slice(0, K).reduce((sum, score) => sum + score, 0);
};

/**
 * @param {number} playerId
 * @return {void}
 */
Leaderboard.prototype.reset = function(playerId) {
  this.scores.delete(playerId);
};
```

1245 Tree Diameter

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1245. Tree Diameter
 * https://leetcode.com/problems/tree-diameter/
 * Difficulty: Medium
 *
 * The diameter of a tree is the number of edges in the longest path in that tree.
 *
 * There is an undirected tree of n nodes labeled from 0 to n - 1. You are given a 2D array
```

```
 * edges where edges.length == n - 1 and edges[i] = [ai, bi] indicates that there is an
 * undirected edge between nodes ai and bi in the tree.
 *
 * Return the diameter of the tree.
 */

1259 Handshakes That Dont Cross

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1259. Handshakes That Don't Cross
 * https://leetcode.com/problems/handshakes-that-dont-cross/
 * Difficulty: Hard
 *
 * You are given an even number of people numPeople that stand around a circle and each
 * person shakes hands with someone else so that there are numPeople / 2 handshakes total.
 *
 * Return the number of ways these handshakes could occur such that none of the handshakes
cross.
 *
 * Since the answer could be very large, return it modulo 109 + 7.
 */

/**
 * @param {number} numPeople
 * @return {number}
 */
var numberOfWays = function(numPeople) {
  const MOD = 1e9 + 7;
  const n = numPeople / 2;
  const dp = new Array(n + 1).fill(0n);
  dp[0] = 1n;

  for (let i = 1; i <= n; i++) {
    for (let j = 0; j < i; j++) {
      dp[i] = (dp[i] + dp[j] * dp[i - 1 - j]) % BigInt(MOD);
    }
  }

  return Number(dp[n]);
};
```

1260 Shift 2D Grid

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1260. Shift 2D Grid
 * https://leetcode.com/problems/shift-2d-grid/
 * Difficulty: Easy
 *
 * Given a 2D grid of size m x n and an integer k. You need to shift the grid k times.
 *
 * In one shift operation:
 * - Element at grid[i][j] moves to grid[i][j + 1].
 * - Element at grid[i][n - 1] moves to grid[i + 1][0].
 * - Element at grid[m - 1][n - 1] moves to grid[0][0].
 *
 * Return the 2D grid after applying shift operation k times.
 */

/**
 * @param {number[][]} grid
 * @param {number} k
 * @return {number[][]}
 */
var shiftGrid = function(grid, k) {
  const rows = grid.length;
  const cols = grid[0].length;
  const total = rows * cols;

  if (k === 0 || k % total === 0) return grid;

  const effectiveShifts = k % total;
  const flat = grid.flat();
  const shifted = [...flat.slice(-effectiveShifts), ...flat.slice(0, -effectiveShifts)];
  const result = [];
  for (let i = 0; i < rows; i++) {
    result.push(shifted.slice(i * cols, (i + 1) * cols));
  }

  return result;
};
```

1261 Find Elements In A Contaminated Binary Tree

MEDIUM

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 1261. Find Elements in a Contaminated Binary Tree
 * https://leetcode.com/problems/find-elements-in-a-contaminated-binary-tree/
 * Difficulty: Medium
 *
 * Given a binary tree with the following rules:
 * 1. root.val == 0
 * 2. For any treeNode:
 *   1. If treeNode.val has a value x and treeNode.left != null,
 *      then treeNode.left.val == 2 * x + 1
 *   2. If treeNode.val has a value x and treeNode.right != null,
 *      then treeNode.right.val == 2 * x + 2
 *
 * Now the binary tree is contaminated, which means all treeNode.val have
 * been changed to -1.
 *
 * Implement the FindElements class:
 * - FindElements(TreeNode* root) Initializes the object with a contaminated binary
 *   tree and recovers it.
```

```
 * - bool find(int target) Returns true if the target value exists in the recovered
 *   binary tree.
 */

/**
 * Definition for a binary tree node.
 * function TreeNode(val, left, right) {
 *     this.val = (val===undefined ? 0 : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {TreeNode} root
 */

    for (let remainder = 0; remainder < 3; remainder++) {
      dp[(remainder + num) % 3] = Math.max(dp[(remainder + num) % 3], prev[remainder] + num);
    }
  }

  return dp[0];
};
```

1263 Minimum Moves To Move A Box To Their Target Location

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1263. Minimum Moves to Move a Box to Their Target Location
 * https://leetcode.com/problems/minimum-moves-to-move-a-box-to-their-target-location/
 * Difficulty: Hard
 *
 * A storekeeper is a game in which the player pushes boxes around in a warehouse trying to
get
 * them to target locations.
 *
 * The game is represented by an m x n grid of characters grid where each element is a wall,
floor,
 * or box.
 *
 * Your task is to move the box 'B' to the target position 'T' under the following rules:
 * - The character 'S' represents the player. The player can move up, down, left, right in
grid if
 *   it is a floor (empty cell).
 * - The character '.' represents the floor which means a free cell to walk.
 * - The character '#' represents the wall which means an obstacle (impossible to walk there).
 * - There is only one box 'B' and one target cell 'T' in the grid.
 * - The box can be moved to an adjacent free cell by standing next to the box and then moving
 in
 *   the direction of the box. This is a push.
 * - The player cannot walk through the box.
 *
 * Return the minimum number of pushes to move the box to the target. If there is no way to
reach
 * the target, return -1.
 */

  }

  return -1;
};
```

1265 Print Immutable Linked List In Reverse

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1265. Print Immutable Linked List in Reverse
 * https://leetcode.com/problems/print-immutable-linked-list-in-reverse/
 * Difficulty: Medium
 *
 * You are given an immutable linked list, print out all values of each node in reverse
 * with the help of the following interface:
 * - ImmutableListNode: An interface of immutable linked list, you are given the head of the
list.
 *
 * You need to use the following functions to access the linked list (you can't access the
 * ImmutableListNode directly):
 * - ImmutableListNode.printValue(): Print value of the current node.
 * - ImmutableListNode.getNext(): Return the next node.
 *
 * The input is only given to initialize the linked list internally. You must solve this
problem
 * without modifying the linked list. In other words, you must operate the linked list using
 * only the mentioned APIs.
 */

/**
 * @param {ImmutableListNode} head
 * @return {void}
 */
var printLinkedListInReverse = function(head) {
  if (!head) return;
  printLinkedListInReverse(head.getNext());
  head.printValue();
};
```

1266 Minimum Time Visiting All Points

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1266. Minimum Time Visiting All Points
 * https://leetcode.com/problems/minimum-time-visiting-all-points/
 * Difficulty: Easy
 *
 * On a 2D plane, there are n points with integer coordinates points[i] = [xi, yi]. Return the
 * minimum time in seconds to visit all the points in the order given by points.
 *
 * You can move according to these rules:
 * - In 1 second, you can either:
 *   - move vertically by one unit,
 *   - move horizontally by one unit, or
 *   - move diagonally sqrt(2) units (in other words, move one unit vertically then one unit
 *     horizontally in 1 second).
 * - You have to visit the points in the same order as they appear in the array.
 * - You are allowed to pass through points that appear later in the order, but these do not
 *   count as visits.
 */

/**
 * @param {number[][]} points
 * @return {number}
 */
var minTimeToVisitAllPoints = function(points) {
  return points.reduce((steps, point, i) => steps + (!points[i + 1] ? 0 : Math.max(
    Math.abs(point[0] - points[i + 1][0]), Math.abs(point[1] - points[i + 1][1])
  )), 0);
};
```

1267 Count Servers That Communicate

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1267. Count Servers that Communicate
 * https://leetcode.com/problems/count-servers-that-communicate/
 * Difficulty: Medium
 *
 * You are given a map of a server center, represented as a m * n integer matrix grid,
 * where 1 means that on that cell there is a server and 0 means that it is no server.
 * Two servers are said to communicate if they are on the same row or on the same column.
 *
 * Return the number of servers that communicate with any other server.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var countServers = function(grid) {
  const rows = new Array(grid.length).fill(0);
  const columns = new Array(grid[0].length).fill(0);

  for (let i = 0; i < grid.length; i++) {
    for (let j = 0; j < grid[i].length; j++) {
      if (grid[i][j]) {
        rows[i]++;
        columns[j]++;
      }
    }
  }
```

```

        continue;
      }
      result++;
    }
  }

  return result;
};
```

1268 Search Suggestions System

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1268. Search Suggestions System
 * https://leetcode.com/problems/search-suggestions-system/
 * Difficulty: Medium
 *
 * You are given an array of strings products and a string searchWord.
 *
 * Design a system that suggests at most three product names from products after each
 * character of searchWord is typed. Suggested products should have common prefix with
 * searchWord. If there are more than three products with a common prefix return the
 * three lexicographically minimums products.
 *
 * Return a list of lists of the suggested products after each character of searchWord
 * is typed.
 */

/**
 * @param {string[]} products
 * @param {string} searchWord
 * @return {string[][]}
 */
var suggestedProducts = function(products, searchWord) {
  products.sort();
  const result = new Array(searchWord.length);
  for (let i = 0; i < searchWord.length; i++) {
    products = products.filter((word) => word[i] === searchWord[i]);
    result[i] = products.slice(0, 3);
  }
  return result;
};
```

1269 Number Of Ways To Stay In The Same Place After Some Steps

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1269. Number of Ways to Stay in the Same Place After Some Steps
 * https://leetcode.com/problems/number-of-ways-to-stay-in-the-same-place-after-some-steps/
 * Difficulty: Hard
 *
 * You have a pointer at index 0 in an array of size arrLen. At each step, you can move 1
position
 * to the left, 1 position to the right in the array, or stay in the same place (The pointer
should
 * not be placed outside the array at any time).
 *
 * Given two integers steps and arrLen, return the number of ways such that your pointer is
```

```
still
 * at index 0 after exactly steps steps. Since the answer may be too large, return it modulo
 * 109 + 7.
 */

/**
 * @param {number} steps
 * @param {number} arrLen
 * @return {number}
 */

  const midY = Math.floor((y1 + y2) / 2);

  return countShips(sea, [midX, midY], [x1, y1])
    + countShips(sea, [x2, midY], [midX + 1, y1])
    + countShips(sea, [midX, y2], [x1, midY + 1])
    + countShips(sea, [x2, y2], [midX + 1, midY + 1]);
};
```

1275 Find Winner On A Tic Tac Toe Game

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1275. Find Winner on a Tic Tac Toe Game
 * https://leetcode.com/problems/find-winner-on-a-tic-tac-toe-game/
 * Difficulty: Easy
 *
 * Tic-tac-toe is played by two players A and B on a 3 x 3 grid. The rules of Tic-Tac-Toe are:
 * - Players take turns placing characters into empty squares ' '.
 * - The first player A always places 'X' characters, while the second player B always places
 *   'O' characters.
 * - 'X' and 'O' characters are always placed into empty squares, never on filled ones.
 * - The game ends when there are three of the same (non-empty) character filling any row,
 *   column, or diagonal.
 * - The game also ends if all squares are non-empty.
 * - No more moves can be played if the game is over.
 *
 * Given a 2D integer array moves where moves[i] = [rowi, coli] indicates that the ith move
 * will be played on grid[rowi][coli]. return the winner of the game if it exists (A or B).
 * In case the game ends in a draw return "Draw". If there are still movements to play return
 * "Pending".
 *
 * You can assume that moves is valid (i.e., it follows the rules of Tic-Tac-Toe), the grid is
 * initially empty, and A will play first.
 */

/**
 * @param {number[][]} moves
 * @return {string}
 */

1319 Number Of Operations To Make Network Connected

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1319. Number of Operations to Make Network Connected
 * https://leetcode.com/problems/number-of-operations-to-make-network-connected/
 * Difficulty: Medium
 *
 * There are n computers numbered from 0 to n - 1 connected by ethernet cables connections
forming
 * a network where connections[i] = [ai, bi] represents a connection between computers ai and
bi.
 * Any computer can reach any other computer directly or indirectly through the network.
 *
 * You are given an initial computer network connections. You can extract certain cables
```

```
between
 * two directly connected computers, and place them between any pair of disconnected computers
 to
 * make them directly connected.
 *
 * Return the minimum number of times you need to do this in order to make all the computers
 * connected. If it is not possible, return -1.
 */

/**
 * @param {number} n
 * @param {number[][]} connections
 * @return {number}
 */

```

1320 Minimum Distance To Type A Word Using Two Fingers

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1320. Minimum Distance to Type a Word Using Two Fingers
 * https://leetcode.com/problems/minimum-distance-to-type-a-word-using-two-fingers/
 * Difficulty: Hard
 *
 * You have a keyboard layout as shown above in the X-Y plane, where each English uppercase
letter
 * is located at some coordinate.
 *
 * For example, the letter 'A' is located at coordinate (0, 0), the letter 'B' is located at
 * coordinate (0, 1), the letter 'P' is located at coordinate (2, 3) and the letter 'Z' is
located
 * at coordinate (4, 1).
 *
 * Given the string word, return the minimum total distance to type such string using only two
 * fingers.
 *
 * The distance between coordinates (x1, y1) and (x2, y2) is |x1 - x2| + |y1 - y2|.
 *
 * Note that the initial positions of your two fingers are considered free so do not count
towards
 * your total distance, also your two fingers do not have to start at the first letter or the
first
```

```
 * two letters.
 */

/**
 * @param {string} word
 * @return {number}
 */

};
```

1333 Filter Restaurants By Vegan Friendly Price And Distance

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1333. Filter Restaurants by Vegan-Friendly, Price and Distance
 * https://leetcode.com/problems/filter-restaurants-by-vegan-friendly-price-and-distance/
 * Difficulty: Medium
 *
 * Given the array restaurants where  restaurants[i] = [idi, ratingi, veganFriendlyi, pricei,
distancei].
 * You have to filter the restaurants using three filters.
 *
 * The veganFriendly filter will be either true (meaning you should only include restaurants
with
 * veganFriendlyi set to true) or false (meaning you can include any restaurant). In addition,
 you
 * have the filters maxPrice and maxDistance which are the maximum value for price and
distance of
 * restaurants you should consider respectively.
 *
 * Return the array of restaurant IDs after filtering, ordered by rating from highest to
lowest.
 * For restaurants with the same rating, order them by id from highest to lowest. For
simplicity
 * veganFriendlyi and veganFriendly take value 1 when it is true, and 0 when it is false.
 */

/**
 * @param {number[][]} restaurants
 * @param {number} veganFriendly
 * @param {number} maxPrice
 * @param {number} maxDistance
 * @return {number[]}
 */
var filterRestaurants = function(restaurants, veganFriendly, maxPrice, maxDistance) {
  return restaurants.filter(([,, v, p, d]) => v >= veganFriendly && p <= maxPrice && d <=
maxDistance)
    .sort((a, b) => a[1] === b[1] ? b[0] - a[0] : b[1] - a[1])
    .map(r => r[0]);
};
```

1334 Find The City With The Smallest Number Of Neighbors At A Threshold

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

    charCount[t.charCodeAt(i) - 97]--;
  }

  for (const count of charCount) {
    if (count > 0) result += count;
  }

  return result;
};
```

1348 Tweet Counts Per Frequency

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1348. Tweet Counts Per Frequency
 * https://leetcode.com/problems/tweet-counts-per-frequency/
 * Difficulty: Medium
 *
```

```
 * A social media company is trying to monitor activity on their site by analyzing the number
 * of tweets that occur in select periods of time. These periods can be partitioned into
 * smaller time chunks based on a certain frequency (every minute, hour, or day).
 *
 * For example, the period [10, 10000] (in seconds) would be partitioned into the following
 * time chunks with these frequencies:
 * - Every minute (60-second chunks): [10,69], [70,129], [130,189], ..., [9970,10000]
 * - Every hour (3600-second chunks): [10,3609], [3610,7209], [7210,10000]
 * - Every day (86400-second chunks): [10,10000]
 *
 * Notice that the last chunk may be shorter than the specified frequency's chunk size and
will
 * always end with the end time of the period (10000 in the above example).
 *
 * Design and implement an API to help the company with their analysis.
 *
 * Implement the TweetCounts class:
 * - TweetCounts() Initializes the TweetCounts object.
 * - void recordTweet(String tweetName, int time) Stores the tweetName at the recorded time
 *   (in seconds).
 * - List<Integer> getTweetCountsPerFrequency(String freq, String tweetName, int startTime,
 *   int endTime) Returns a list of integers representing the number of tweets with tweetName
 *   in each time chunk for the given period of time [startTime, endTime] (in seconds) and
 *   frequency freq.
 * - freq is one of "minute", "hour", or "day" representing a frequency of every minute, hour,
 *   or day respectively.
 */

var TweetCounts = function() {
  this.tweets = new Map();

```

1357 Apply Discount Every N Orders

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1357. Apply Discount Every n Orders
 * https://leetcode.com/problems/apply-discount-every-n-orders/
 * Difficulty: Medium
 *
 * There is a supermarket that is frequented by many customers. The products sold at the
supermarket
 * are represented as two parallel integer arrays products and prices, where the ith product
has an
 * ID of products[i] and a price of prices[i].
 *
 * When a customer is paying, their bill is represented as two parallel integer arrays product
 and
 * amount, where the jth product they purchased has an ID of product[j], and amount[j] is how
much
 * of the product they bought. Their subtotal is calculated as the sum of each amount[j] *
(price
 * of the jth product).
 *
 * The supermarket decided to have a sale. Every nth customer paying for their groceries will
be
 * given a percentage discount. The discount amount is given by discount, where they will be
given
 * discount percent off their subtotal. More formally, if their subtotal is bill, then they
would
 * actually pay bill * ((100 - discount) / 100).
 *
 * Implement the Cashier class:
 * - Cashier(int n, int discount, int[] products, int[] prices) Initializes the object with n,
 *   the discount, and the products and their prices.
 * - double getBill(int[] product, int[] amount) Returns the final total of the bill with the
 *   discount applied (if any). Answers within 10-5 of the actual value will be accepted.
```

```
 */

/**
 * @param {number} n
 * @param {number} discount
 * @param {number[]} products
 * @param {number[]} prices
 */

  }
};
```

1368 Minimum Cost To Make At Least One Valid Path In A Grid

HARD

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1368. Minimum Cost to Make at Least One Valid Path in a Grid
 * https://leetcode.com/problems/minimum-cost-to-make-at-least-one-valid-path-in-a-grid/
 * Difficulty: Hard
 *
 * Given an m x n grid. Each cell of the grid has a sign pointing to the next cell you should
 * visit if you are currently in this cell. The sign of grid[i][j] can be:
 * - 1 which means go to the cell to the right. (i.e go from grid[i][j] to grid[i][j + 1])
 * - 2 which means go to the cell to the left. (i.e go from grid[i][j] to grid[i][j - 1])
 * - 3 which means go to the lower cell. (i.e go from grid[i][j] to grid[i + 1][j])
 * - 4 which means go to the upper cell. (i.e go from grid[i][j] to grid[i - 1][j])
 *
 * Notice that there could be some signs on the cells of the grid that point outside the grid.
 *
 * You will initially start at the upper left cell (0, 0). A valid path in the grid is a path
 * that starts from the upper left cell (0, 0) and ends at the bottom-right cell (m - 1, n -
1)
 * following the signs on the grid. The valid path does not have to be the shortest.
 *
 * You can modify the sign on a cell with cost = 1. You can modify the sign on a cell one time
 * only.
 *
 * Return the minimum cost to make the grid have at least one valid path.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var minCost = function(grid) {
  const queue = [[0, 0]];
  const directions = [[0, 1, 1], [0, -1, 2], [1, 0, 3], [-1, 0, 4]];

1377 Frog Position After T Seconds

HARD

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1377. Frog Position After T Seconds
 * https://leetcode.com/problems/frog-position-after-t-seconds/
 * Difficulty: Hard
 *
 * Given an undirected tree consisting of n vertices numbered from 1 to n. A frog starts
 * jumping from vertex 1. In one second, the frog jumps from its current vertex to another
 * unvisited vertex if they are directly connected. The frog can not jump back to a visited
 * vertex. In case the frog can jump to several vertices, it jumps randomly to one of them
 * with the same probability. Otherwise, when the frog can not jump to any unvisited vertex,
 * it jumps forever on the same vertex.
 *
 * The edges of the undirected tree are given in the array edges, where edges[i] = [ai, bi]
 * means that exists an edge connecting the vertices ai and bi.
 *
 * Return the probability that after t seconds the frog is on the vertex target. Answers
 * within 10-5 of the actual answer will be accepted.
 */

```

1387 Sort Integers By The Power Value

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1387. Sort Integers by The Power Value
 * https://leetcode.com/problems/sort-integers-by-the-power-value/
 * Difficulty: Medium
 *
 * The power of an integer x is defined as the number of steps needed to transform x into
 * 1 using the following steps:
 * - if x is even then x = x / 2
 * - if x is odd then x = 3 * x + 1
 *
 * For example, the power of x = 3 is 7 because 3 needs 7 steps to become 1
 * (3 --> 10 --> 5 --> 16 --> 8 --> 4 --> 2 --> 1).
 *
 * Given three integers lo, hi and k. The task is to sort all integers in the interval
 * [lo, hi] by the power value in ascending order, if two or more integers have the same
 * power value sort them by ascending order.
 *
 * Return the kth integer in the range [lo, hi] sorted by the power value.
 *
 * Notice that for any integer x (lo <= x <= hi) it is guaranteed that x will transform
 * into 1 using these steps and that the power of x is will fit in a 32-bit signed integer.
 */

1394 Find Lucky Integer In An Array

EASY

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1394. Find Lucky Integer in an Array
 * https://leetcode.com/problems/find-lucky-integer-in-an-array/
 * Difficulty: Easy
 *
 * Given an array of integers arr, a lucky integer is an integer that has a frequency
 * in the array equal to its value.
 *
 * Return the largest lucky integer in the array. If there is no lucky integer return -1.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
```

```
var findLucky = function(arr) {
  const frequencyMap = new Map();
  let result = -1;

  for (const num of arr) {
    frequencyMap.set(num, (frequencyMap.get(num) || 0) + 1);
  }
  for (const [num, count] of frequencyMap) {
    if (num === count && num > result) {
      result = num;
    }
  }

  return result;
};
```

1395 Count Number Of Teams

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1395. Count Number of Teams
 * https://leetcode.com/problems/count-number-of-teams/
 * Difficulty: Medium
 *
 * There are n soldiers standing in a line. Each soldier is assigned a unique rating value.
 *
 * You have to form a team of 3 soldiers amongst them under the following rules:
 * - Choose 3 soldiers with index (i, j, k) with rating (rating[i], rating[j], rating[k]).
 * - A team is valid if: (rating[i] < rating[j] < rating[k]) or (rating[i] > rating[j] >
rating[k])
 *   where (0 <= i < j < k < n).
 *
 * Return the number of teams you can form given the conditions. (soldiers can be part of
 * multiple teams).
 */

/**
 * @param {number[]} rating
 * @return {number}
 */
var numTeams = function(rating) {
  let result = 0;

};
```

1396 Design Underground System

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups.

SOURCE CODE

```
/**
 * 1396. Design Underground System
 * https://leetcode.com/problems/design-underground-system/
 * Difficulty: Medium
 *
 * An underground railway system is keeping track of customer travel times between different
 * stations. They are using this data to calculate the average time it takes to travel from
 * one station to another.
 *
 * Implement the UndergroundSystem class:
 * - void checkIn(int id, string stationName, int t)
 *   - A customer with a card ID equal to id, checks in at the station stationName at time t.
 *   - A customer can only be checked into one place at a time.
 * - void checkOut(int id, string stationName, int t)
 *   - A customer with a card ID equal to id, checks out from the station stationName at time
t.
 * - double getAverageTime(string startStation, string endStation)
 *   - Returns the average time it takes to travel from startStation to endStation.
 *   - The average time is computed from all the previous traveling times from startStation to
 *     endStation that happened directly, meaning a check in at startStation followed by a
check
 *     out from endStation.
 *   - The time it takes to travel from startStation to endStation may be different from the
 *     time it takes to travel from endStation to startStation.
 *
 * There will be at least one customer that has traveled from startStation to endStation
before
 * getAverageTime is called.
 * You may assume all calls to the checkIn and checkOut methods are consistent. If a customer
 * checks in at time t1 then checks out at time t2, then t1 < t2. All events happen in
 * chronological order.
 */

var UndergroundSystem = function() {
  this.travels = new Map();
  this.averages = new Map();
};

  }
```

```
  return Number((pattern121 + pattern123) % MOD);
};
```

1413 Minimum Value To Get Positive Step By Step Sum

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1413. Minimum Value to Get Positive Step by Step Sum
 * https://leetcode.com/problems/minimum-value-to-get-positive-step-by-step-sum/
 * Difficulty: Easy
 *
 * Given an array of integers nums, you start with an initial positive value startValue.
 *
 * In each iteration, you calculate the step by step sum of startValue plus elements in
 * nums (from left to right).
 *
 * Return the minimum positive value of startValue such that the step by step sum is never
 * less than 1.
 */

/**
 * @param {number[]} nums
 * @return {number}
 */
var minStartValue = function(nums) {
  let minSum = 0;
  let currentSum = 0;

  for (const num of nums) {
    currentSum += num;
    minSum = Math.min(minSum, currentSum);
  }

  return Math.max(1, 1 - minSum);
};
```

1414 Find The Minimum Number Of Fibonacci Numbers Whose Sum Is K

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1414. Find the Minimum Number of Fibonacci Numbers Whose Sum Is K
 * https://leetcode.com/problems/find-the-minimum-number-of-fibonacci-numbers-whose-sum-is-k/
 * Difficulty: Medium
 *
 * Given an integer k, return the minimum number of Fibonacci numbers whose sum is equal to k.
 * The same Fibonacci number can be used multiple times.
 *
 * The Fibonacci numbers are defined as:
 * - F1 = 1
 * - F2 = 1
 * - Fn = Fn-1 + Fn-2 for n > 2.
 *
 * It is guaranteed that for the given constraints we can always find such Fibonacci numbers
 * that sum up to k.
 */

/**
 * @param {number} k
 * @return {number}
 */
var findMinFibonacciNumbers = function(k) {
  const fibonacci = [1, 1];
  while (fibonacci[fibonacci.length - 1] <= k) {
```

```
    fibonacci.push(fibonacci[fibonacci.length - 1] + fibonacci[fibonacci.length - 2]);
  }

  let count = 0;
  let remaining = k;

  for (let i = fibonacci.length - 1; i >= 0 && remaining > 0; i--) {
    while (fibonacci[i] <= remaining) {
      remaining -= fibonacci[i];
      count++;
    }
  }

  return count;
};
```

1415 The K Th Lexicographical String Of All Happy Strings Of Length N

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1415. The k-th Lexicographical String of All Happy Strings of Length n
 * https://leetcode.com/problems/the-k-th-lexicographical-string-of-all-happy-strings-of-lengt
h-n/
 * Difficulty: Medium
 *
 * A happy string is a string that:
 * - consists only of letters of the set ['a', 'b', 'c'].
 * - s[i] != s[i + 1] for all values of i from 1 to s.length - 1 (string is 1-indexed).
 *
 * For example, strings "abc", "ac", "b" and "abcbabcbcb" are all happy strings and strings
"aa",
 * "baa" and "ababbc" are not happy strings.
 *
 * Given two integers n and k, consider a list of all happy strings of length n sorted in
 * lexicographical order.
 *
 * Return the kth string of this list or return an empty string if there are less than k happy
 * strings of length n.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {string}
 */
var getHappyString = function(n, k) {

    }

    deque.push(i);
    result = Math.max(result, maxSums[i]);
  }

  return result;
};
```

1426 Counting Elements

EASY

APPROACH NOTES

Uses a Set for unique membership.

SOURCE CODE

```
/**
 * 1426. Counting Elements
 * https://leetcode.com/problems/counting-elements/
 * Difficulty: Easy
 *
 * Given an integer array arr, count how many elements x there are, such that x + 1 is also
 * in arr. If there are duplicates in arr, count them separately.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
var countElements = function(arr) {
  const set = new Set(arr);
  return arr.filter(num => set.has(num + 1)).length;
};
```

1427 Perform String Shifts

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1427. Perform String Shifts
 * https://leetcode.com/problems/perform-string-shifts/
```

```
 * Difficulty: Easy
 *
 * You are given a string s containing lowercase English letters, and a matrix shift,
 * where shift[i] = [directioni, amounti]:
 * - directioni can be 0 (for left shift) or 1 (for right shift).
 * - amounti is the amount by which string s is to be shifted.
 * - A left shift by 1 means remove the first character of s and append it to the end.
 * - Similarly, a right shift by 1 means remove the last character of s and add it to the
beginning.
 *
 * Return the final string after all operations.
 */

/**
 * @param {string} s
 * @param {number[][]} shift
 * @return {string}
 */
var stringShift = function(s, shift) {
  let netShift = 0;

  for (const [direction, amount] of shift) {
    netShift += direction === 0 ? -amount : amount;
  }

  const n = s.length;
  netShift = ((netShift % n) + n) % n;

  return s.slice(-netShift) + s.slice(0, -netShift);
};
```

1428 Leftmost Column With At Least A One

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1428. Leftmost Column with at Least a One
 * https://leetcode.com/problems/leftmost-column-with-at-least-a-one/
 * Difficulty: Medium
 *
 * A row-sorted binary matrix means that all elements are 0 or 1 and each row of the matrix
 * is sorted in non-decreasing order.
 *
 * Given a row-sorted binary matrix binaryMatrix, return the index (0-indexed) of the leftmost
 * column with a 1 in it. If such an index does not exist, return -1.
 *
 * You can't access the Binary Matrix directly. You may only access the matrix using a
 * BinaryMatrix interface:
 * - BinaryMatrix.get(row, col) returns the element of the matrix at index (row, col)
(0-indexed).
 * - BinaryMatrix.dimensions() returns the dimensions of the matrix as a list of 2
 *   elements [rows, cols], which means the matrix is rows x cols.
 *
 * Submissions making more than 1000 calls to BinaryMatrix.get will be judged Wrong Answer.
 * Also, any solutions that attempt to circumvent the judge will result in disqualification.
 *
 * For custom testing purposes, the input will be the entire binary matrix mat. You will not
 * have access to the binary matrix directly.
 */

/**
 * @param {BinaryMatrix} binaryMatrix
 * @return {number}
 */
var leftMostColumnWithOne = function(binaryMatrix) {
  const [rows, cols] = binaryMatrix.dimensions();
  let result = -1;
  let row = 0;
  let col = cols - 1;
```

```
  while (row < rows && col >= 0) {
    if (binaryMatrix.get(row, col) === 1) {
      result = col;
      col--;
    } else {
      row++;
    }
  }

  return result;
};
```

1429 First Unique Number

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1429. First Unique Number
 * https://leetcode.com/problems/first-unique-number/
 * Difficulty: Medium
 *
 * You have a queue of integers, you need to retrieve the first unique integer in the queue.
 *
 * Implement the FirstUnique class:
 * - FirstUnique(int[] nums) Initializes the object with the numbers in the queue.
 * - int showFirstUnique() returns the value of the first unique integer of the queue, and
 *   returns -1 if there is no such integer.
 * - void add(int value) insert value to the queue.
 */

/**
* @param {number[]} nums
*/
var FirstUnique = function(nums) {

1432 Max Difference You Can Get From Changing An Integer

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1432. Max Difference You Can Get From Changing an Integer
 * https://leetcode.com/problems/max-difference-you-can-get-from-changing-an-integer/
 * Difficulty: Medium
 *
 * You are given an integer num. You will apply the following steps exactly two times:
 * - Pick a digit x (0 <= x <= 9).
 * - Pick another digit y (0 <= y <= 9). The digit y can be equal to x.
 * - Replace all the occurrences of x in the decimal representation of num by y.
 * - The new integer cannot have any leading zeros, also the new integer cannot be 0.
 *
 * Let a and b be the results of applying the operations to num the first and second times,
 * respectively.
 *
 * Return the max difference between a and b.
 */

/**
 * @param {number} num
 * @return {number}
 */

  }

  return sums[k - 1];
};
```

1441 Build An Array With Stack Operations

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1441. Build an Array With Stack Operations
 * https://leetcode.com/problems/build-an-array-with-stack-operations/
 * Difficulty: Medium
 *
 * You are given an integer array target and an integer n.
```

```
 *
 * You have an empty stack with the two following operations:
 * - "Push": pushes an integer to the top of the stack.
 * - "Pop": removes the integer on the top of the stack.
 *
 * You also have a stream of the integers in the range [1, n].
 *
 * Use the two stack operations to make the numbers in the stack (from the bottom to the top)
equal
 * to target. You should follow the following rules:
 * - If the stream of the integers is not empty, pick the next integer from the stream and
push it
 *   to the top of the stack.
 * - If the stack is not empty, pop the integer at the top of the stack.
 * - If, at any moment, the elements in the stack (from the bottom to the top) are equal to
target,
 *   do not read new integers from the stream and do not do more operations on the stack.
 *
 * Return the stack operations needed to build target following the mentioned rules. If there
are
 * multiple valid answers, return any of them.
 */

/**
 * @param {number[]} target
 * @param {number} n
 * @return {string[]}
 */
var buildArray = function(target, n) {

  }
  return shuffled;
};
```

1471 The K Strongest Values In An Array

MEDIUM

APPROACH NOTES

Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1471. The k Strongest Values in an Array
 * https://leetcode.com/problems/the-k-strongest-values-in-an-array/
 * Difficulty: Medium
 *
 * Given an array of integers arr and an integer k.
 *
 * A value arr[i] is said to be stronger than a value arr[j] if |arr[i] - m| > |arr[j] - m|
 * where m is the centre of the array.
 *
 * If |arr[i] - m| == |arr[j] - m|, then arr[i] is said to be stronger than arr[j]
 * if arr[i] > arr[j].
 *
 * Return a list of the strongest k values in the array. return the answer in any arbitrary
order.
 *
 * The centre is the middle value in an ordered integer list. More formally, if the length of
the
 * list is n, the centre is the element in position ((n - 1) / 2) in the sorted list
(0-indexed).
```

```
 * - For arr = [6, -3, 7, 2, 11], n = 5 and the centre is obtained by sorting the array
 *   arr = [-3, 2, 6, 7, 11] and the centre is arr[m] where m = ((5 - 1) / 2) = 2. The centre
is 6.
 * - For arr = [-7, 22, 17, 3], n = 4 and the centre is obtained by sorting the array
 *   arr = [-7, 3, 17, 22] and the centre is arr[m] where m = ((4 - 1) / 2) = 1. The centre is
 3.
 */

/**
 * @param {number[]} arr
 * @param {number} k
 * @return {number[]}
 */
var getStrongest = function(arr, k) {
  const sorted = arr.slice().sort((a, b) => a - b);
  const centre = sorted[Math.floor((sorted.length - 1) / 2)];

  return arr.sort((a, b) => {
    const diffA = Math.abs(a - centre);
    const diffB = Math.abs(b - centre);
    return diffA === diffB ? b - a : diffB - diffA;
  }).slice(0, k);
};
```

1472 Design Browser History

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1472. Design Browser History
 * https://leetcode.com/problems/design-browser-history/
 * Difficulty: Medium
 *
 * You have a browser of one tab where you start on the homepage and you
 * can visit another url, get back in the history number of steps or move
 * forward in the history number of steps.
 *
 * Implement the BrowserHistory class:
 *
 * - `BrowserHistory(string homepage)` Initializes the object with the
 *   homepage of the browser.
 * - `void visit(string url)` Visits url from the current page. It clears
 *   up all the forward history.
 * - `string back(int steps)` Move steps back in history. If you can only
 *   return x steps in the history and steps > x, you will return only x
 *   steps. Return the current url after moving back in history at most steps.
 * - `string forward(int steps)` Move steps forward in history. If you can
 *   only forward x steps in the history and steps > x, you will forward only
 *   x steps. Return the current url after forwarding in history at most steps.
 */

/**
 * @param {string} homepage
 */
var BrowserHistory = function(homepage) {
  this.history = [];
  this.cursor = -1;
  this.visit(homepage);
};

/**
 * @param {string} url
 * @return {void}
 */
BrowserHistory.prototype.visit = function(url) {
  this.history.splice(this.cursor + 1, this.history.length);
  this.history.push(url);
  this.cursor++;
};
```

```
/**
 * @param {number} steps
 * @return {string}
 */
BrowserHistory.prototype.back = function(steps) {

  return this.history[this.cursor];
};
```

1473 Paint House Iii

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1473. Paint House III
 * https://leetcode.com/problems/paint-house-iii/
 * Difficulty: Hard
 *
 * There is a row of m houses in a small city, each house must be painted with one of the n
 * colors (labeled from 1 to n), some houses that have been painted last summer should not
 * be painted again.
 *
 * A neighborhood is a maximal group of continuous houses that are painted with the same
color.
 *
 * For example: houses = [1,2,2,3,3,2,1,1] contains 5 neighborhoods [{1}, {2,2}, {3,3}, {2},
{1,1}].
 *
 * Given an array houses, an m x n matrix cost and an integer target where:
 * - houses[i]: is the color of the house i, and 0 if the house is not painted yet.
 * - cost[i][j]: is the cost of paint the house i with the color j + 1.
 *
 * Return the minimum cost of painting all the remaining houses in such a way that there are
exactly
 * target neighborhoods. If it is not possible, return -1.
 */

/**
 * @param {number[]} houses
 * @param {number[][]} cost
 * @param {number} m
 * @param {number} n
 * @param {number} target
 * @return {number}
 */

1489 Find Critical And Pseudo Critical Edges In Minimum Spanning Tree

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1489. Find Critical and Pseudo-Critical Edges in Minimum Spanning Tree
 * https://leetcode.com/problems/find-critical-and-pseudo-critical-edges-in-minimum-spanning-t
ree/
 * Difficulty: Hard
 *
 * Given a weighted undirected connected graph with n vertices numbered from 0 to n - 1, and
an
 * array edges where edges[i] = [ai, bi, weighti] represents a bidirectional and weighted edge
 * between nodes ai and bi. A minimum spanning tree (MST) is a subset of the graph's edges
that
 * connects all vertices without cycles and with the minimum possible total edge weight.
 *
 * Find all the critical and pseudo-critical edges in the given graph's minimum spanning tree
 * (MST). An MST edge whose deletion from the graph would cause the MST weight to increase is
 * called a critical edge. On the other hand, a pseudo-critical edge is that which can appear
 * in some MSTs but not all.
 *
 * Note that you can return the indices of the edges in any order.
 */

1500 Design A File Sharing System

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
```

```
 * 1500. Design a File Sharing System
 * https://leetcode.com/problems/design-a-file-sharing-system/
 * Difficulty: Medium
 *
 * We will use a file-sharing system to share a very large file which consists of m small
 * chunks with IDs from 1 to m.
 *
 * When users join the system, the system should assign a unique ID to them. The unique ID
 * should be used once for each user, but when a user leaves the system, the ID can be reused
again.
 *
 * Users can request a certain chunk of the file, the system should return a list of IDs of
 * all the users who own this chunk. If the user receives a non-empty list of IDs, they
receive
 * the requested chunk successfully.
 *
 * Implement the FileSharing class:
 * - FileSharing(int m) Initializes the object with a file of m chunks.
 * - int join(int[] ownedChunks): A new user joined the system owning some chunks of the file,
 *   the system should assign an id to the user which is the smallest positive integer not
 *   taken by any other user. Return the assigned id.
 * - void leave(int userID): The user with userID will leave the system, you cannot take file
 *   chunks from them anymore.
 * - int[] request(int userID, int chunkID): The user userID requested the file chunk with
chunkID.
 *   Return a list of the IDs of all users that own this chunk sorted in ascending order.
 */

```

1516 Move Sub Tree Of N Ary Tree

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1516. Move Sub-Tree of N-Ary Tree
```

```
 * https://leetcode.com/problems/move-sub-tree-of-n-ary-tree/
 * Difficulty: Hard
 *
 * Given the root of an N-ary tree of unique values, and two nodes of the tree p and q.
 *
 * You should move the subtree of the node p to become a direct child of node q. If p is
 * already a direct child of q, do not change anything. Node p must be the last child in
 * the children list of node q.
 *
 * Return the root of the tree after adjusting it.
 *
 * There are 3 cases for nodes p and q:
 * 1. Node q is in the sub-tree of node p.
 * 2. Node p is in the sub-tree of node q.
 * 3. Neither node p is in the sub-tree of node q nor node q is in the sub-tree of node p.
 *
 * In cases 2 and 3, you just need to move p (with its sub-tree) to be a child of q, but in
 * case 1 the tree may be disconnected, thus you need to reconnect the tree again. Please
 * read the examples carefully before solving this problem.
 *
 * Nary-Tree input serialization is represented in their level order traversal, each group
 * of children is separated by the null value (See examples).
 */

```

1524 Number Of Sub Arrays With Odd Sum

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1524. Number of Sub-arrays With Odd Sum
 * https://leetcode.com/problems/number-of-sub-arrays-with-odd-sum/
 * Difficulty: Medium
 *
 * Given an array of integers arr, return the number of subarrays with an odd sum.
 *
 * Since the answer can be very large, return it modulo 109 + 7.
 */

/**
 * @param {number[]} arr
 * @return {number}
 */
var numOfSubarrays = function(arr) {
  let even = 0;
  let odd = 0;

  for (let i = 0, total = 0; i < arr.length; i++) {
    total += arr[i];
    odd += +(total % 2 === 1);
    even += +(total % 2 === 0);
  }

  return (odd * even + odd) % (1e9 + 7);
};
```

1525 Number Of Good Ways To Split A String

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1525. Number of Good Ways to Split a String
 * https://leetcode.com/problems/number-of-good-ways-to-split-a-string/
 * Difficulty: Medium
 *
 * You are given a string s.
 *
 * A split is called good if you can split s into two non-empty strings sleft and sright where
 * their concatenation is equal to s (i.e., sleft + sright = s) and the number of distinct
letters
 * in sleft and sright is the same.
 *
 * Return the number of good splits you can make in s.
 */
```

```
/**
 * @param {string} s
 * @return {number}
 */
var numSplits = function(s) {
  const leftDistinct = new Map();
  const rightDistinct = new Map();
  let result = 0;

};
```

1531 String Compression Ii

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1531. String Compression II
 * https://leetcode.com/problems/string-compression-ii/
```

```
 * Difficulty: Hard
 *
 * Run-length encoding is a string compression method that works by replacing consecutive
 * identical characters (repeated 2 or more times) with the concatenation of the character
 * and the number marking the count of the characters (length of the run). For example,
 * to compress the string "aabccc" we replace "aa" by "a2" and replace "ccc" by "c3". Thus
 * the compressed string becomes "a2bc3".
 *
 * Notice that in this problem, we are not adding '1' after single characters.
 *
 * Given a string s and an integer k. You need to delete at most k characters from s such that
 * the run-length encoded version of s has minimum length.
 *
 * Find the minimum length of the run-length encoded version of s after deleting at most
 * k characters.
 */

/**
 * @param {string} s
 * @param {number} k
 * @return {number}
 */

1541 Minimum Insertions To Balance A Parentheses String

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1541. Minimum Insertions to Balance a Parentheses String
 * https://leetcode.com/problems/minimum-insertions-to-balance-a-parentheses-string/
 * Difficulty: Medium
 *
 * Given a parentheses string s containing only the characters '(' and ')'. A parentheses
string
 * is balanced if:
 * - Any left parenthesis '(' must have a corresponding two consecutive right parenthesis
'))'.
 * - Left parenthesis '(' must go before the corresponding two consecutive right parenthesis
'))'.
 *
 * In other words, we treat '(' as an opening parenthesis and '))' as a closing parenthesis.
 * - For example, "())", "())(())))" and "(())())))" are balanced, ")()", "()))" and "((()))"
are
 *   not balanced.
 *
 * You can insert the characters '(' and ')' at any position of the string to balance it if
needed.
 *
 * Return the minimum number of insertions needed to make s balanced.
 */

/**
 * @param {string} s
```

```
 * @return {number}
 */

1544 Make The String Great

EASY

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1544. Make The String Great
 * https://leetcode.com/problems/make-the-string-great/
 * Difficulty: Easy
 *
 * Given a string s of lower and upper case English letters.
 *
 * A good string is a string which doesn't have two adjacent characters s[i] and s[i + 1]
where:
 * - 0 <= i <= s.length - 2
 * - s[i] is a lower-case letter and s[i + 1] is the same letter but in upper-case or
vice-versa.
 *
 * To make the string good, you can choose two adjacent characters that make the string bad
and
 * remove them. You can keep doing this until the string becomes good.
 *
 * Return the string after making it good. The answer is guaranteed to be unique under the
given
 * constraints.
 *
 * Notice that an empty string is also good.
 */

/**
 * @param {string} s
 * @return {string}
 */

    } else {
      stack.push(char);
    }
  }

  return stack.join('');
};
```

1545 Find Kth Bit In Nth Binary String

MEDIUM

APPROACH NOTES

Contains a while loop: identify the progress condition.

SOURCE CODE

```
/**
 * 1545. Find Kth Bit in Nth Binary String
 * https://leetcode.com/problems/find-kth-bit-in-nth-binary-string/
 * Difficulty: Medium
 *
 * Given two positive integers n and k, the binary string Sn is formed as follows:
 * - S1 = "0"
 * - Si = Si - 1 + "1" + reverse(invert(Si - 1)) for i > 1
 *
```

```
 * Where + denotes the concatenation operation, reverse(x) returns the reversed string x, and
 * invert(x) inverts all the bits in x (0 changes to 1 and 1 changes to 0).
 *
 * For example, the first four strings in the above sequence are:
 * - S1 = "0"
 * - S2 = "011"
 * - S3 = "0111001"
 * - S4 = "011100110110001"
 *
 * Return the kth bit in Sn. It is guaranteed that k is valid for the given n.
 */

/**
 * @param {number} n
 * @param {number} k
 * @return {character}
 */

```

1547 Minimum Cost To Cut A Stick

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1547. Minimum Cost to Cut a Stick
 * https://leetcode.com/problems/minimum-cost-to-cut-a-stick/
 * Difficulty: Hard
 *
 * Given a wooden stick of length n units. The stick is labelled from 0 to n. For example, a
 * stick of length 6 is labelled as follows.
 *
 * Given an integer array cuts where cuts[i] denotes a position you should perform a cut at.
 *
 * You should perform the cuts in order, you can change the order of the cuts as you wish.
 *
 * The cost of one cut is the length of the stick to be cut, the total cost is the sum of
costs
 * of all cuts. When you cut a stick, it will be split into two smaller sticks (i.e. the sum
of
 * their lengths is the length of the stick before the cut). Please refer to the first example
 * for a better explanation.
 *
 * Return the minimum total cost of the cuts.
 */

/**
 * @param {number} n
 * @param {number[]} cuts
 * @return {number}
 */

1561 Maximum Number Of Coins You Can Get

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant. Sorts data: inspect the comparator and sorting cost.

SOURCE CODE

```
/**
 * 1561. Maximum Number of Coins You Can Get
 * https://leetcode.com/problems/maximum-number-of-coins-you-can-get/
 * Difficulty: Medium
 *
```

```
 * There are 3n piles of coins of varying size, you and your friends will take piles of coins
as
 * follows:
 * - In each step, you will choose any 3 piles of coins (not necessarily consecutive).
 * - Of your choice, Alice will pick the pile with the maximum number of coins.
 * - You will pick the next pile with the maximum number of coins.
 * - Your friend Bob will pick the last pile.
 * - Repeat until there are no more piles of coins.
 *
 * Given an array of integers piles where piles[i] is the number of coins in the ith pile.
 *
 * Return the maximum number of coins that you can have.
 */

/**
 * @param {number[]} piles
 * @return {number}
 */
var maxCoins = function(piles) {
  piles.sort((a, b) => b - a);
  let result = 0;
  const rounds = piles.length / 3;

  for (let i = 1; i < piles.length - rounds; i += 2) {
    result += piles[i];
  }

  return result;
};
```

1562 Find Latest Group Of Size M

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1562. Find Latest Group of Size M
 * https://leetcode.com/problems/find-latest-group-of-size-m/
 * Difficulty: Medium
 *
 * Given an array arr that represents a permutation of numbers from 1 to n.
 *
 * You have a binary string of size n that initially has all its bits set to zero. At each
step
 * i (assuming both the binary string and arr are 1-indexed) from 1 to n, the bit at position
 * arr[i] is set to 1.
 *
 * You are also given an integer m. Find the latest step at which there exists a group of ones
 * of length m. A group of ones is a contiguous substring of 1's such that it cannot be
extended
 * in either direction.
 *
 * Return the latest step at which there exists a group of ones of length exactly m. If no
such
 * group exists, return -1.
 */

/**
 * @param {number[]} arr
 * @param {number} m
 * @return {number}
 */

    const pos = arr[step];
    const left = lengths[pos - 1];
    const right = lengths[pos + 1];
```

```
    const newLength = left + right + 1;

    lengths[pos - left] = newLength;
    lengths[pos + right] = newLength;
    lengths[pos] = newLength;

    count.set(left, (count.get(left) || 0) - 1);
    count.set(right, (count.get(right) || 0) - 1);
    count.set(newLength, (count.get(newLength) || 0) + 1);

    if (count.get(m) > 0) result = step + 1;
  }

  return result;
};
```

1563 Stone Game V

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1563. Stone Game V
 * https://leetcode.com/problems/stone-game-v/
 * Difficulty: Hard
 *
 * There are several stones arranged in a row, and each stone has an associated value which
 * is an integer given in the array stoneValue.
 *
 * In each round of the game, Alice divides the row into two non-empty rows (i.e. left row and
 * right row), then Bob calculates the value of each row which is the sum of the values of all
 * the stones in this row. Bob throws away the row which has the maximum value, and Alice's
 * score increases by the value of the remaining row. If the value of the two rows are equal,
 * Bob lets Alice decide which row will be thrown away. The next round starts with the
remaining
 * row.
 *
 * The game ends when there is only one stone remaining. Alice's is initially zero.
 *
 * Return the maximum score that Alice can obtain.
 */

/**
 * @param {number[]} stoneValue
 * @return {number}
 */
var stoneGameV = function(stoneValue) {
  const n = stoneValue.length;

1586 Binary Search Tree Iterator Ii

MEDIUM

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1586. Binary Search Tree Iterator II
 * https://leetcode.com/problems/binary-search-tree-iterator-ii/
 * Difficulty: Medium
 *
 * Implement the BSTIterator class that represents an iterator over the in-order traversal
 * of a binary search tree (BST):
 * - BSTIterator(TreeNode root) Initializes an object of the BSTIterator class. The root of
the
 *   BST is given as part of the constructor. The pointer should be initialized to a
non-existent
 *   number smaller than any element in the BST.
 * - boolean hasNext() Returns true if there exists a number in the traversal to the right of
the
 *   pointer, otherwise returns false.
 * - int next() Moves the pointer to the right, then returns the number at the pointer.
 * - boolean hasPrev() Returns true if there exists a number in the traversal to the left of
the
 *   pointer, otherwise returns false.
 * - int prev() Moves the pointer to the left, then returns the number at the pointer.
 *
 * Notice that by initializing the pointer to a non-existent smallest number, the first call
to
 * next() will return the smallest element in the BST.
 *
 * You may assume that next() and prev() calls will always be valid. That is, there will be at
 * least a next/previous number in the in-order traversal when next()/prev() is called.
 */

```

1592 Rearrange Spaces Between Words

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1592. Rearrange Spaces Between Words
 * https://leetcode.com/problems/rearrange-spaces-between-words/
 * Difficulty: Easy
 *
 * You are given a string text of words that are placed among some number of spaces. Each word
 * consists of one or more lowercase English letters and are separated by at least one space.
 * It's guaranteed that text contains at least one word.
 *
 * Rearrange the spaces so that there is an equal number of spaces between every pair of
adjacent
 * words and that number is maximized. If you cannot redistribute all the spaces equally,
place
 * the extra spaces at the end, meaning the returned string should be the same length as text.
 *
 * Return the string after rearranging the spaces.
 */

/**
 * @param {string} text
 * @return {string}
 */
var reorderSpaces = function(text) {
  const words = text.trim().split(/\s+/);
  const spaceCount = text.length - words.join('').length;
  const wordCount = words.length;

  if (wordCount === 1) return words[0] + ' '.repeat(spaceCount);

  const spacesBetween = Math.floor(spaceCount / (wordCount - 1));
  const extraSpaces = spaceCount % (wordCount - 1);

  return words.join(' '.repeat(spacesBetween)) + ' '.repeat(extraSpaces);
};
```

1593 Split A String Into The Max Number Of Unique Substrings

MEDIUM

APPROACH NOTES

Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1593. Split a String Into the Max Number of Unique Substrings
```

```
 * https://leetcode.com/problems/split-a-string-into-the-max-number-of-unique-substrings/
 * Difficulty: Medium
 *
 * Given a string s, return the maximum number of unique substrings that the given string can
 * be split into.
 *
 * You can split string s into any list of non-empty substrings, where the concatenation of
 * the substrings forms the original string. However, you must split the substrings such that
 * all of them are unique.
 *
 * A substring is a contiguous sequence of characters within a string.
 */

/**
 * @param {string} s
 * @return {number}
 */
var maxUniqueSplit = function(s) {
  return backtrack(0, new Set());

  function backtrack(start, seen) {
    if (start === s.length) return seen.size;

    let maxSplits = 0;
    for (let end = start + 1; end <= s.length; end++) {
      const substring = s.slice(start, end);
      if (!seen.has(substring)) {
        seen.add(substring);
        maxSplits = Math.max(maxSplits, backtrack(end, seen));
        seen.delete(substring);
      }
    }

    return maxSplits;
  }
};
```

1594 Maximum Non Negative Product In A Matrix

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1594. Maximum Non Negative Product in a Matrix
 * https://leetcode.com/problems/maximum-non-negative-product-in-a-matrix/
 * Difficulty: Medium
 *
 * You are given a m x n matrix grid. Initially, you are located at the top-left corner (0,
0),
 * and in each step, you can only move right or down in the matrix.
 *
 * Among all possible paths starting from the top-left corner (0, 0) and ending in the
bottom-right
 * corner (m - 1, n - 1), find the path with the maximum non-negative product. The product of
a
 * path is the product of all integers in the grid cells visited along the path.
 *
 * Return the maximum non-negative product modulo 109 + 7. If the maximum product is negative,
 * return -1.
 *
 * Notice that the modulo is performed after getting the maximum product.
 */

/**
 * @param {number[][]} grid
 * @return {number}
 */
var maxProductPath = function(grid) {

          maxProduct,
          dp[row][col - 1][0] * grid[row][col],
          dp[row][col - 1][1] * grid[row][col]
        );
      }

      dp[row][col] = [minProduct, maxProduct];
    }
  }

  const maxResult = dp[rows - 1][cols - 1][1];
  return maxResult < 0 ? -1 : maxResult % (10 ** 9 + 7);
};
```

1595 Minimum Cost To Connect Two Groups Of Points

HARD

APPROACH NOTES

Contains iteration: trace the loop invariant. Look for depth-first traversal and recursion.

SOURCE CODE

```
/**
 * 1595. Minimum Cost to Connect Two Groups of Points
 * https://leetcode.com/problems/minimum-cost-to-connect-two-groups-of-points/
 * Difficulty: Hard
 *
 * You are given two groups of points where the first group has size1 points, the second group
 * has size2 points, and size1 >= size2.
 *
 * The cost of the connection between any two points are given in an size1 x size2 matrix
where
 * cost[i][j] is the cost of connecting point i of the first group and point j of the second
group.
 * The groups are connected if each point in both groups is connected to one or more points in
 the
 * opposite group. In other words, each point in the first group must be connected to at least
 one
 * point in the second group, and each point in the second group must be connected to at least
 one
 * point in the first group.
 *
```

```
 * Return the minimum cost it takes to connect the two groups.
 */

/**

```

1597 Build Binary Expression Tree From Infix Expression

HARD

APPROACH NOTES

Uses a Map for keyed lookups. Contains a while loop: identify the progress condition. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1597. Build Binary Expression Tree From Infix Expression
 * https://leetcode.com/problems/build-binary-expression-tree-from-infix-expression/
 * Difficulty: Hard
 *
 * A binary expression tree is a kind of binary tree used to represent arithmetic expressions.
 * Each node of a binary expression tree has either zero or two children. Leaf nodes (nodes
 * with 0 children) correspond to operands (numbers), and internal nodes (nodes with 2
children)
 * correspond to the operators '+' (addition), '-' (subtraction), '*' (multiplication), and
 * '/' (division).
 *
 * For each internal node with operator o, the infix expression it represents is (A o B),
 * where A is the expression the left subtree represents and B is the expression the right
 * subtree represents.
 *
```

```
 * You are given a string s, an infix expression containing operands, the operators described
 * above, and parentheses '(' and ')'.
 *
 * Return any valid binary expression tree, whose in-order traversal reproduces s after
omitting
 * the parenthesis from it.
 *
 * Please note that order of operations applies in s. That is, expressions in parentheses are
 * evaluated first, and multiplication and division happen before addition and subtraction.
 *
 * Operands must also appear in the same order in both s and the in-order traversal of the
tree.
 */

/**
 * Definition for a binary tree node.
 * function Node(val, left, right) {
 *     this.val = (val===undefined ? " " : val)
 *     this.left = (left===undefined ? null : left)
 *     this.right = (right===undefined ? null : right)
 * }
 */
/**
 * @param {string} s
 * @return {Node}
 */

1598 Crawler Log Folder

EASY

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1598. Crawler Log Folder
 * https://leetcode.com/problems/crawler-log-folder/
 * Difficulty: Easy
 *
 * The Leetcode file system keeps a log each time some user performs
 * a change folder operation.
 *
 * The operations are described below:
 *
 * - `"../"` : Move to the parent folder of the current folder. (If
 *   you are already in the main folder, remain in the same folder).
 * - `"./"` : Remain in the same folder.
 * - `"x/"` : Move to the child folder named x (This folder is
 *   guaranteed to always exist).
 *
 * You are given a list of strings logs where logs[i] is the operation
 * performed by the user at the ith step.
 *
 * The file system starts in the main folder, then the operations in
 * logs are performed.
 *
 * Return the minimum number of operations needed to go back to the
 * main folder after the change folder operations.
 */

/**
 * @param {string[]} logs
 * @return {number}
 */
var minOperations = function(logs) {

    Math.max(0, depth + (log === '../' ? -1 : log === './' ? 0 : 1)), 0
  );
};
```

1599 Maximum Profit Of Operating A Centennial Wheel

MEDIUM

APPROACH NOTES

Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1599. Maximum Profit of Operating a Centennial Wheel
 * https://leetcode.com/problems/maximum-profit-of-operating-a-centennial-wheel/
 * Difficulty: Medium
 *
 * You are the operator of a Centennial Wheel that has four gondolas, and each gondola has
room for
 * up to four people. You have the ability to rotate the gondolas counterclockwise, which
costs you
 * runningCost dollars.
 *
 * You are given an array customers of length n where customers[i] is the number of new
customers
 * arriving just before the ith rotation (0-indexed). This means you must rotate the wheel i
times
 * before the customers[i] customers arrive. You cannot make customers wait if there is room
in the
 * gondola. Each customer pays boardingCost dollars when they board on the gondola closest to
the
 * ground and will exit once that gondola reaches the ground again.
 *
```

```
 * You can stop the wheel at any time, including before serving all customers. If you decide
to stop
 * serving customers, all subsequent rotations are free in order to get all the customers down
 * safely. Note that if there are currently more than four customers waiting at the wheel,
only
 * four will board the gondola, and the rest will wait for the next rotation.
 *
 * Return the minimum number of rotations you need to perform to maximize your profit. If
there is
 * no scenario where the profit is positive, return -1.
 */

/**
 * @param {number[]} customers
 * @param {number} boardingCost
 * @param {number} runningCost
 * @return {number}
 */
var minOperationsMaxProfit = function(customers, boardingCost, runningCost) {
  let waitingCustomers = 0;
  let totalBoarded = 0;
  let maxProfit = -Infinity;
  let rotationAtMaxProfit = -1;
  let currentProfit = 0;
  let rotations = 0;

  const gondolaCapacity = 4;

  for (let i = 0; i < customers.length || waitingCustomers > 0; i++) {
    rotations++;

    if (i < customers.length) {
      waitingCustomers += customers[i];
    }

    const boarding = Math.min(waitingCustomers, gondolaCapacity);
    waitingCustomers -= boarding;
    totalBoarded += boarding;

    currentProfit = totalBoarded * boardingCost - rotations * runningCost;

    if (currentProfit > maxProfit) {
      maxProfit = currentProfit;
      rotationAtMaxProfit = rotations;
    }
  }

  return maxProfit > 0 ? rotationAtMaxProfit : -1;
};
```

1600 Throne Inheritance

MEDIUM

APPROACH NOTES

Uses a Map for keyed lookups. Uses a Set for unique membership. Contains iteration: trace the loop invariant.

SOURCE CODE

```
/**
 * 1600. Throne Inheritance
 * https://leetcode.com/problems/throne-inheritance/
 * Difficulty: Medium
 *
 * A kingdom consists of a king, his children, his grandchildren, and so on. Every once in a
while,
 * someone in the family dies or a child is born.
 *
 * The kingdom has a well-defined order of inheritance that consists of the king as the first
 * member. Let's define the recursive function Successor(x, curOrder), which given a person x
and
 * the inheritance order so far, returns who should be the next person after x in the order of
 * inheritance.
 *
 * For example, assume we have a kingdom that consists of the king, his children Alice and Bob
```

```
 * (Alice is older than Bob), and finally Alice's son Jack.
 *
 * 1. In the beginning, curOrder will be ["king"].
 * 2. Calling Successor(king, curOrder) will return Alice, so we append to curOrder to
 *    get ["king", "Alice"].
 * 3. Calling Successor(Alice, curOrder) will return Jack, so we append to curOrder to
 *    get ["king", "Alice", "Jack"].
 * 4. Calling Successor(Jack, curOrder) will return Bob, so we append to curOrder to
 *    get ["king", "Alice", "Jack", "Bob"].
 * 5. Calling Successor(Bob, curOrder) will return null. Thus the order of inheritance
 *    will be ["king", "Alice", "Jack", "Bob"].
 *
 * Using the above function, we can always obtain a unique order of inheritance.
 *
 * Implement the ThroneInheritance class:
 * - ThroneInheritance(string kingName) Initializes an object of the ThroneInheritance class.
 *   The name of the king is given as part of the constructor.
 * - void birth(string parentName, string childName) Indicates that parentName gave birth
 *   to childName.
 * - void death(string name) Indicates the death of name. The death of the person doesn't
 *   affect the Successor function nor the current inheritance order. You can treat it as
 *   just marking the person as dead.
 * - string[] getInheritanceOrder() Returns a list representing the current order of
inheritance
 *   excluding dead people.
 */

/**
 * @param {string} kingName
 */
var ThroneInheritance = function(kingName) {
  this.king = kingName;
  this.familyTree = new Map();
  this.deceased = new Set();
};

/**
 * @param {string} parentName
 * @param {string} childName
 * @return {void}
 */
ThroneInheritance.prototype.birth = function(parentName, childName) {
  if (!this.familyTree.has(parentName)) {
    this.familyTree.set(parentName, []);
  }
  this.familyTree.get(parentName).push(childName);
};

/**
 * @param {string} name
 * @return {void}
 */
ThroneInheritance.prototype.death = function(name) {
  this.deceased.add(name);
};

/**
 * @return {string[]}
 */
ThroneInheritance.prototype.getInheritanceOrder = function() {
  const result = [];
  const traverse = (person) => {
    if (!this.deceased.has(person)) {
      result.push(person);
    }
    const children = this.familyTree.get(person) || [];
    for (const child of children) {
      traverse(child);
    }
  };
  traverse(this.king);
  return result;
};
```

1601 Maximum Number Of Achievable Transfer Requests

HARD

APPROACH NOTES

Trace the function from its parameters to its return value; write down intermediate states.

SOURCE CODE

```
/**
 * 1601. Maximum Number of Achievable Transfer Requests
 * https://leetcode.com/problems/maximum-number-of-achievable-transfer-requests/
 * Difficulty: Hard
 *
 * We have n buildings numbered from 0 to n - 1. Each building has a number of employees.
 * It's transfer season, and some employees want to change the building they reside in.
 *
